We are yielding to convictions of the causativeness of planetary conjunctions and may get our rebellious moods into harmony with the precepts of the great Santa Clara spotter and conjunctor—for it may yet appear to us as the harmony of the spheres. For did not Jupiter and Venus tango down the western sky on Sunday evening last, in as close embrace as, perhaps, this generation will dare to look upon, and was not Monday as delicious a February day as even Californians ever fill their eyes and hearts with? Did not the glorious sun send broad beams of heat and light through our clear, rain-washed winter air until acacias and daffodils threw back upon his gleaming face even a deeper golden-glow than that of his unfolding? And did not these grateful blossoms surcharge the air with entrancing perfumes—their tribute of incense-worship to the beneficence of their greatest planetary relation! Yes, we are being moved towards wider recognition of our earth's dependence upon her planetary environment—the greatest co-operation in the visible universe. But why have priests and prophets from prehistoric times found tokens or causes of evil in these celestial phenomena, which are but necessary phases of operation of the universe and held in beneficent sequence by the Author of it? No answer can be found to such a question except in the assumption of inexplicable darkness in the human mind, which neither revelation, science, nor experience have yet fully illumined—the lingering vestige of original sin in the human soul, which fails to comprehend its God, cravenly fears its devil and enfolds itself in superstitution, even to dimming the effulgence of California February sunshine!

Our War Is Not Getting On.

We are not surprised that our readers are manifesting some discontent with the article of war we are giving them. We had hoped to get the belligerents out of their trenches and chasing each other across the landscape before Washington's Birthday, but they are still securely dug in. Our air-men report that the commanders are playing seven-up in a connecting gallery, and they cannot get even the score of that because they are playing under an umbrella. It is really sickening to think that we have only succeeded in bringing on such a war as that, and really we do not care much how soon the pacificists drive them off the field. We are quite in sympathy with a reader who writes in this way:

Deer Rooral: You have put on the bummest fite sence the Jefrey Fitshimmon eskepod up tu Reno. It looks tu me that wun ov youre kunels is afrade an 'tother dassent. I'm razin mony to hire Wm. Jenny Bryne tu cum over and throw wun ov his Shotaway sirkits tu wake up yure kunels. My nabor, Burrick, kin put up a better fite fur piece than yure kunels kin fur war.—Pacific-ist, Pacific Grov.

Well, as we said about this war, there is only one certain thing about it, and that is that we started it—and that is more than any one will say about the European war. Fortunately, our readers are dropping bombs on the commanders, as other pages of this issue show. It is everybody's chance to do some fighting now on the general subject of whether they want paternalism or not, and if nobody strikes in, we shall have to decide that this question belongs to unsolved war-problems like the question of who struck William Patterson.

A Worsted King.

Speaking about war: although it does not yet clearly appear which bunch of allies, central or exterior, will take a final fall from the other, there can be no doubt which king is getting the worst of it—for it is King Alcohol. The exterior allies seem to be hitting him hardest; probably because some of them have drunk harder stuff than the wines of France and Italy and the beer of Germany. However, the first great drive against alcohol was made by the Russians on "vodka," which we understand to be a beverage of pronounced forty-rod type. The czar began some years ago by bringing all the vodka under government control, and dispensed it in government saloons, closing all others. It was supposed to be a great government scheme for revenue-monopoly—and perhaps it was, but the control of selling worked well when the prohibition of vodka was ordered as a war measure, for as there were no private dispensaries, the temptation to breed "blind pigs" was small and remote. The government first had it all and then sold it all and then stopped it all. But England was a close second to Russia in the drive on King Alcohol, and hedged him very close, and this week we read that the British government will immediately take over all the large whisky distilleries and use them as munitions factories, and the account adds that "the step will be facilitated by the fact that the Government intends to prohibit the importation of barley for distilling purposes." We do not really see how the government can tell by the looks of a cargo of California barley whether it is going finally to a brewery or to a distillery, but perhaps George knows more about it than we do. Perhaps, also, he thinks if he stops distilling there will be enough home-grown barley for beer. But even so, why does he jump to an embargo on barley to check distilling? He ought to know more than he seems to about rye, corn and wheat whiskey. A Kentucky colonel, sur, can tell him more about that than our two colonels seem to be telling us about anything!

Will It Be a Baffle on Barley?

We ought to harvest about thirty million dollars' worth of barley this year. It is customary to ship about half the crop to foreign markets when the wind is good, the Panama free of mud, and the ocean of submarines. We managed to get out about eight million dollars' worth of it by sea last year when the wind was about the only free thing, and the chance of doing even better this year seems good—except for the report of a British embargo on barley. That is a thing which barley-growers ought to be looking into on their own account, for if they do not do something to expose some error in the report or do something else to assure an outlet for the surplus, the buyers will pound opening prices for the new barley crop into road-metal. This sort of thing is always coming up—last year it was prunes and peaches; this year it may be barley and, perhaps, something else. Why cannot growers of a crop understand that if they are to get fair money out of a crop they must fight for it. We do not say they must control and price it. It takes a rare condition like that of the raisin makers, which we are discussing on other pages of this issue, to enable producers to do that. But they can defend their crop; they can find out what affects the sale of it. and they can submarine the pirates in the channels of trade. Col. Irish says they can do that for themselves and get taller as citizens. Col. Weinstock says the State will do it for them, and make them bigger where the belt goes around. We don't care which colonel does it so long as it gets done, for we can see that it must be done. California is the biggest barley State in the Union, bigger than any other by ten million bushels. Now, then, comes this bruise of a British embargo on barley. What are we going to do about it? We are likely to be hard hit on barley. As we write, the Canadian frontier, across from Buffalo, is bristling with bayonets, for the Kanucks fear a hyphenate-invasion. If those hyphenates really get to going through Canada they will drink up all the Canadian beer and leave Milwaukee and St. Louis dry: that will cut off our chance of rail exports of barley to the Mississippi valley. And so we stand a chance of being hit, both by land and sea. President Wilson should include California barley in his case against England, and write a letter about it. He ought to tell Earl Grey that if he is unfair to California barley, we will bore a hole through the earth and deliver it by pipe line to the Munich breweries. Something must be done and producers are really the only ones who have fundamental interest enough in it to make things hot.

A Nice Question of Alliance.

But California may possibly be drawn into foreign war on a more delicate question than fair trade in beer-stuffs. Possibly we may have the battle-ground on which the exterior allies will settle their internal differences. The story is that there is a consignment of cute little green silk flags held up at the San Fran-

cisco customs house because the name of the country of manufacture, Japan, is not printed thereon. The flags were brought here for the Hibernia Bank, and are intended for distribution among the friends of the bank for St. Patrick's Day next month. The name of the Hibernia Bank and Erin Go Bragh are printed above and below the harp, but not the name of the nation where the printing was done, as the law requires. "And is it 'Erin Go Bragh—Made in Japan,' yez say: the durty haythen!" It seems to be a new and rather delicate case of hyphenation.

More People; More Fruit.

The census office at Washington issues this week its estimate that the population of the United States on January 1st was 101,208,315, and that by July 1st it would be 102,017,302. On July 1st last year they figured the population at 100,399,318. This would indicate that this country is growing faster than one and a half millions a year, and we have the conviction that its ability and capacity for good living is growing far faster than that. Both these facts have direct bearing upon the coming demand in this country for the special, high-class food products which California is developing for consumption beyond State lines. This is very important to us in view of our increasing investment in such production. In our next week's issue we will print a tabulation of the present and coming volume of our fruit production prepared by G. P. Weldon, deputy State Horticultural Commissioner, with great care and energy. It should be carefully studied and held convenient for frequent reference.

Higher Sphere for Horticultural Officers.

Last week we briefly presented the suggestion that our county horticultural service was doing too much in the way of local quarantines, which impeached its value in inspection and made people trouble without just cause or reason. On this subject we receive the following note:

To the Editor: I am much interested in your editorial on inspection and geographical quarantine of Feb. 12. I believe with you that your multiplying local ordinances will soon make a general overhauling necessary. It may be of interest to you to read an article which I contributed sometime ago to the Sacramento Bee. This explains to a certain extent the unfortunate condition under which the County Horticultural Commissioner is working. On the one side, he finds the Farm Adviser encroaching on his territory—and rightfully so—and on the other side he does not get the support that he ought to have from those who are most interested in the success of his work. I believe that, with Colonel Weinstock's aid, the much neglected work of standardization will soon be taken up once more, and if we then insist upon a better control of our weed pests, we will find enough activity for the county commissioner to make a better showing than he has done in the past; and with more activities to call upon his time, he will be less concerned about the multiplication of local ordinances that cause the justified complaints by nurserymen and intending planters.—G. H. Hecke, Woodland.

Mr. Hecke, who is well known as county horticultural commissioner for Yolo county, certainly writes from much experience and careful thought. In the article to which he refers, he advises close inspection at entry points of all inter-State railways—both of personal effects and mail parcels and co-operation with provisions of national law for pest exclusions. This would relieve the county officers of much work which they now do and which should be obviated by a better State quarantine service—that is one which covers unguarded directions of approach. Then the county officers could discharge duties which would count more for the promotion of regulated trade in fruit under State executive auspices. This matter certainly should receive careful attention by all those whose industries are affected and by all who are otherwise interested in the horticultural development of the State.

Queries and Replies.

Querists must give name and address.

A Quick Rotation.

To the Editor: Can I put Egyptian corn in barley ground after the barley has been harvested, which will be about the first of June? Would it be all right to plant some kind of peas or something else that would make a good feed after the corn was harvested? This ground can be irrigated, and it is the best kind of land.—H. D., Woodland.

Yes. on that kind of land, with water you can get a three-crop rotation in a year. almost. Irrigate and plow in your barley stubble deeply and straight-disk it down well. Drill in the Egyptian in wide rows and cultivate, irrigating also, if necessary, to get good height. This will bring you to September, when you can irrigate and plow shallow, or disk in the peas or vetches, after clearing off the 'gyp stubble. They will make you late fall pasture. This scheme will keep you jumping, but you can do it.

Galleta—A Valuable Desert Grass.

To the Editor: Will you give information on the value of "gietta" grass at a forage for sheep?—E. S. K., Nyland.

We presume that the name you use is a synonym of "galleta," which in its Spanish pronunciation would have a somewhat similar sound. Galleta is a desert grass, growing from Southern Nevada, Arizona and Southeastern California southward into Mexico. Botanically, it is Haltica rigida. It is described as a coarse, much branched and woody perennial. It belongs to the same genus as the "creeping mesquite," "black grama," and other grasses of the same region. Griffith, in his Range Investigations in Arizona says: "Galleta is an important grass throughout Arizona. It nearly always occupies swales or depressions, and for its best development gets one or more irrigation by flood water during the year. Small areas will sometimes cut a quarter of a ton of hay to the acre. In the northern portion of Arizona it must be considered one of the most important grasses. It is often grazed to the ground continuously." We have at hand no analyses of the plant, but its practical value seems to be fully demonstrated.

Growing Castor Beans.

To the Editor: Kindly give information regarding castor beans as a commercial crop in California, and if there is a mill or market here for them. I am versed with the growing, handling and marketing of them in the Middle West and I believe they would prove a good crop here, especially on the black lands, as they will grow with very little moisture and the expense of growing and harvesting is very small. The weather for curing and threshing is ideal in this county, also a great many other counties of the State where the frost is not too early or late. It takes about 60 to 70 days for the first spikes to mature and they will keep fruiting until frost.—E. J. D., San Joaquin Co.

There were more castor beans grown in California forty years ago than there have ever been since. The price has always been limited by what oil-makers had to pay for East Indian beans laid down here from Calcutta, and that was too low to meet high labor cost in California. Those thinking of the crop now should find out what contract price the San Francisco oil mills will make on the beans; possibly they are now high enough to make the crop pay. Our correspondent is right about the long ripening and drying season in California, but the crop requires much hand labor cutting the clusters as they reach condition all through the fall, and in drying the clusters so the beans will pop out. The whole business is not so easy as our correspondent thinks, but it is worth looking into because the war has castor oil coming up when it ought to stay down to do its work.

Why Most Potatoes Fail.

To the Editor: I would like to know what kind of fertilizer will be good for potatoes in this part of the country? The soil is a light sandy loam. There are potatoes enough to the hill, but they do not get large enough.—G. L. R., Shafter.

Are you sure that you planted early enough? We have been dinging away on this proposition for three or four decades, and yet people will keep planting potatoes on mesas and plains in the spring when the plant should be already well grown by that time and making tubers. Nearly twenty years ago, in the first edition of our "California Vegetables," we said this: "In parts of the state where there are high heat and drouth or the soil becomes dry even with moderate heat, planting must be undertaken early enough to allow a large part of the development of the plant before such stress comes. Local failures with potatoes may, therefore, be often attributed to neglect of planting as soon as moisture and temperature conditions favor growth in each locality."

In your county last year L. O. Haupt, who won the prize in the High School contest, planted in February. It is often desirable to plant in January in places of moderate rainfall. On moist lands, in moderate heat and moist air, potatoes can be planted all summer, but this does not justify late planting on plains or mesas. At elevations in the foothills and mountains late planting may also be done with irrigation. This means that we apprehend that your plants failed to make large potatoes because they did not have a chance to make more growth in cool, moist air. However, if it is really fertilizers that you need, read the experience of the Exposition prize winners. the Boa Vista ranch of Eldorado coun,ty as printed in detail in the Pacific Rural Press of December 25 last. Plenty of stable manure, plowed in some months before planting, followed by application of a "complete fertilizer, such as any of our firms advertising fertilizers can supply you, will insure large potatoes—providing you plant early enough to get a strong plant to produce them, or supply moisture by irrigation to keep the plant at work. If you want rainfall potatoes you must have them making most growth while it rains, unless you are on low, moist land.

GROWING FRUIT ON LEMON SUCKERS.

How Pruning and Fertilizing Have Increased the Yield of a Lemon Orchard 13,685 Picking Boxes in Five Years.

[Written for Pacific Rural Press by Jas. K. Catlin, Carpinteria.]

In July, 1909, I purchased a 20-year-old lemon orchard that had been pruned low so as to pick from the ground. From July to November of that year I picked 2135 picking boxes. That fall I put on 10 pounds of commercial fertilizer to the tree and continued the old style of pruning.

From November, 1909, to November, 1910, I picked 3015 picking boxes. That year I gave the trees another 10 pounds to the tree of nursery fertilizer and started to prove out a system of pruning all my own.

I felt it was a mistake to cut off practically all the new growth every year, so ordered my pruners to leave sucker stubs wherever they had a good footing, remembering the growth from these stubs would be upwards and not to leave them too long.

Unfortunately my pruner did not think much of what I was doing and was not as careful as he should have been in making his cuts. Some were left two feet where they should have been 10 or 12 inches. My plan was to leave stubs each year, in this way, making the cuts so they would develop new fruit wood all the way up in the new growth which I was building.

I found, after each cutting, there would be a number of short spurs of fruit wood thrown out, which would bloom and fruit in one to two years, according to the amount of growth made; and that happened every time that I cut a sucker or good growth back. While they would throw out more suckers or wood growth, there would be one to three or four fruit spurs. I found that by continuing this process, there would be a succession of new tops grown on the tree with fruit spurs and branches all the way up.

As this new top reached bearing age, it would fruit, and the weight of the fruit would bring the branches over, increasing the circumference at the same time I was adding to the height. My plan was to keep this up till I reached a point where it would not be safe or profitable to go higher. As the new branches were brought down by the weight of fruit I would gradually cut out the old limbs that would naturally be smothered out to some extent.

In doing this I tried to go through the orchard each month, cutting off any wild growth I saw, to prevent the trees wasting their energy or growth that would have to be taken off later. In this way I gained a good many months' growth on my orchard in the five years of growing.

As my trees became larger I gave them fertilizer, spring and fall, believing that two applications would be better for the trees than to give them one heavy feed and then let them go hungry for a time.

By this process my yield gradually increased till my yearly picking for 1915 reach 17,000 picking boxes. From now on I plan to thin out my trees and cut back the long drooping limbs, as the sap does not circulate well in these overhanging limbs, and there is a tendency to grow small fruit on that account.

Doesn't Approve of Prune Auctioning.

To the Editor: I do not think that in their discussion of the best way to sell our prunes either of the Colonels are hitting the nail on the head. Col. Weinstock's scheme seems to me to have two weak spots in it: First, he advocates the value of a State brand on our goods. If the prune growers should form a State-wide association to sell our prunes and applied to a New York banker to hire money on them, that banker would ask just three questions, viz.: "Have you those prunes concentrated so that I can ascertain readily whether in amount and standardization they are what you claim? Is your association so organized that I can sue it if you fail to fulfill your agreements? Are the directors and manager of it men of sufficient brains and business experience to carry your scheme to a successful issue?"

If we fail to answer any of these questions to his satisfaction, we couldn't hire a dollar of him at any rate of interest. If we satisfied him on those three points he would never look to see whether our brand read "State of California" or "Kamschatska." A State brand would have no value whatever unless it made the State liable for our conduct of the business.

I don't like Col. Weinstock's plan to sell dried fruit at auction on arrival at point of destination. It is a necessity to sell green fruits, on a large scale, by that method, but there is no valid reason for exposing our dried fruits to such risk. The moment our Prune Association became strong enough to threaten the changing of our present methods of marketing prunes we could count on the united opposition of California packers and the eastern wholesale trade. The former would oppose it for obvious reasons, the latter because the present system, which enables them to acquire our whole crop every year, at their own prices, and puts them under no responsibility to us as to their methods of disposing of it, is the best possible from their standpoint.

Supposing that our organization should ship prunes to New York, Chicago and Boston, to be sold at auction on arrival. What would prevent the secretary of the wholesalers' association from wiring members in those cities not to bid above a certain price? Where would that leave us? We would have to submit to having our prunes slaughtered, or store them and abandon our plan. Why should we, any more than the Walnut Growers' Ass'n, dispose of our goods by auction?

I heartily approve of the Information Bureau plan. It is worth while for itself and would speedily develop into a selling organization.

Napa. Fred K. Smyth.

A meeting of walnut growers was held last week at Tustin, Orange county, to consider the formation of a walnut growers' association. It is said that there are 600 to 700 tons of nuts grown in that district.

Farmers in Coachella Valley have while their new onions and radishes recently been digging sweet potatoes are already on the market.

It is believed that last year's sugar beet crop in Salinas valley may be increased this year, as prospects for a big crop are at present good.

The Fresno Nursery Company, Inc.

Is it your intention to plant nursery stock this season? In placing your order with us, for whatever you may need, you are assured the very highest grade of stock, we having pleased our many customers the past twenty-eight years by giving them RELIABILITY, QUALITY, SERVICE.

We Have a Large Assortment of

APPLES, PEARS, CHERRIES, PLUMS, PRUNES, APRICOTS, PEACHES, ALMONDS, FIGS, WALNUTS AND CITRUS TREES.

Also a nice stock of ORNAMENTALS on which we would be more than pleased to quote you prices.

Catalog and Prices Mailed You on Request.

Spur Pruning Peaches.

[Written for Pacific Rural Press.]

Peach varieties vary in their tendency to set fruit buds close to the base of new growth. On this characteristic depends to considerable extent, the severity of pruning back new growth. F. C. Dyer has 10 acres of several varieties near Ontario in which he has almost devoted his life since he planted the seeds, having budded and planted the trees 21 years ago. Spur-bearing lemon Clings, looking almost as rough as pear trees, occupy 3½ acres. With this variety Mr. Dyer has been exceptionally successful. They bear fruit buds from the very base of the new growth.

Since the trees are so old, not over a few inches of growth are added to the spurs each year beyond the fruits, though two or three feet of last season's growth are being cut out of the tops. This lack of vegetative vigor makes it desirable to shorten back the spurs to not over three fruit buds, since only one fruit is desired per spur and since such winter pruning on such old trees does not induce too vigorous wood growth. This is somewhat true of the down-turning branches of most any variety.

All the fruit wood possible is developed and saved along the main limbs since here it "short circuits" the sap into fruit, while in the upright top limbs, it is more likely to make wood growth. If spurs are too thick, they are thinned out to prevent shading the rest. There were so many spurs on the main limbs this winter that practically all of the new top growth was cut off from the Lemon Clings.

Lovells can be pruned back to spurs almost as short, Muirs a little longer, while Tuscans bear fruit buds only close to the tips which must be left on, or the branches thinned out.

Fruit Tree Supports.

[Written for Pacific Rural Press.]

Use of screw eyelets and wires to make one main limb balance another in the orange trees at the Riverside Experiment Station showed that these eyelets, which are about the diameter of a 10-penny nail, do not pull out under heavy loads or winds, and the wires did not break. The limbs in several cases, however, broke some distance above the eyelets, and in some cases the limbs bent sidewise and broke below the eyelets.

Some rough 1x2 props had also been used on the Navels of this block. These props were all about six feet long, the support for the limbs being a heavy wire bent into the shape of a hook at one end of a 1x2½ rectangle. The rectangular part of the wire was slipped over the 1x2 and hung slanting down toward the hook end so it could be adjusted to any desired height by slipping it up or down.

This heavy navel crop in a year when navels are generally perhaps 25 per cent short, is on the fertilizer experiment plot where cover crops have been continuously used several years.

SPRAYING APPLES AND PEARS.

To the Editor: Is there any spray which will prevent worms in pears and apples? If so, would you please give formula and when to apply it?—F. J. W., Hanford.

[Answered by W. H. Volck, Horticultural Commissioner, Watsonville.]

Worms (codling moth larvae) in pears and apples are readily controlled by spraying with lead arsenate. The chief point to be observed is to make the application early enough to head off the first brood of worms. This involves spraying when the blossoms are falling and before the calyx cups have closed.

Pears should be sprayed at this time and once or twice shortly after; the sprayings two to three weeks apart. In most localities Bordeaux mixture should be used along with the lead arsenate to combat scab.

Formula: Acid lead arsenate 12 pounds, 5-5-50 Bordeaux to make 200 gallons. For apples the scab treatment is not usually required. Formula, first spraying: Acid lead arsenate 12 to 15 pounds, water 200 gallons; second and third sprayings: Neutral lead arsenate 12 pounds, water 200 gallons.

WALNUT TREES WHILE YOU WAIT.

The Ventura Farm Bureau says that a nurseryman of that county offers to use any walnut scions furnished him, to put the grafts into black walnut stock, to care for the resulting trees to the best of his ability and deliver all that grow to the purchaser. He will charge 50 cents for every graft he puts in. If they all grow the cost will be 50c per tree, and if some do not grow the cost will be higher. This for growers who have particularly profitable trees which they desire to multiply for their own planting.

APRICOT FINISHING TRAY.

Mr. R. E. Harrington, of Simi, says the Ventura Farm Bureau, is using a tray 7½ feet long, 3 feet wide and 3 inches deep, with nine-inch handles on the end, into which to scrape the apricots from the field trays. This tray, being longer than the field trays, catches the fruit which might otherwise fall over the ends of the tray to the ground. When the apricots are dried enough to prevent sticking, or curling, they are scraped into one of these large trays and stacked until the fruit is ready to go into storage. One of these large trays will hold the fruit from about ten field trays.

Seed Rice

Wateribune Variety.

If you are in the market for seed rice, buy the best.

Seed which is absolutely free from Water Grass, by official test, is what we have.

Price, $2.25 per 100 lbs. F. O. B. Madison, Yolo County.

Address:

L. D. STEPHENS & SONS, Woodland, Cal.

-hardy citrus trees

Thrifty citrus stock—including Washington navel and Valencia oranges, lemon and grape-fruit. Prime, sturdy, two-year-old budded stock—caliper ¾ inch and up. Straight stems. Trees in perfect condition—grown in exposed positions. Best citrus stock that proper soil conditions and scientific culture can produce.

$2 Combination Offer

Four trees — Washington navel and Valencia oranges, lemon and grape-fruit $2.00. Additional trees 50 cents each. Single trees, 65 cents each. All trees carefully balled—perfect condition for planting. Write to or ask for Mr. Peck.

We have three citrus nurseries—Escondido, Anaheim and Los Angeles. If you are near these points we can save you money by shipping direct from nurseries. Take no chances with inferior trees — get healthy, robust stock. The Germain reputation for highest quality is back of every tree. Special prices on large shipments.

Why Raisin Men Must Keep the Faith.

Continued from page 217,)

why they would work at all. We can see now that it was not so much the relation of the California product to the American importation (though of course increase of product aggravated the situation in all ways) as it was the total lack of preparedness to market the product, fairly to the producer and aggressively to the consumer. It was being handed over to traders whose natural purpose was to make as much profit as they could from every pound of it. It was easier and cheaper for them to lower the grower than it was to lift the consumer, and so it came about that within one or two years instead of five years, after general conceptions and small individual actions; of clear demonstrations of the potency of co-operation, always just out of reach because of the refusal of a minority to co-operate; of absolute proofs of the efficacy of co-operation to secure fair rewards for labor and investment, which such a minority admits that it enjoys and yet to which it will give neither moral nor financial support. This is passing strange—yes, even incomprehensible in connection with the raisin industry, because no special-product region has ever fallen lower by unfair produce trade nor risen higher by capable regulation of such trade by producers, than has Fresno during the last quarter of a century. Every intelligent person knows that there have been times when raisins could not be sold for their equivalent value in hog-feed; when mortgages multiplied as long as any one would finance them; when not only reasonable raisin growers but fruit packers, merchants, bankers, transportation managers—in fact all people, even though some of them had previously made money because growers were unorganized, actually made a drive on kickers, compelling them to sign up, to save the institutions, the homes and the livelihoods of the whole district. It is a matter of common knowledge that whenever growers have come together, raisins have paid a profit, mortgages have been cancelled, old bills have been paid and even the very landscape has taken on a new sun-gleam of prosperity. It is also perfectly known that whenever growers have been torn apart by adverse interests or have fallen apart by their own conceit, envy, greed, visions, vagaries or ungraded foolishness, they have been trampled upon. Thus they always have been since Mr. West's prophecy; thus they always will be—because in the present development and in its need of world conquest there is no trade-power on earth which has the motive, purpose, endurance, money or general capacity to handle the raisin product for its future except such a trade-power as the growers have it within themselves to create and to uphold.

*In these ranges of price the average for standard muscats is close to the lower figures, taking into account the bulk of the sales.

†Contract price paid; not including profits belonging to stockholders and growers.

How an Incomprehensible Fact Wrought the Death of a Man.—We have spoken of the hesitation of raisin-growers to act as one man in support of their livelihood as passing strange—yes, even incomprehensible. And this really seems to be about the only baffling problem in the whole situation, for every decently capable organization of the last twenty years has made raisins profitable and every death of such an organization has reduced their value—as already emphasized—and yet some men do not or will not understand.

This is the tenth year since the death of a man was brought about by this baffling problem. When the whole raisin district sank into such depression and depreciation that practically the whole resident community and the leading outsiders who had activities and investments to rescue, came together to make raisins profitable they succeeded by merging all their hopes and interests in the hands of a masterful man. He was not a popular man; so far as he had personal magnetism it was of the repulsive kind; he had no cordiality nor confidentiality; on the other hand he was clothed in mystery—but he was generally recognized as a man of mastery. He forced and led together most discordant elements. He made raisins profitable and he saved the economic life of the community. His name was M. Theodore Kearney and he wrote his own epitaph. Among his papers, after he died, as he had lived, alone, the following was found:

"When the time comes to write my epitaph, the following might well be copied:

"Warning—Here lies the body of M. Theo. Kearney, a visionary who thought he could teach the average farmer, and particularly raisin growers, some of the rudiments of sound business management. For eight years he worked strenuously at this task, and at the end of that time he was no further ahead than at the beginning. The effort killed him."

We do not desire to enter into a discussion of the reasons why Mr. Kearney accomplished no more than he did nor to approve nor condemn the particular plans and methods which he insisted upon as essential to the permanence of raisin-growers' co-operation. We do not know enough of them to discuss them intelligently. But we do know that he was set upon by self-interest, by distrust and suspicion, by petty envy and imputations of selfishness, and the like—all of which are fatal to the leadership of co-operation and destructive to the very inmost spirit of it. Some people knew they could make more if Kearney's combination were out of the way; other people would rather jump back into the publication of Mr. West's prophecy, the growers found out that about the only way they could get a living from their raisins was to eat them.

A Decade of Efforts at Co-operation.—After the initiative at the Fowler farmers' institute, cited above, there ensued a decade of efforts and experiences which would illustrate and establish all the theses one would need in making a volume on the economics of co-operative selling. Such a thing cannot be attempted in this connection and without such analyses, the record of events would be no more interesting nor instructive than much old-fashioned history usually is and we do not undertake it.

To us the experiences following the first effort of the raisin growers at general organization in 1892 and continuing even to the present day, for they are unhappily not yet quite over, are a dreary sequence of great

Petaluma, Calif.

the slough from which he pulled them than pay the cost of their salvation; others, still, probably thought the shower was over and they could safely duck out and pound in the ribs of the umbrella which had kept them a dry skin. However that may all be this is true, that when the growers did break up Kearney's mastery of the product, or allowed others to do it, they plunged back into the slough of uncertainty and dissatisfaction. They did not, perhaps, go to the bottom as they had before Kearney began, for every strong co-operative effort begets some permanent advantage, and yet they must have been in up to the neck for raisins fell below the price of potatoes and the raisin acreage was being reduced. Frantic efforts almost annually made to regain the old fair price for producers which Kearney secured yielded little until the formation of the California Associated Raisin Company in the spring of 1913.

An Issue Now Pending.—Through such tribulation as had been faintly outlined the California raisin growers came to the realization of an organization much more competent, efficient and aggressive than ever before realized and it has endured three years—each year assuring a profitable price for raisins, each year addressing itself to new problems in handling and distribution and last year, especially, successfully pursuing an aggressive publicity campaign which is working wonders in causing California raisins to be regarded as a food staple by millions who have not previously thought of a raisin except as fruit-confectionery. Thus it has worked for current prices and for future demand to insure profit for a constantly increasing production which its own success has engendered. It has worked by most progressive methods of commercial organization with a proper producers' confidence in the product and with working capital furnished by the producers. It has gained millions for producers in the profitable price of the raisins and it has also made a small operating profit which shows that as a going concern it is proceeding upon a safe basis. It has had to deal with the most acute men in commercial fruit handling and has used their facilities to its general advantage—no matter what may be claimed that it has not made as sharp bargains in certain respects as perhaps it might. It seems to us that even in these respects it has done wonderfully well as an organization of growers in dealing with those whose occupation it has displaced—men deeply entrenched in lifetimes of experience and possessing almost incalculably valuable vested trade rights and resources. It seems to us that discussion of details as to whether this or that factoring item has been as sharply cut as possible should have no place in determining the continuation of the organization as a general co-operation of producers. The great proposition, as we see it, is this, as stated by Mr. Giffen, president of the association:

"The fact remains that three crops, aggregating 300,000 tons of raisins, have been sold under very trying financial conditions and every grower has received 3¼c or more—a record not equaled since the raisin business has become a factor in our industrial life. And this means, to the raisin-growing district, the difference between prosperity and hard times; between a mortgage paid and a mortgage foreclosed."

To enable it to continue such saving work and to make it safe in the face of increased acreage and crop which its own work has made possible, the California Associated Raisin Company insists that a larger acreage by 15,000 acres must be signed up before April 1 in order that it may proceed in the future, as in the past, to work for the profit and security of all the growers. We do not see how any grower, who is free to act on his own convictions and judgment, can refuse to take this first and fundamental action in co-operation which alone can ensure prosperity and maintain land values in his district, as the experience of a quarter of a century has shown. It seems to us that even present advantage, which a few may think they enjoy, should be made a patriotic sacrifice on their part for the general good—justifying their own business consciences, perhaps, by remembering that in the experience of catastrophes, which have been abundant during the last quarter of a century, these particular advantages, which a man may think he has over his fellow-men, are always first to disappear. No man, no matter how wise or strong or self-reliant, can navigate a special-advantage craft in a flood of general disaster!

A Broader View of the Situation.—But earnestly as we are solicitous for the continued prosperity of the raisin growers on the basis of the demonstration of the last three years, and strongly as we would urge them to provide safety first in their affairs, there are other considerations, involved in their present attitude and action, which seem to us so broad and all-pervading in our agriculture that we are prompted to plead with every man of them to throw his property and manhood in support of the co-operative effort which is now dependent upon fuller support. We ask every such man to think the matter over in this way:

First—price-fixing is the goal toward which all agricultural production must press forward. The farm producer is the only producer who does not fix the price of what he

says about Quality--- and Service

Views in the Pear Orchard of Mr. B. M. DENISON, Tehachapi, Calif.

"—my Bartlett pear orchard of 40 acres has made a remarkably fine growth, and excites the admiration of everyone who sees it. Within two years after I had planted my orchard, it had made such a remarkable growth and the trees were so thrifty and free from disease, that it attracted wide-spread attention.

"Although I gave the orchard the best of attention, I do not hesitate to say that your advice concerning pruning and general cultural directions has had much to do with the uniform, shapely appearance which the trees present today. Experts have pronounced these pears perfect in appearance and exceeding in quality anything which they have ever received from any other section of the country."

No Matter What You Need in Nursery Stock---

We can supply you with splendid specimens of almost every variety. Our stock of Bartlett Pear trees is the finest we have ever grown. They are good and stocky, California grown, have a splendid root system, and we can supply them in almost any quantity you desire. We also have a fine stock of **Peaches, Walnuts, Oranges, Olives, etc.**

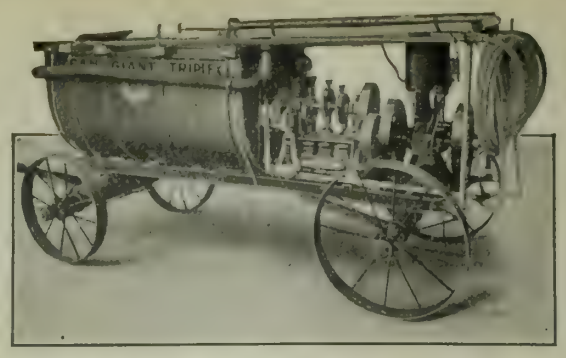
sells, on the base of cost of production and fair reward for his capital and labor. Even such primitive and crude food production as hunting and fishing names the value of its output—but agriculture does not. Even manufacture, based upon farm products, names it price, but farm manufacture does not. The canner puts a ton of peaches in cans and issues his price list: the grower puts a ton of dried peaches in sacks, and says: "What will you pay for them?" This is the traditional attitude of the farmer and he alone can demonstrate his title to more rational industrial standing.

Second—price-fixing can only be successfully achieved, now, by producers who have a special line of production which by limited geographical area and joint action of producers, measurably known to each other, can be controlled. Price-fixing is the ripe fruit of co-operation, which has withstood winds of false doctrine, storms of adversity induced by opposing interests, fierce heat of impeachment and temptation and it comes to full maturity because the twig which bears it is closely and inseparably knit to the deep-rooted tree which has nourished it. Price-fixing is only wise and safe when there is adequate solidarity in the interested group of producers. Effort in this direction must be postponed until such solidarity is attained. The walnut growers have this, the almond growers have this and they have distinctive products achieved practically within the geography of the State and they are profiting splendidly by these advantages which sustain price-fixing effort. The raisin growers' price-fixing control is the greatest fruit of all our co-operating experience and it has demonstrated its reasonableness by its distinguished success after a quarter of a century of evolutionary struggle. If this achievement is made vain by the refusal of a small minority to sustain it and to gather its fruit for themselves and for the State, it will be an agricultural calamity.

Third—price-fixing, the control of which warrants it and the special distinctive product which makes both now possible, are three advantages which can only be made permanent by continuously increasing effort. Special food products are at enmity with staple food products and are engaged in a war of displacement against them. Every pound of specially good distinctive food, such as California nuts and cured fruits, either displaces a pound (more or less) of staple bread, butchers' meat, potatoes, beans and the like, or else adds itself to them and causes the consuming masses to be better fed at an increased cost of living. In either case it is a warfare—against the staple, against the family purse, against the family bank account, or against the family extravagance or waste in other expenditures. This war has to be waged by demonstration of delight and wholesomeness, by suggestion of fashionableness, etc., and achievement of popularity—the 17-inch gun of which is publicity and the munitions the money of the primary producers. No buyer, broker, consignee nor any other trade institution or agency can undertake the cost of such publicity, as a special food product needs to best a staple so that it may live with it or displace it. None of the popular breakfast foods would ever have displaced old-fashioned oatmeal and cracked wheat if it had waited for publicity provided by commercial handlers—that was achieved by the money of the manufacturers. It is just the same with the distinctive food products which California is pressing upon world consumption and in the production of which California has either notable advantage or practical monopoly on this continent. Therefore both price-fixing and control of product, which is essential to it, can never profit most nor, perhaps, even maintain themselves in action, unless the progressively increasing production which they engender is supported by effective publicity planned and provided for by co-operation of producers.



Fourth—For this reason we see in the continued and increasing work of our greatest price-fixing and control organization, the California Associated Raisin Company, not alone the assurance of prosperity and growth to the raisin industry but the foundation upon which the future of all our distinctive products can alone be made profitable and capacious. As we see it, they must all follow in the lines occupied by the raisin growers in their ultimate capitalization, control, distribution and promotion. And of course, as they finally attain to this position of importance, dignity and self-respect, it will be proportionally better for commerce, transportation and all other serving interests and institutions. These special products must be made great and commanding and that can alone be done by co-operating producers.

A Last Word of Appeal.—As this vision of the significance of the coming April clearly confronts us, we are disposed to plead with every man, who thinks he knows a better way to do a thing desirable to be done, to achieve his honorable purpose by his influence within the association and not fritter away his powers by neglect or opposition to it. Even if he should succeed in opposition he would perish in the downfall as did Samson, when he bowed himself with all his might against the pillars of Dagon's temple. And such a man would be denied even the satisfaction of Samson, for he slew more of his enemies at his death than he had slain in all the previous life of him. If a man could pull down the pillars of the beneficent structure raised by the raisin growers he would perish with more of his friends than he could destroy in any other way; he would devastate his community; he would impede the development of his State.

A report from Colusa states that if the weather permits there will be over 18,000 acres planted to rice in that district this spring.

The "BEAN" for Results

A spraying outfit may have all the other virtues you might possibly think of—but if it doesn't drive the spray material onto the trees at heavy pressure, and if it doesn't keep up uniform work—it's a failure, and your time and money are largely wasted. The BEAN gets results. The sturdy Novo Engine and the Matchless Bean Pump drive the material on at tremendous pressure—so that it reaches every crack and crevice—and does the work thoroughly and completely. You should become familiar with the

10 Big Distinctive Features

This is the Bean Magic, the only hand pump that can be continuously operated at 120 lbs. pressure by one man without exhaustion. Porcelain-lined Cylinders, Ball Valves, and Bean Quality all the way through.

that gives the Bean its prominence. You should know about Bean Porcelain-lined Cylinders, the Bean Pressure Regulator, the Pump without a Stuffing Box, Bean Underneath Suction, the Bean Re-filler, Bean Eccentrics, the Bean Rocking Bolster, Bean Direct-connected Engine and Pump, Bean Interchangeable Parts, and

Bean Threadless Ball Valves

—the valves that cut sprayer troubles in half. Simply bell metal balls revolving on reversible and interchangeable brass seats. No threads to rust, corrode, or stick tight. Can be opened up entirely in less than 2 minutes without lowering the pressure, without stopping the engine, without drawing the liquid from the pump.

Placer County Horticultural Notes.

To the Editor: On account of the prices secured for the Diamond plum, this variety is figuring largely in new plantings and in grafting in Placer county this year. Judging by the results of grafting the Diamond in this county, peach stock is not at all satisfactory. They grow very well for a few years but develop a big lumpy union with a deep crack in the bark completely around it and, in many places dying rapidly after five or six years.

A very few plantings are on myrobolan which seem to be satisfactory on the lower or heavier soils. I have heard a little complaint about the myrobolan suckering, but believe the roots in these cases were not true myrobolan.

I have found a few young trees on almond on high land and these have a fine looking union. Also have found a few on apricot which were about five years old and had fine unions. Apparently the apricot root will do well in the drier soils but the gopher must be considered, as this pest is fond of the roots.

The Placer county orchardists would be glad to hear from "Pacific Rural Press" readers who have had experience with the Diamond on various rootstocks.

Edw. O. Amundsen,
Placer County Farm Adviser.

MORE ABOUT STANDARD PRUNES.

To the Editor: In Contra Costa county the Standard prune seems to be a flat failure. Some years ago one of the best orchardists of the county who has always grown a high grade of French prune, grafted in some Standard prunes. Last season he gave personal attention to drying them, picking at different stages of maturity, dipping some slightly and others heavily.

When he sold his French prunes he called the attention of the buyer to several boxes of dried Standards. He looked at them and remarked, "Don't want them at any price. They are just skin and bones."

While the fruit is attractive before drying, and may make a good shipping prune similar to Tragedy (providing there is a market for prunes in September when Standard prunes are ripe), when dried it is a conundrum—a joke.

It is a pity that new fruits should be so advertised and exploited before even preliminary tests are made. Many trees in the county will have to be re-grafted at considerable loss.

I would advise J. A., of Morgan Hill, to plant trees of selected French prunes and stick to things that have been demonstrated a success.

Frank Swett,
County Horticultural Commissioner.
Martinez, Contra Costa County.

SUDAN GRASS.

To the Editor: I have just read in this issue about the Sudan grass. Where can the seed be gotten and how much to sow to the acre? Would it be best to drill this in? If this is put in with a poor stand of alfalfa would it have to be irrigated?—H. D., Woodland.

[Several of our advertisers are offering Sudan grass seed. Write to them. That is what advertisers are for. Sudan grass can be drilled in in 30-inch rows and culivated till it gets a good height; that is the way to get the most growth from the least water. On your poor alfalfa you will have to broadcast and scratch in the seed. Probably you need not irrigate to get considerable growth on good valley land, but you will get more grass with more water. —Eds.]

GRAFTING ON ZINFANDEL.

To the Editor: I have ten acres of Zinfandel wine grapes which I wish to graft to Thompson Seedless, but I have been told that seedless on that root will not bear well. What do you know about it?—E. P. Kingsburg.

[Answered by Prof. Bioletti.]

[Sultanina (Thompson Seedless) grapes will succeed very well when grafted on Zinfandel roots, if the grafting is done properly. The method is described in Experiment Station Circular 115, a copy of which will be sent to any applicant. As the Zinfandel is a much weaker grower than the Sultanina, it is necessary to do the grafting deep in the ground, so that the Sultanina scion can make its own roots.]

A Farmer's View of Rural Credits.

To the Editor: I have been reading the articles in your paper about rural credits and would like to advance a few ideas of mine in regard to that much-discussed matter, if you have space for them.

I am 57 years old and have been on a farm all of my life here in California, and with ordinary intelligence I should know something about the conditions that confront the California farmer.

The majority of farmers here are paying interest on mortgages and I think that most people agree with me that the interest is too high, so what are you going to do about it?

It does not help the farmer any to sneer about paternalism and remind him that he is too intelligent and too capable of attending to his own business to need any help from the government.

Right here in my neighborhood are two farmers; industrious, honest and sober, who bought 20-acre tracts a few years ago, made a small payment and tried to work out their homes and who have given up their places and moved out to go to work for wages. Why? Too high interest and too short a time for the mortgage to run. There is no security on earth that is as good as personal real estate. And if these same farmers could have gotten loans at four per cent to run for 10 years, they could have both made good instead of going to join the unemployed.

Speaking of paternalism, I wonder how many people ever stop to think about the example of paternalism that we have in all our towns, even the small ones, in the shape of our national banks, who deposit interest bearing bonds with the U. S. Treasury and draw down 90 per cent of national bank notes which they can loan to the farmer at as high a rate of interest as they can get.

But when the farmer proposes that the government loan money to him on good security at a reasonable rate of interest and on long enough time to give his orchard or vineyard a chance to get into bearing some of his would-be friends start to run around in a circle and shout "paternalism."

I believe in the principle of the greatest good to the greatest number, and it is impossible to help the farmer without helping the merchant, lawyer, doctor, dentist and all others. Also anything that tends to keep the farmer down has a corresponding bad effect on the business men of the town.

I recollect in some of the years gone by, when it looked as if we would not have enough rain to make crops; let there come a good night rain and then go to town the next day and the merchant would be smiles all over. It was not because he had anything to be benefited by the rain, but because the farmer had.

There is hardly a farmer but what could borrow money at four per cent on long term, say one or two thousand dollars, and put it into improvements and make money on it. And that money would go into circulation and help everybody, from the working man up. But if he has to pay eight per cent he is afraid to tackle it.

It is not a case of helping the unwise against his folly, but of loaning money on the best kind of security and helping all of the people of the State by doing it.

This is not intended as a knock against any person's views on this subject, because I respect every man's honest opinion, but it is the way it looks to me after a lifetime experience on a farm.

Reedley. Frank McClellan.

STATE LIBRARY FOR ALL THE PEOPLE.

[Written for Pacific Rural Press by J. L. Gillis, State Librarian.]

The State Library in California occupies a place in the educational development in this State unique in the history of education and of libraries. For many years it has had three distinct purposes.

1. Procuring and making immediately available all books and other library material needed by the legislature and by the State officials.

2. Making the same material available to every resident of California when not in use by the legislature and by State officials.

3. Working out a library plan for the State under which every resident of the State will have equal, economical and complete library service.

In the California State Library the procuring of library material is in the hands of assistants especially trained for the work. Every department in the State's government is kept in mind so that it may be supplied with the latest material on its subject.

Careful attention is given to everything on California history. The indexes to California newspapers and other material are in constant use, and if those people of the State who have donated manuscripts, books, music and pictures could see how often those very things fill gaps in historical records and help the historian and other inquirer, their pleasure in making those gifts to the people would be complete.

The use of documents of all kinds —foreign, United States and State— is become more and more popular means of securing authentic information. For this reason, especial attention is given to completing all sets in this department and in ob-

Fertilizer Quality

When you buy fertilizer remember you are buying what is *in* the goods and not merely a weight of two thousand pounds.

When a smelter buys gold ore he buys not merely two thousand pounds but he insists on knowing how much gold is in the ore, and you should know the amount of active nitrogen, which is the gold of the fertilizer.

GET RID OF DESTRUCTIVE GOPHERS BY USING EFFICIENT TRAPS.
E. J. Chubbuck Co., Gentlemen: The gopher trap you mailed us Jan 22d has proven a success according to one of the ranchers. He claims to have set it seven times and caught seven gophers. It is impossible for a trap to do more. *** Express three dozen Ideal Traps at once as this is the best time to trap this pest. Expect our next order will be for one gross.—E. P. S. Co., El Paso, Texas, February 2d, 1916.

The trap guaranteed to catch small or large pocket gopher. Being round with thin edges, gopher walks into trap before detecting anything in runway. 100 per cent efficient—catches gopher every time. Far safer and surer than poisons or gas. Farmers say it's worth dozen other makes. PRICE 50c. If your dealer can't supply you, will be sent postpaid; two traps, 95c; six traps, $2.70; twelve traps, $5.10. Money back if not satisfied.

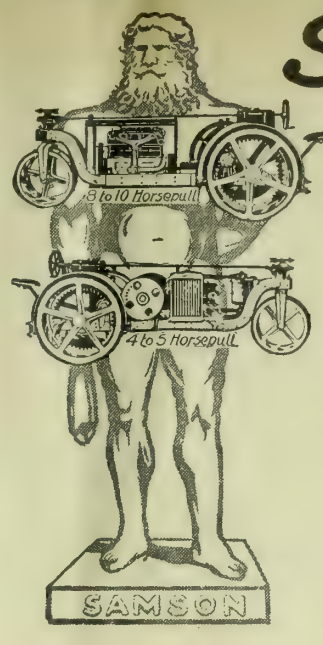
taining all indices and other aids to the use of the documentary material.

The California State Library has further facilitated its work by adopting the method of making photographic reproductions and loaning what is called a "cameragraph," that being the name of the machine used. This is a quick and cheap process by which the picture of the page is reproduced on sensitized paper, and after being dried can be loaned to the inquirer. This avoids duplicates except when actually needed, means less expense for transportation, saves the original copy from the wear and tear of shipping and keeps it on the shelves for use in any way at any time. The California State Library was the first library to adopt this photographic method and other libraries in the country have recently begun using the method, among them the Library of Congress at Washington, D. C.

The building up of its general reference collection is being carried on rapidly. Books on every known and used subject are purchased, such as history, literature, science, art, books for the blind, medicine, law, books in foreign languages, agriculture, sociology—everything to help the library do its part in the plan of equal, economical and complete library service to the people of the State.

In addition, then, to its first purpose, namely, a library service to State officials,—in order to carry out its second purpose, namely to make itself also available to all the people of the State,—the State Library had to apply itself to working out a plan of adequate library service for the State. The answer has been found in the county free library plan, which has already been adopted by 33 counties in California, and even the most conservative predict will in a few years more cover the entire State.



The county free library plan has recently been fully explained to Pacific Rural Press readers. It is a library for all the people of the county, established by the supervisors and is in charge of a trained, exeprienced county librarian. It has branches in every part of the county, and every other library interest in the county may co-operate with it.

The county unit is large enough to raise sufficient funds to support a library by means of a small tax. The small town with a free public library and necessarily with small local financial support, may join the county free library, and in that way furnish the supplemental library service needed by the residents of the town; the county teachers' library and county law library may join the county free library, as may also the school districts, elementary and high, by turning over their funds to the management of the county free library. This unifying county institution then receives not only free supplemental library service from the State Library, but this service free of transportation charges also.

This unifying of library service in the county unit creates such a big saving that the library resources of the county very soon double. With branches in every community—all supported by the county free library—the distribution of library service soon becomes equal and complete. The working out of every detail for economy has been a matter of great admiration on the part of those who have made a careful study of the California library service.

And it has been other States and counties that have marveled at the California library plan. Californians themselves hardly seem to realize what a wonderful system for distribution of books and information has been developed for their use. The credit is due to the California State Library—an institution that is busy every moment working to perfect this unique and successful plan for the education of the people. The Sutro heirs recognized the great work of the State Library when they presented to it the valuable Sutro Library, and almost daily some gift is made, for the people feel that the State Library is theirs and for them perhaps more than any other institution in the State.

An application has been made by a board of trustees of ranchers in Madera and Merced counties for the establishment of a water district that includes 400,000 acres of land in the two counties mentioned. A survey is now under way for the district which contemplates the construction of a large dam for storage purposes and extensive canal systems which will cost $4,000,000 to $5,000,000.

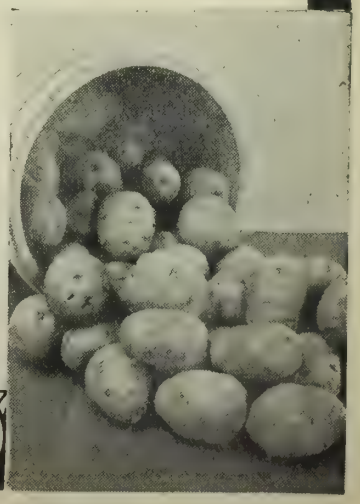
SEED CATALOG
Now Ready.

It is free—mailed on request. It tells how and when to plant—garden, flower and field seeds.



Alfalfa Seed

This illustration is a reproduction of alfalfa seed as taken from sacks in our warehouse. You will note that the seed is plump and free of weeds. We believe we ave the finest stock of alfalfa seed ever gathered together in California. Our **Surprise Valley Seed,** which we consider our best, is absolutely **free of dodder** and all other weed seed, This seed was raised in the extreme Northeast corner of the State—Modoc County—and will produce a hardier and heavier crop than seed raised in a warmer climate. Samples and prices on request.

Seed Potatoes

We now have a fine, true to name, healthy stock of American Wonder, Early Rose and Garnet Chili Potatoes. These are all good, early, standard varieties suitable to California conditions.

Write for prices.

Pull Stumps Now.

[Written for Pacific Rural Press.]

Those having fields containing stumps, which have been plowed around in years gone by, should take advantage of the present condition of the ground and get them out before another season has passed, as increased yields from such land make stump pulling profitable. With the ground moist, as at present, the roots come out cleanly and easily, a factor which has much to do with the cost of clearing land.

As an indication of the progress which has been made by manufacturers in stump pullers, it is interesting to note the record of C. A. Hines, of Washington, who, though crippled by the loss of one arm, has pulled and piled, ready for burning, two and a half acres of big tap-rooted fir stumps in 24 working days. As this was done with a hand power puller and without the use of power, other than his one arm, it seems pretty well demonstrated that modern day stump pulling is not the difficult task it was a few years ago; also, that there is much stump land, now practically worthless for field crops, that can be put in condition to yield good crops with but a slight first cost for clearing.

C. A. Hines at Work with His Stump Puller.

HOW TO IRRIGATE BEETS.

To the Editor: I have 100 acres to irrigate, and about 800 gallons of water per minute. Some of the land, one-half mile from the well, is said to take up water very readily. Most of the land goes into sugar beets. The land has a gentle slope from the well and the water has to be raised 95 feet. I want to know the best and most economical way of getting this water over the land.—Z. T., Sunnyvale.

[Answered by Prof. S. H. Beckett, University Farm, Davis.]

[You will find the methods of preparing, seeding, irrigation, etc., completely described in Farmers' Bulletin No. 392 on the Irrigation of Sugar Beets.

With the conditions you describe, that is, a light sandy soil with a gentle slope, it is probable that the furrow system of irrigation may best be applied, the length of the furrow being in the neighborhood of 330 feet. In this case your field would have to be crossed by a series of parallel delivery ditches spaced 330 feet apart. With a light sandy soil you will probably have difficulty in getting a full discharge of 800 g.p.m. through the open ditch without losing a large per cent through seepage. It is probably advisable for you to use either an open timber flume or galvanized iron slip joint pipe in carrying the water from the well to the distant fields. If the land between the wells and the field to be irrigated has considerable grade an 8-inch diameter pipe will suffice. If, however, the grade is very flat the size of the pipe would have to be increased to at least 10 inches in diameter.]

RULE FOR MEASURING WATER.

To the Editor: Please give me the rule for measuring a stream of water. —W. H. P., Pozo.

[Answered by Prof. S. H. Beckett, University Farm, Davis.]

[The most satisfactory method of measuring a stream of water such as you describe is by the use of the Cippoletti weir. A bulletin in which the method of installation of the weir and the method of making the measurement is completely described may be obtained from the Director of the College of Agriculture at Berkeley. In this bulletin you will find that the measurements are given in cubic feet per second. If it is found desirable to reduce this to customary miner's inches simply multiply the number of feet per second by 50. If on the other hand it is desired to obtain the measurement in gallons per minute, multiply the cubic feet per second obtained in the weir measurement by 450; 450 gallons per minute being equal to one cubic foot per second.]

WHY QUAIL SURVIVE SQUIRREL POISON.

The experiments of the California Fish and Game Commission show that poisoned barley as used for ground squirrel eradication does not cause death of California Valley quail under natural feeding conditions. They may be fed under natural conditions relatively large amounts of strychnine sulphate without showing toxic symptoms. The minimum killing dose by subcutaneous injection is four milligrams per 100 grams of body weight.

The California ground squirrel is very susceptible to strychnine sulphate; one-tenth of a milligram per 100 grams of body weight produced convulsions.

R. D. Robertson is planting 20 acres of almonds on his ranch near the Buttes in Yuba county.

Market Aspect of Tepary Beans.

To the Editor: In your issue of February 5 I note an answer to an inquiry in which you state that teparies are being sold in California at one cent a pound less than the small whites. Would you be so kind as to give me the names of those who are handling the tepary beans. Ever since the introduction of the tepary bean in Arizona by Professor Freeman of the U. of A. Agricultural Experiment Station, our main difficulty has been the market question. We have been giving this matter considerable publicity for the last two years, and feel that we are now at the point where this bean should be standardized on the market on a par with other beans. The fact that this bean has a very high food value and will produce a large yield with less moisture than is necessary for other beans makes it extremely valuable for many sections of California and Arizona. In an effort to standardize the marketing of this bean and secure for it a regular place on our bean markets, we are endeavoring to get all the information possible. Any information, therefore, that you can give me on this subject will help not only growers in Arizona but those in California. **Stanley F. Morse,**

State Leader, Extension Service, University of Arizona.

Tucson, Arizona.

[We are not aware that anything systematic has yet been done for teparies and discussion of selling experiences would be very interesting. —Eds.]

MORE WORK IN A SIX- THAN A SEVEN-DAY WEEK.

To the Editor: A year ago my brother picked prunes thirteen successive days. The first day, Monday, he picked fourteen boxes, and less each succeeding day to the second Saturday. The second Sunday he rested. Monday he picked as much as the first day, and in the first three days of the third week he had picked as much as in the first four days of the second week, that is, the seventh, eighth, ninth and tenth days which he had worked without a rest. I would be interested to know if some of your readers have any facts and figures to show that men can do more work in six-day weeks than in seven-day weeks, and would like to use in my school work any information which might come through your paper. **Harry F. Stone.**

Berkeley, 2327 Bancroft Way.

[Who has figures from actual records on this point from any kind of farm work?—Eds.]

A SUGGESTION ABOUT LIME.

It is very interesting to learn of the great benefits being realized from the use of lime in our California soils.

The idea has prevailed for many years that our soils did not require the addition of this element, that they were well supplied with it. This idea is being rapidly changed by the results from proper use of lime in some form—"The proof of the pudding is in the eating."

The beneficial use of lime has been fully demonstrated in most sections of the State, especially so in the citrus sections, the orchard, alfalfa and delta districts.

Many soils are rich in plant food, if it be put in available form as lime will do. Many soils require lime element that has been leached or farmed out of them.

The labor saving alone often pays for lime used on heavy clay and adobe soils—to loosen them, to say nothing of the greatly increased crop.

The table grape man reports that his yield is heavier, the berries better colored and more firm—the peach and prune man says his trees make better growth, produce more and better quality of fruit. In many cases the orange grower reports curing his trees of yellow leaf. There is no question as to getting better value out of fertilizers where lime is properly used.

It is astonishing the interest being shown and good being realized by use of lime among fruit growers of Placer, Napa and Sonoma county districts; also the alfalfa and fruit men of the San Joaquin Valley sections.

The ground limestone and agricultural hydrated limes are now being sold at prices that are readily within reach of the farmer and fruit grower, and if his soil is in need of lime, he cannot afford to not use it. If he cannot put on at one time all of the lime his place requires, lime part of it, make a beginning: learn what lime will do for you as soon as possible. If it will give you a better crop and soil conditions, the sooner you get at it the better.

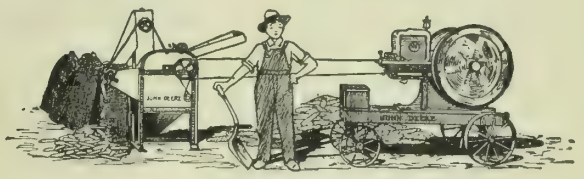
Nursery exports as well as imports from Fresno county fell off 50 per cent during January as compared with the month of January, 1915, as a result of the heavy rains all over the State. There are 75 nurseries registered in Fresno county this year.

John Deere Plows for Light Tractors
For Orchard and Vineyard

Practical—work with any standard tractor. One-man outfits—controlled by man on the tractor.

No levers—one reason why these plows work so successfully. Plows leveled and depth regulated by screw device. Can be run close to trees and vines without injuring branches.

High and Level Lift—Pull the rope and all bottoms raise high and level. Another pull lets them down.



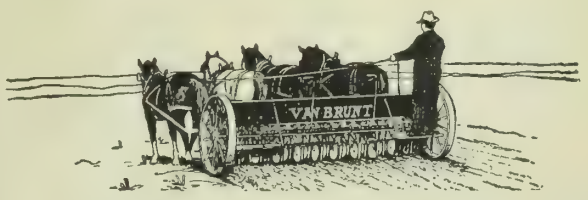
Plows raised in fourteen inches ground travel. Make square headlands.

All bottoms raise high like a double bail, high lift horse plow. You know from experience what this means. Plows do not clog or gather trash on the turn.

Extra wide and semi-floating front truck.

Equipped with either three or four famous John Deere 12-inch bottoms with Quick Detachable Shares—the shares that can be taken off and put on in one-fifth the time it takes to change bolted shares.

Write us for free booklets telling all about John Deere Light Tractor Plows for orchard and vineyard work, or Light Tractor Plows for regular field work—the plows with Quick Detachable Shares, high and level lift.



R. & V. Engines
Dependable Farm Power

"R & V" Triumph—always develops rated horse power—made in 1, 1½, 2½, 4, 6, 8,10, 12, 16 and 20 H. P. sizes, stationary and portable.

Easily started; perfect speed control (speed can be varied 40 per cent without stopping engine). Complies with insurance regulations. Hopper cooled—a simple, efficient system that does not require long pipes and numerous fittings.

High grade throughout. Inspect the extra guard ring over piston pin to prevent possibility of scoring cylinder. Ask about the "R & V" oscillating magneto. Write for free booklet.

Van Brunt Drills
With Adjustable Gate Force Feed

THEY plant any small seed, alfalfa to bearded oats, peas or beans. Quantity per acre easily regulated merely by shifting feed gauge levers.

All the ground planted without wasting seed. The Van Brunt adjustable gate force feed and special agitator in the hopper compel seed to leave hopper in even, continuous streams.

An even stand of grain is certain. Pressure springs compel discs to make furrows of equal depth and seed is protected until it reaches bottom of furrow. Single or double discs. Write for free booklets.

John Deere Disc Plows for Tractors
For Field or Orchard

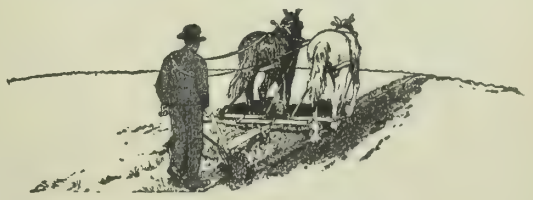
MADE especially for use in the West. Work successfully in every soil where a disc plow should be used.

Plow anywhere from five to twelve inches deep.

One-man outfits—controlled by man on the tractor. Work with any standard tractor.

Can be used either for field or orchard work simply by changing the land axle.

All levers down close to plow when at work—plow can be operated close to trees and under limbs without injuring them.



Easily transported—special lever at the rear for lifting discs high and level.

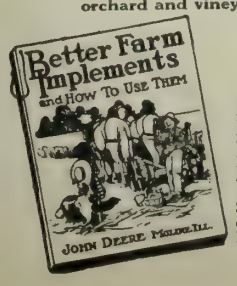
Over fifteen inches clearance under beam; twenty inches between discs.

Twenty-four or twenty-six-inch discs with chilled metal bearings—constructed so that bearings do not drag along wall of furrow when plowing deep.

Can be reduced to four discs by taking off one intermediate section and telescoping connecting rods.

Write for free booklets describing the John Deere Tractor Disc Plow No. 10 for field work and No. 11 for orchard and vineyard.

John Deere Syracuse Plows
The Plows with Perfect Fitting Parts



SYRACUSE chilled shares fit perfectly—extra shares go on easily. Share draws up snugly to its place—a smooth joint formed always.

Syracuse 601 Series, wood beam, sloping landside plows are superior for general purpose work in light soils—the 16 Series, wood beam, with side shifting clevis, for hillside work.

Syracuse J-gang plows, three bottoms, are especially satisfactory for vineyard and orchard work.

Write for free booklets. Also ask about Syracuse non-cloggable spring tooth harrows.

John Deere Dealers Everywhere

Better Farm Implements and How to Use Them

BOOK FREE—168 page reference book—tells all about a complete line of farm implements and how to adjust and use many of them. A practical encyclopedia of farm implements. Worth dollars. Describes and illustrates: Plows for Light Tractors; Steel and Chilled Walking and Riding Plows; Disc Plows; Cultivators; Spring Tooth and Spike Tooth Harrows; Lister Plows and Cultivators; Disc Harrows; Alfalfa and Beet Tools; Farm and Mountain Wagons; Teaming Gears; Manure Spreaders; Inside Cup and Portable Grain Elevators; Corn Shellers; Hay Loaders, Stackers, Sweep Rakes, Mowers, Self-Dump Sulky and Side Delivery Rakes; Hay Presses; Kaffir Headers; Grain Drills and Seeders; Grain Binders; Corn Binders; Gasoline Engines. This book sent free to every one who states what special implements he is interested in and asks for Package No. X-152.

John Deere, Moline, Illinois

General Agricultural Review.

DECIDUOUS FRUITS AND NUTS.

A dispatch from Capay valley says that the prospects for a good almond crop in that section are excellent at this time.

J. W. Hayes has purchased 12 acres of land near Windsor, Sonoma county, which he will plant to prunes this spring.

A tract of 135 acres near Stoney Creek, Glenn county, will be planted to almonds and alfalfa this year by Sacramento and Orland men.

The Garden Grove Walnut Growers' Ass'n has finished work on the 1915 crop, having sold 347,900 pounds of nuts the past season.

Nevada county pears will be known as "Blushing Bartletts" hereafter, the idea being to build a reputation for Nevada county pears similar to the Sunkist brand of oranges.

Careless methods by those owning apple trees in the city of Watsonville is said to be spreading disease among many of the orchards of that vicinity.

There are some 40,000 acres of deciduous fruits, bearing and non-bearing, in San Bernardino county, according to Horticultural Commissioner J. P. Coy.

Growers of deciduous fruits in the vicinity of Corona are agitating the erection of a co-operative cannery. It is not expected that the plant will be ready to handle this year's crop.

All of the Southern California locals of the Cal. Cured Fruit Exchange have withdrawn from the State organization according to Hugh Knight, Sec'y of the Lake Elsinore Cured Fruit Association.

At the annual meeting of the Sebastopol Apple Growers' Union last week it was decided to enlarge the packing house at Graton. All members of the board of directors who served last year were re-elected.

The success that has been attained by the California State Walnut Growers' Ass'n during the past few years is directly attributable to standardization, according to H. Zander, traveling representative of the association.

According to Horticultural Commissioner L. H. Day, there will be more than 1,000 acres of fruit planted in San Benito county this season. To date 25,760 prune trees, 12,625 pears and 12,175 apricot trees have been inspected.

According to advices from Oakdale, orders for the 1916 crop of almonds are already being received by the local branch of the California Almond Growers' Ass'n, although the price for the 1916 crop has not as yet been fixed.

The following shipments of fruit trees were received in Butte county during January, according to Horticultural Commissioner Earle Mills: Almond, 16,962; pear, 7,196; prune, 5,320; peach, 2,015; orange, 1,400; grape vines, 743; apple, 653; cherry, 102.

The general prosperity throughout the east, together with a lower rate on California fruit shipments to southern States, will make the coming year a prosperous one for fruit shippers, according to H. W. Adams of the California Fruit Distributors, who has just returned from a trip through eastern states.

CITRUS FRUITS.

The Pomona Fruit Growers' Exchange recently packed part of a car of lemons for shipment to Honolulu.

The six packing houses in the Pomona district have been shipping 20 to 25 carloads of oranges weekly recently.

Six carloads of oranges were shipped from the Orland project this year, which is the largest amount shipped from that section to date.

An average of nearly 40 cars of oranges and lemons were shipped from Riverside last week and the 1,000 mark for the season will soon be passed.

There is $250,000 invested in pre-cooling plants by members of the San Antonio District Fruit Growers' Exchange according to its manager, P. J. Dreher.

A $75,000 plant to furnish condensed ammonia for pre-cooling oranges as well as for ice making, is nearly finished at Redlands by the Union Ice Co.

A citrus grower marketing outside the Exchange is like a boy on a bicycle who hangs onto an automobile, says Wm. Bristol of Highlands. He gets there just as soon.

The Indian Hill Citrus Ass'n of North Pomona started testing ammonia pipes and machinery Feb. 11 for their newly completed pre-cooling plant, according to Manager F. W. Knight.

Individual tree records of production are being kept on 40,000 trees belonging to J. S. Edwards near East Highlands, according to his orchard manager, J. C. Perry. This is the second season's records.

N. Wilson of Ontario shows records of having cleared nearly $14 per day for the week ending Feb. 5, after all feed and expense bills were paid, by marketing the eggs of 850 Leghorn hens kept in his orange orchard.

Some 15 citrus orchards in the Upland-Ontario district are co-operating with the Riverside Experiment Station under supervision of Professor Vail in keeping cost accounts and furnishing complete details of orchard management.

"I haven't cultivated my orange orchard in three years, and won't if I can avoid it," says R. S. Thompson, manager of the Highlands Exchange Ass'n. He uses limestone, summer and winter cover crops, and commercial fertilizers, but no manure. His fruit is about the best in the valley.

P&O

Sunset Vineyard Plow

The P&O No. 4 Sunset Vineyard Gang Plow is a small three bottom plow adapted particularly to use in orchards and vineyards. It has a narrow wheel tread and the levers are arranged so that they do not interfere with the overhanging vines or branches. It's the Way We Build Them.

High carbon steel beams with ample clearance in throat, and rigidly braced to each other. Wide lateral and vertical range of hitch adjustment. 18-inch wheels with 3-inch tires, dust-proof boxes and large hub grease cups. One lever raises and lowers plow and the other regulates depth. A heavy spring assists in raising and lowering bottoms. When the plows are in the ground the levers lay down close to the beams out of the way. A steel handle is attached to rear beam for lifting rear end of plow. Bottoms are 8-inch with soft center steel mold, and steel or cast share. One extra share is furnished. Also a 3-horse steel evener.

P&O Light Draft Plows Are Backed By An Unqualified Guarantee

Beet Cultivator (K)

KILLEFER QUALITY

KILLEFER EFFICIENCY

The frame of this Cultivator is made of one continuous piece of high carbon steel with a truss connecting it to the main castings, supporting the two steering wheels. This construction makes a cultivator that is almost impossible to break down in the center and in consequence the wheels are always in line and under easy control.

The lower frame or tooth bar is from the same quality of steel with a strong arm at each end, which connects with the lifting rod, allowing no chance for the frame to dip or run deeper at the ends. The seat is set back far enough to give an unobstructed view of the rows. The foot control of the front wheel that holds it rigidly in line except on the turns. This is very easy on the operator. A lock is provided for the rear wheels that holds it rigidly in line except on the turns. This is the **strongest** and **best made** Beet Cultivator for sale on the Pacific Coast.

WON HIGHEST AWARD AT SAN FRANCISCO EXPOSITION

International Harvester Wagons—Weber—Columbus

THERE are a few points about the new **Columbus** and **Weber** wagons that every farmer ought to know. These points make the difference between **Columbus** and **Weber** wagons and others—a difference that means a good deal to you.

The fifth wheel, that prevents the pulling up and pitching of the bolster, makes it easier for your team to pull a **Columbus** or **Weber** wagon and does away with bent and broken king pins and circle irons. The patent folding endgate and the link end rods save much of your time in the busy season. The high-grade wood, iron, steel and paint used add years to the life of **Columbus** and **Weber** wagons. These things mean economy.

These points are explained in detail in our wagon folders and are pictured so plainly that it's almost like looking at the wagon itself. Some dealer near you handles these wagons and has samples set up for you to see. Drop us a line and we'll send you the booklets and folders. We'll also tell you where you can see a **Columbus** or **Weber** wagon so you won't have to waste any time looking for it. Write to us today.

International Harvester Company of America

(INCORPORATED)

Crawford, Neb. Denver, Col. Helena, Mont. Portland, Ore. San Francisco, Cal. Spokane, Wash. Salt Lake City, Utah

The lemon packing house of the Pomona Fruit Growers' Exchange is shipping lemons as fast as they can pack. They sold a carload Feb. 10 at $3.90 per box for the extra choice and $3.60 for choice, according to J. E. Adamson, who has charge. Last summer lemons wouldn't sell at half the price. The war has reduced shipments from Sicily and has made the East more able to buy lemons.

A machine is being perfected by a Redlands man which will stamp the brand on oranges with steel dies and ink. The machine is electrically operated, the electricity also being used to dry the ink. If successful it will do away with paper stamps.

Acreage of bearing oranges by districts in San Bernardino county according to Horticultural Commissioner J. P. Coy, is as follows: Redlands 8285, Rialto 4907, West Highlands 4100, Ontario 3392, Upland 3140, Colton 2707, Highland and East Highlands 2640, Cucamonga 1979, Crafton 1555, Etiwanda 300, Chino 85, plus small lots making a total of 33,390 acres bearing oranges. The 1915 production was 11,802 carloads.

VINES AND GRAPES.

All stores in Fresno and in several of the adjoining towns will be closed February 17 for the purpose of aiding in the securing of members to the California Raisin company.

According to James Madison, general manager of the raisin company, the government reports just issued show the December exports of raisins totaled 6,435 tons, a larger figure than ever before exported in one month from the United States. Ninety per cent of these exports went to Europe, according to Mr. Madison.

One of the largest packers in the State is reported to be buying the 1916 crops of raisins in the vicinity of Arbuckle on the following terms: Thompson Seedless, $150 a ton; Sultanas, $140 a ton and Muscats $100 a ton. This is almost fifty per cent more than was offered last year by the same buyers. It looks very much like the old system of fooling the grower with high prices one year in order to keep him from co-operating.

Eight of the most prominent farmers in the Fowler district headed by H. W. Wrightson were out canvassing for the California Raisin company last week and nearly 1,000 acres were signed up. The committee got 14 farmers to sign up who have never been members and Mr. Wrightson states that the committee expects to go over the territory again before long. It might also be said that the peach growers are also canvassing the Fowler district and are meeting with success in their efforts.

GENERAL FIELD CROPS.

By developing the springs on their ranch near Paso Robles the owners of the Fair Oaks Ranch expect to grow some alfalfa on low pieces of ground.

The Balfour Guthrie company are reported to be putting their 10,000-acre holding in Imperial valley in shape for the planting of long staple cotton this year.

State standardization of berry boxes is under consideration. The proposal comes as a result of competition in measurement instead of price at present.

Hay is being shipped from Chico and other Sacramento valley points to Oregon, Idaho and Nevada where the hay supply has failed, according to a dispatch from Chico.

EXHIBITORS AT NATIONAL ORANGE SHOW.

[Written for Pacific Rural Press.]

That an orange show should turn down exhibits for lack of space is as unusual as it is usual for them to have to pad the exhibits, even at world's fairs. Yet when the Santa Paula Chamber of Commerce wanted to send two carloads of fruit to the National Orange Show at San Bernardino Feb. 17-24, they had to be refused more than a very small proportion of that space, though this is their first exhibit at the show, according to Sec'y Miss G. V. Farmer.

All the space for feature exhibits had been taken Feb. 8 and only 20 feet of display space remained for the several communities who were still talking about it. Miss Farmer says there is a greater spirit of competition and more money being spent on exhibits than ever before.

Lindsay, which won sweepstakes last year on oranges and was slow about getting into the game this year, already had her 100-box exhibit space nearly ready for the fruit on the date above mentioned, and the feature nearly ready.

Carpinteria, which took sweepstakes on lemons last year with "the finest lot ever displayed," is to have keen competition at this Show with Corona and Etiwanda.

Following is a list of the communities, etc., as given us by Manager Renfrew, which are exhibiting competitive fruit for quality: Orange County Associated Chambers of Commerce, Colton, Highland, Etiwanda, Rialto, Lindsay, Fontana, Riverside, Corona, Mutual Orange Distributors, Redlands Chamber of Commerce, Carpinteria, C. D. Hubbard Fruit Co., Santa Cruz county, Chas. Galletley.

Feature displays are by the San Bernardino Water Commission, Redlands, San Gabriel Valley, Mutual Orange Distributors, Santa Fe Railway, Pacific Electric Railway, Colton Chamber of Commerce, Lindsay, Fontana Chamber of Commerce, San Bernardino county, and Riverside Chamber of Commerce.

Cheap, Temporary Irrigation Gates are the DEAREST Kind You Can Install

The irrigation season is about to commence.

So are the troubles of the irrigationists who install temporary, inefficent gates in their work.

DO YOU KNOW that for a comparatively small outlay you can eliminate all annoyance and expense formerly caused by leaky, clumsy gates?

In the "ARMCO" (American Ingot) IRON

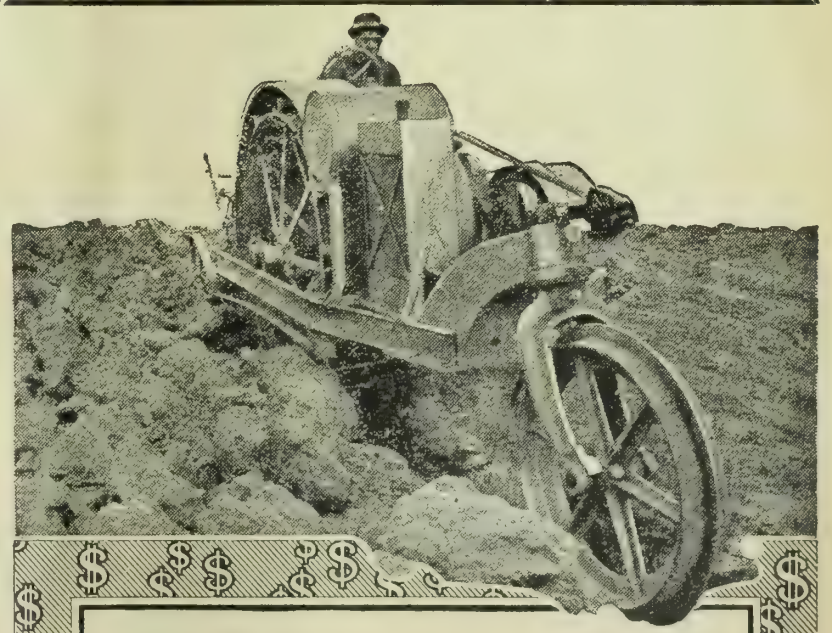
4-C Irrigation Gate

you are offered an **ECONOMICAL** and **PERMANENT** solution.

A gate which

IS FOR ALL PRACTICAL PURPOSES WATER-TIGHT.

CAN BE USED SEASON AFTER SEASON WITHOUT REPAIRS OR REPLACEMENTS.



DOES NOT WASH OUT.

WILL GREATLY DECREASE THE LABOR OF IRRIGATING. Write us for further particulars.

THE BULL WITH THE PULL

Mechanical Power on the Farm.

FIGURING TRACTOR POWER.

To the Editor: In the issue of the Pacific Rural Press dated January 8th, 1916, there appears upon page 37 an article entitled "How to Figure Tractor Horse Power." The diagram shown in connection with the article is a very good and useful one, being apparently correct to within ½ of 1 per cent which is quite accurate enough for the purpose intended.

The article, however, as it is written, is not only misleading but contains statements which are manifestly unfair. First, at the bottom of the diagram appears the legend: "Horse Power of Tractor." This should read: "Drawbar Horse Power of Tractor."

Second, the formula appearing in the second column is evidently through a misprint given wrongly. It is not necessary to point out to you that it should read as follows:

$$\frac{PxSx5280}{33{,}000x60}$$ equals Drawbar H. P.

Third, throughout the article there is evident confusion between the horse power of the tractor and the horse power of the motor. These are two quantities which are entirely separate and distinct, as the horsepower of the tractor, or drawbar horsepower, is usually from 50 to 70 per cent of the brake horse power of the motor, the difference being due to the power absorbed by the transmission and in moving the tractor over the ground. The chart should not be used in connection with the rated horsepower of the tractor, for in most all cases tractors are rated according to the brake horsepower of their motors, though sometimes both brake horsepower and drawbar horsepower are indicated in the rating, as, for instance, when a tractor is rated at 75/40, where the first figure refers to the brake horsepower and the second to the drawbar. That the article in question has confused these horsepowers is shown by the example given in the second column, in which one is directed: "Find the vertical line which corresponds to the horsepower rating of the engine or motor."

This should read: "Find the vertical line which corresponds to the drawbar horse power of the tractor."

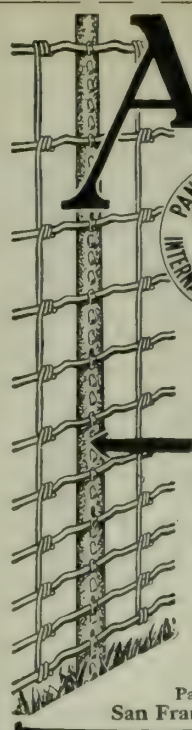
Fourth, another serious and self-evident misprint is in the latter part of this example, where the instructions continue:

"Then follow the intersecting horizontal line to the left, obtaining the drawbar horsepower delivered."

This should read:

"Then follow the intersecting horizontal line to the left, obtaining the drawbar pull of the tractor."

Fifth. The editor's note at the end of the article is misleading indeed to a tractor user. The part of the note we have reference to is as follows: "If one has a tractor of known horsepower and wants to pull a load four miles per hour on a level road, he could figure how much of a load is possible."



This statement is very apt to be misleading unless the tractor owner can distinguish between the actual tonnage drawn and the pull in pounds required to handle the tonnage. For instance, a tractor of 40-drawbar horsepower will easily haul under favorable conditions about 20 tons, although the drawbar pull while handling that load would be only about 6500 pounds.

The chart is such a good and useful one that the writer is very anxious to see it again published with the article re-written so as to enable a tractor operator to handle the chart intelligently and to avoid falling into the errors which have been pointed out in this letter.

I want to assure you that this letter is written, not for the mere sake of criticism, but because of the very excellence of the chart and also because we feel quite certain that you would want us to point these things out to you. C. Parker Holt.

COMMENTS BY THE AUTHOR, WM. KRITZER, SAN FRANCISCO.

When a farmer purchases a tractor he is not concerned in the stationery engine or motor horse power, but

American Fence and Steel Fence Posts

AWARDED PANAMA PACIFIC GRAND PRIZE INTERNATIONAL EXPOSITION

in what it will do on the drawbar pull, the other being a secondary consideration.

The paragraph under chart "Horse Power of Tractor" is merely to designate and make clear the horse-power-rating figures that appear just above it, as it is self-evident the information in circle on chart corner should give the reader a plain understanding of what it is to be used for.

The second criticism was taken care of in your issue of January 22 and was a typographical error in my article.

Regarding the third criticism, would say that the article could have been more specific and have stated the drawbar horse power rating of traction engines. Quite often a tractor is only mentioned as an engine, or farm engine, and appears in manufacturers' catalogs that way.

Mr. Holt is correct in his fourth criticism, but on left side of chart in large letters it states what the result obtained will be—"Tractor Drawbar Pull in Pounds."

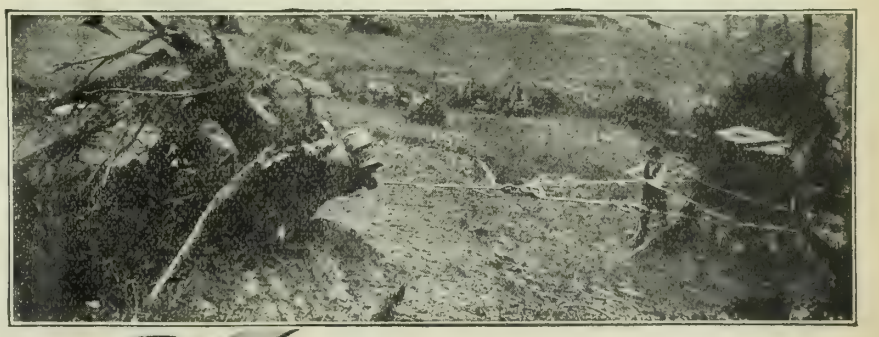
VERTICAL PIPE NOT JUSTIFIED.

To the Editor: We are lifting water to a height of 37 feet, through pipe 160 feet long laid on an incline. Would there be anything gained by having a 37-foot vertical pipe instead and would it be worth the expense to make the change?—H. B., Santa Ynez.

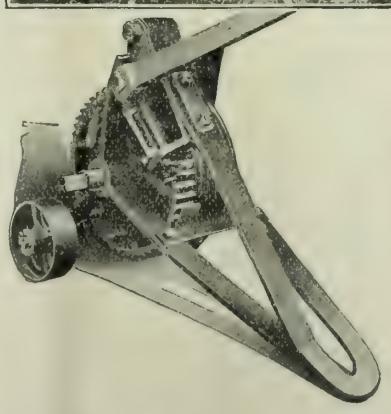
[Answered by J. B. Davidson, Prof. of Agr. Engineering, Univ. Farm, Davis.]

In pumping water through a pipe to some distance, there is not only the vertical head due to lifting the water to be overcome, but also the friction head due to forcing the water through the piping. It would not make any material difference whether the pipe was raised at the pump or not. The friction head varies not only with the size of the pipe but also the length and rate of flow.

Under the circumstances the change suggested would not justify the expense.



FERTILIZING VALUE OF BEAN WASTES.



The Ventura Farm Bureau remarks that although the greatest value of either the lima or the blackeye straw as a fertilizer comes from the resulting humus the fertilizing ingredients are of interest to many farmers.

Per 100 pounds:	Total phosphoric acid	Total nitrogen	Total potash
Lima bean straw	0.30 lbs.	1.37 lbs.	1.57 lbs.
Blackeye straw	1.20 lbs.	0.94 lbs.	3.71 lbs.
Cull lima beans	0.80 lbs.	3.07 lbs.	1.94 lbs.

The value of the above materials in terms of commercial fertilizer can be obtained by reference to the following data: Nitrogen, 18c; Phosphoric acid, 4c; Potash, 4½c per pound.

Be sure to turn the switch onto the magneto after the motor starts and advance the spark (unless your motor is equipped with a Sevison Automatic Spark Advance Magneto).

Any Stump

that any horse power machine can pull, you can pull with the K **Hand Power** Stump Puller—without digging, and without the expense of teams and powder. I guarantee it. I refer you to U. S. Gov. officials. I give highest banking references. If you have stump land, the cheapest way of clearing it is with the

HAND POWER
K Stump Puller

A mechanical wonder. Works on the leverage principle. 100 lbs. on the lever develops a 96,000 lb. pull on the cable. Pulls biggest stumps—all an inch steel cable will hold. Made of Krupp steel—weighs only 171 lbs.—two speeds.

Endorsed by U. S. Government experts. Works equally well on hillsides and marshes where horses cannot operate. Owners report clearing from 50 to 100 stumps per day. Lasts a lifetime—guaranteed against breakage.

RAISING GOOD CROPS OF ALFALFA.

[Written for Pacific Rural Press.]

L. T. Van Slyke, who has a dairy near Ripon, San Joaquin county, and who sells most of his milk there, averaged nearly nine tons of alfalfa per acre last year on his 15 acres.

He accounts for this large yield to the fact that he has his checks perfectly graded so that the entire 15 acres are irrigated just the same. He gets plenty of water on the ground when it needs it, and as soon as it is thoroughly soaked he gets it off again. No high spots or low places, where the water will stand for a day or two, are to be found in his fields.

Mr. Van Slyke believes in thoroughly renovating his alfalfa every year, but says it should be done before February 1, as after that there are a large number of new shoots coming out that get torn off and do not get started again in time for the first crop.

In cutting he starts just as soon as the plants are well budded out, and if the weather is warm and dry, he follows the mower with the rake by about three swaths. By getting it into the shock in this manner he saves practically all the leaves and the hay is not so woody and dry. Some that was being fed in February looked as if it had just been hauled out of the field.

Mr. Van Slyke expects to build a hay barn shortly and will chop and blow his alfalfa into the barn. He believes that there is 20 per cent less waste in feeding this way than when fed loose, as the cows eat the coarse stems as well as the leaves and finer stems.

SILAGE VERSUS PASTURE.

[Written for Pacific Rural Press.]

"I used to pasture my cows a great deal, but I can't see that it pays," says F. H. Vander Poel of El Centro, who is milking 18 Jersey cows, and has a large bunch of young stock. His cows are kept in the corral and fed cut green stuff, such as alfalfa and grain during summer, and silage in winter with beet pulp and hay. He gets 4 tons of oat hay per acre in one cutting, but 8 or 10 tons of alfalfa; and the milk stock does better on the latter.

However, cutting and hauling the green stuff daily involves too much work. He has tried out a 40-ton De Laval silo with one crop of feterita; already plans to have another bigger one, so he can feed only silage and alfalfa hay with perhaps some beet pulp.

"I wish the silo were at least a size larger."

So have many others wished, after learning from experience the value of this feed.

He was feeding in January about 25 pounds of silage to each of the milking stock every evening. In the mornings he would feed about five pounds beet pulp with alfalfa or oat hay. Though some of them were heifers and others six months along, the herd was averaging better than a pound of fat per day. This is due partly to the purebred sire of all of them and the purebred dams of some, and partly to the constant supply of succulent, appetizing feed without having to rustle for it.

THE "BOSS" TREE PROTECTOR

Can High Priced Feed Be Porked Off?

To the Editor: During the past year alfalfa hay has varied in price from $10 to $18 a ton, averaging about $14 per ton in this section. Barley has averaged about $1.25 per hundred and corn $1.50. Hogs during this time have averaged 7½ cents a pound. Under such conditions do you think it profitable to raise hogs on alfalfa pasture and barley or corn? Could you give any suggestions as to feeding under such conditions? What would you consider the maximum value which alfalfa hay, corn and barley could have, if hogs are sold at 7½ cents per pound?—J. M. F., Spadra.

[Answered by Prof. R. L. Adams, Farm Management Dept., University of California, Berkeley.]

In estimating the amount which can be paid for feed in the production of any animal or animal products, deductions from the prices obtainable must first be made to cover the items of:

(a) Interest and depreciation on stock animals.

(b) Interest and depreciation on land, buildings, equipment suitable and necessary for the carrying on of the business.

(c) Operating expenses, including such things as taxes and labor.

(d) Materials other than feed, as charcoal, salt, sulphur, whitewash, and the like.

The first step in answering the accompanying query would therefore consist in determining the figure necessary to cover these items.

Assuming for the sake of the illustration (and it can only be an assumption since the actual conditions are not stated) that the hogs are handled intensively, sold at seven months old, weighing 175 to 200 pounds, and that careful computations indicate that 2½c per pound must go to offset these charges, there is then left available for the purchase of feed, the sum of 5c—if 7½c net is received for the pork.

Hogs should be pastured on alfalfa only during dry weather if the greatest returns are to be secured from the alfalfa. This means that other feed, or run-out alfalfa fields not really fit for hay purposes, should be available for the period between November or December 1, and March or April 1.

In this illustration we will assume that the alfalfa is pastured throughout and is capable of supporting only 1,000 pounds of pork per acre. It is to be understood that this is low, as good alfalfa should support as high as 2,000 pounds of live weight regularly.

If the hogs are fed intensively upon barley, 325 pounds of grain will be required to bring a hog to the weights indicated above at 6½ to 7 months of age. At $1.25 per cwt. grain will therefore cost a few cents over $4.00. If the hogs average 190 pounds, the sum available for feed is $9,50, less the grain, thus about $5.50 is available for alfalfa.

Of the two feeds mentioned to be fed with alfalfa, at the prices given, barley will prove to be slightly cheaper, although the advantage is slight.

From the acreage 12 head of pork will be available annually for sale, in addition to sufficient feed to maintain the herd. Twelve head will therefore pay $66.00 for the use of the alfalfa, even at the low limit of 1,000 pounds, which is assumed in this case. This is an exceptionally low figure when alfalfa is properly supplemented with winter pasture. Some hay will also be secured in addition to the pasture.

In comparison with $66.00 obtained in this way, is the returns on a hay basis. Figuring a 5-ton crop, the receipts at $14.00, less cost of harvesting, leave a gross profit of about $50.00.

In the above the aim has been to indicate the line of reasoning needed to formulate an answer, rather than to give a direct answer to the question asked. The data is insufficient to permit the latter.

In answering the request for information concerning feeding, the best hog men expect alfalfa to make up 50 per cent of the food ration, feeding the balance as grain, or its equivalent in skim milk or concentrated feed stuffs. The grain ration fed is based upon the live weight of the hog, 4 per cent being figured a full ration. Hence for hogs averaging 100 pounds, the grain ration will be two pounds per day. The ration is gradually increased to conform to the increase in the growing hogs—being at all times equivalent to 2 per cent of the live weight.

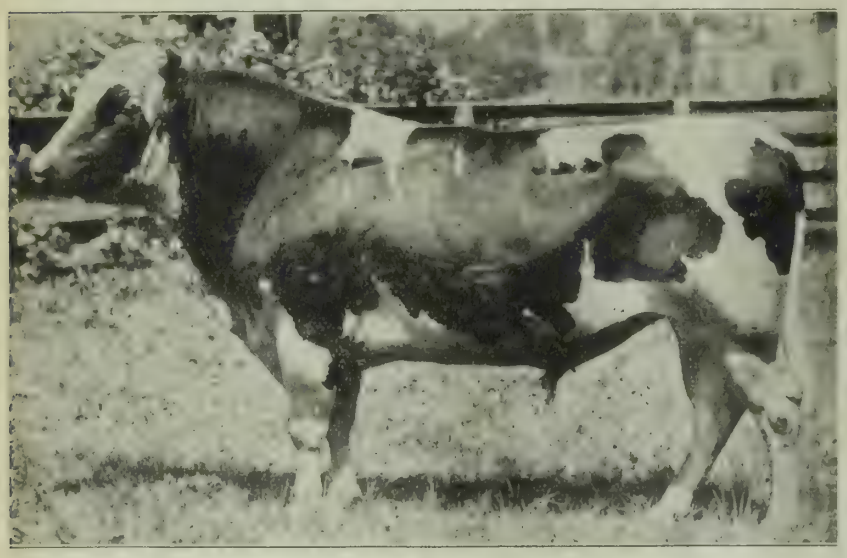
Holsteins for Southern California.

McAlister and Sons of Chino write of their recent importation of Holsteins as follows: "The 104 head of Holsteins which we have just received from the east are, we believe, the largest and finest herd of the breed ever brought to the Pacific coast.



"Among them is the bull, King Segis De Kol Korndyke, that we have selected as our senior herd sire. He is the sire of the world's champion junior four-year-old cow, Mable Segis Korndyke, whose 30 day record was the second largest ever reported, regardless of age. He is also the sire of a 33 pound and a 30 pound daughter, and the sire of King Korndyke Sadie Vale, whose daughters have made sensational records.

"We also bought three sons of this bull. One of these young bulls, out of a 30-pound daughter of King Wayne Pietertje 2nd, who is the highest record cow in the State having a seven-day record of 34.35 pounds of butter and 639.6 pounds of milk as a three-year-old. She also made over 26 pounds as a two-year-old. Her two-year-old daughter is in the lot, she being sired by King Segis De Kol Korndyke and in calf to King Korndyke Sadie Vale. The above were purchased from the McAdam herd in New York.

"From Stevens Brps. we secured 13 head, one being May Korndyke. Other animals are daughters of Spring Farm King Pontiac, Rag Apple Korndyke 8th, King Segis De Kol Korndyke and eight daughters of King of the Pontiacs.

"We also purchased 31 head from H. M. Dunham and Sons, including 20 animals with records from 18 pounds as yearlings to over 30 pounds at full age.

"We think that with over 150 females to be bred to him every year, our senior herd sire will have a better opportunity than any bull in the West has ever had."

King Segis De Kol Korndyke.

Segis De Kol Korndyke, we intend to keep as our junior herd sire.

"Nine of the females in the lot are in calf to King Korndyke Sadie Vale, including four 30 pound cows. Chief among these is Star Rena

One Way of Obtaining a Purebred Herd.

[Written by Prof. E. L. Westover, Dept. Dairy Husbandry, California Polytechnic School, San Luis Obispo.]

Good cows are the basis of profitable dairying. To become a breeder of pure-bred dairy cattle does not require a lot of capital, provided a person can be satisfied to grow into the business rather than go into it. If you already have a dairy herd then the use of the Babcock tester and a spring balance scale is the only certain way of determining just how much milk and butter fat each cow is producing. If you have not a herd then the first thing to decide is what breed meets with your approval and is best adapted to the natural conditions of your section. Before deciding upon this point, study carefully your climate and country, deciding whether you want producers of butter fat or market milk. When this point is decided, then is the time to make your purchases or begin weeding out those cows which the Babcock tester indicates as the poorer members of the herd. The next step is to secure a bull of good breeding and breed him to the herd as also to the calves raised from the best cows.

Must Raise Calves.—More and more, thoughtful dairymen are coming to realize that in order to have profitable herds they must raise and develop their own cows. Men who have good cows are not anxious to part with them, and the dairyman who depends upon the purchase of mature cows to keep up his herd is forced to pay some one a handsome profit for raising them or else be content with the culls of other herds. It is a fact that most of the best-producing herds in the country have been bred and raised by the men who own them.

The first step in increasing the standard of the herd is the determining of the herd boarders. This can be easily done by means of the Babcock tester and a daily record of the weight of each cow's milk. Secure a good spring balance scale which can be adjusted to read zero with the pail on the hook. Rule up a sheet similar to that which the creameries and cheese factories use, using a sheet for each cow. It is best to

REMCO
REDWOOD PIPE

All diameters from 2 inches to 12 feet. Much cheaper than any metal pipe. Will carry 30 per cent more water than metal or cement pipe of same diameter. Will outlast any metal pipe except cast iron. Cannot be injured by roots or displacement. Furnished for any pressure from 0 to 400 feet, and guaranteed for 100 per cent overload.

Write for further information, prices, etc.

REMCO
Redwood Tanks

Cheaper than metal tanks. Last longer. Cannot rust. Not affected by chemicals in water. Thousands in use in the West.

We make them in all shapes and sizes, from 200 gallons to 500,000 gallons.

Brighton Herd of Shorthorns, Established 1880.

BIG TYPE POLAND CHINAS

Gilts from Weanlings to one year old. Bred or open. Boars from weanlings to 8 months.

THE BROWNING STOCK FARM,

W. H. BROWNING, PROP. WOODLAND, CAL.

rule the sheets for seven day records as they do not get soiled so badly and are added without as great chance of error as the larger sheets. These record sheets should be placed with the scales in a convenient position in the barn or near the place of milking, the milk of each cow weighed at each milking, and the weight recorded on the sheet. The testing of the milk for butter fat can be done weekly or monthly. The practice of making the test once each month meets most requirements. By keeping careful tab on these tests the dairyman is enabled to determine which cows in his herd are producing enough butter fat to make it worth while to keep them. Nothing less than 200 pounds of butter fat per year will do this. By careful selection you can increase this 50 pounds, but the dairyman should not be satisfied until he has reached at least 400 pounds per year. To be of value, this test must not only extend through several weeks or months, because several milkings do not demonstrate a cow's value, but the cow must receive proper care and good feed, otherwise a good cow will not show satisfactory results when subjected to this test.

Star Rena Wayne Pietertze, seven day record, 34.35 pounds of butter.

How Many to Raise.—After the herd boarders are weeded out, the data obtained should be used in guarding against the raising of those calves which are not from the best cows in the herd. It is estimated that, on an average, one-sixth of the cows in a herd each year reach an age when it is no longer profitable to keep them. Therefore, there should be raised each year not fewer than one-sixth as many heifer calves as there are cows in the herd, to replace those cows which must be disposed of. The knowledge and experience gained by raising and developing the grades is not only useful and profitable but becomes exceedingly interesting when it is possible to purchase a pure-bred heifer or two as a foundation for new stock. While the experience acquired in the selection of a pure-bred heifer is important, yet it cannot be compared to that gained only through the selection of a pure bred bull. This step of selecting the bull places the dairy farmer in touch with the breeds of dairy cattle and awakens him to the fact that there is a great difference in bulls. To the dairyman the pure-bred bull is an educator, for if the proper thought and importance is attached to his selection, he leads men to study.

Selecting Purebreds.—With the selection of a pure bred bull and two heifers, coupled with the weeding out of the herd boarders, it requires but a few years to build up a good herd of pure-bred cattle. In the selection of pure-bred heifers, care should be taken to select good animals, but in the selection of the bull, greater care should be exercised for it is through the bull that the herd as a whole is improved. In other words, the bull has an influence on every calf born in the herd, while the cow influences but one calf each year.

The Missouri Station has followed the history of two bulls as shown by the production of thirty daughters of each. One of these bull's daughters produced $18,000 more dairy products than did the daughters of the other. Yet we hear plenty of dairy farmers (?) say every day they cannot afford a good bull. The question is can they afford not to have a good bull.

Before selecting that sire, take time to look around. There are good sires and poor sires, and the same in pure-breds as in scrubs, only some may not be quite so poor, but so poor that you cannot afford to have them at the head of your herd.

Be sure that the sire you select has a good butter record behind him, and do not buy anything undersized that the breeder says is just a little backward in development.

When you begin using a good bull do not allow him to run with the herd, as he injures not only himself but the cows also. By setting down the date of services you will know when to expect the different cows to calve and thus lose fewer calves.

Very often aged bulls that are good breeders are offered at prices little above their value for beef. They are harder and more dangerous to handle than a yearling, but this should not prevent a person from purchasing the aged bull, especially if he has proven himself a getter of good stock just as a cow must prove hers at the pail.

To summarize briefly the steps to be taken by a dairy farmer who desires to become a breeder of pure-bred cattle:

First, decide on the breed that is preferred and meets conditions best.

Second, begin to weed out the boarders by the use of the Babcock Tester and scales.

Third, select a well-bred bull and when possible, one that has proven himself a getter of good stock.

Fourth, when finances and experience will permit, buy a pure-bred heifer or two; from these animals, grow pure-bred herds.

At the annual meeting of the Madera Co-operative creamery, the stockholders decided to change the institution from a co-operative to a stock company.

"Corn Silage Worth 1/3 More Than Hay"!

Bishop, Cal., Jan. 21, 1916.
The Chas. K. Spaulding Logging Co., Salem, Ore.
Gentlemen:
I wish to say that the Indiana Silo purchased from you last summer has been filled with corn. THE SILAGE HAS KEPT IN PERFECT CONDITION and the CATTLE EAT IT WITH GREAT RELISH.
The plans of construction sent with the silo are so complete and simple that no trouble is experienced in erecting the silo.
My short experience teaches me that the silo is going to give the dairy interests of Owens Valley a great boost.
Yours very truly,
WM. ROWAN.

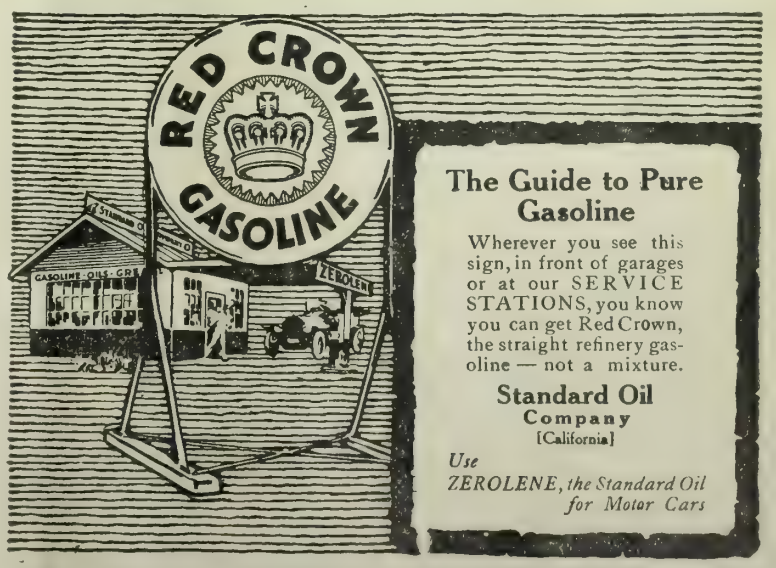
"Indiana Silo" on Wm. Rowan's Ranch Bishop, Calif.

"Silage kept in perfect condition," says Wm. Rowen, prominent California dairyman and stock raiser, and booster for Indiana Silos.

In one way or another, men who bought Indiana silos last year are enthusiastically telling us of the good results obtained. Isn't it time you investigated?

A little preparation on your part now, will do away with a lot of cold, wet, muddy work in next winter's feeding; it will cut down your feed bills, and it will give you cream checks of a size that will give your bank account new life.

Reserve some ground for silage crops this year. Then complete your preparations by ordering your



INDIANA SILO

with delivery to suit your convenience.. Order early. Get your silo up ahead of the rush of spring work. Be prepared to save your grain and hay crops, regardless of rain at harvest time. Be prepared to furnish your stock with a rich succulent feed during the dry summer months. Be prepared to get 100% feed value from your corn crop next fall. Join the great army of Indiana Silo users—almost 60,000 SUCCESSFUL farmers, dairymen and stock raisers.

Mail the coupon now for our New Free Silo Book—a valuable addition to any farmer's library. No obligation, whatever.

DAIRYING.

The Harwood and Williams Ranch Co., of Poplar, Tulare county, have just received a fine young Holstein bull to be used on their dairy herd.

Silage fed the present season to dairy cows by E. Hertrich of Pomona is reported to have noticeably increased the fat test, though not the milk flow.

H. H. Ford, a large orange grower of Redlands, is establishing a purebred Holstein herd for his alfalfa ranch near Highlands. He is buying young stock to raise.

Only the intradermal test for tuberculosis is used practically in California according to Dr. Tyler of Pomona, though in Oregon only the thermal test is officially recognized.

Mr. A. W. Longley has sold his interest in the Aberlour Purebred Holstein Co., located in Inyo county, to Chas. F. Mohnike of San Diego. This is probably the finest breeding establishment in the mountain sections of California.

A report from Stanislaus county states that A. L. Pedalty has purchased a 40-acre ranch near Hughson which he is checking and seeding to alfalfa and on which he expects to establish a modern set of buildings and a fine dairy herd.

F. H. Vander Poel of El Centro has 10 registered female Je rseys and a registered bull. He also has more than that many grades. "I konw the purebreds pay better. There is no doubt about that. I am getting all the purebreds I can," says he.

Probably the only purebred Guernsey herd in the neighborhood of Pomona is to be dispersed at private sale by I. J. Scott who expects to work entirely in his orange orchard near Whittier. They have all passed the tuberculin test.

Seventy-three pounds of milk per day for three months with her second calf is the record of a purebred unregistered Holstein cow which recently gave 65 pounds with her fourth calf two weeks old. D. W. Anderson of Pomona, who owns her, says her milk flow was still increasing then.

In order to furnish Alaska settlers with a breed of dairy cattle suitable to the needs of the country the government now has a herd of 50 Galloway cattle on the Kodiak Island Experimental Farm. Careful record is being kept of their milk production and only those with the largest milk records are being kept for breeding purposes.

Farm Adviser Niles Searles of Yolo county reports that another movement is under way by farmers of that county to organize a cow-testing association. He recently visited Williams, Colusa county, to interest dairymen there in the association, his plan being to take in dairymen from counties adjacent to Yolo. There have already been about 750 cows signed up.

The Riverdale Co-operative Creamery Association manufactured 827,136 pounds of butter during 1915, a gain of 77 per cent over the previous year. The total income for the year was $234,276.03. The same officers and directors were elected that served last year. An attempt will be made in the immediate future to organize a cow-testing association in the district by the creamery manager.

As an indication of the producing ability of the cows being tested by the San Joaquin County Dairymen's Ass'n, H. J. Culbertson, tester for that association, sends us a list of 22 cows which made more than 45 pounds of fat during January. Four Jersey cows owned by the N. H. Locke Co., of Lockeford, head the list, Empress Lass giving 1649 pounds of milk containing 82.4 pounds of fat; Dereen's Lassie of L., giving 1265 pounds of milk with 64.7 pounds of fat; L. of L. Midget giving 1195 pounds of milk with 59.9 pounds of fat and Gerties Foxy Alene giving 1035 pounds of milk and 55 pounds of fat. Other owners of cows in the list were Mrs. E. C. Clowes, E. B. Goodwin, L. Moreing, County Farm, J. E. Thorpe, R. T. Wilkerson and J. A. Aggeler.

SWINE HAPPENINGS.

J. E. Brumel of Ceres is developing a Berkshire herd. He has found that breed a good paying side line of the fruit business.

According to E. Wiglesworth, president of a large hog cholera serum plant of Kansas City, Imperial county, and especially that section around Holtville, is the greatest hog-raising country he has seen.

Ed. E. Johnson, the veteran Duroc Jersey breeder of Turlock, writes that he has sold 47 head of registered Durocs in the last three months, which indicates that Stanislaus Durocs are in demand.

Dr. Cady, of the U. S. Dept. of Agr., is at present in Imperial county where he is giving lectures on hog cholera and its control. Dr. Cady has done an immense lot of good work in both of the large valleys of the State along this line.

Swine breeders are to hold a show of their own in the east this year as a result of the efforts of the National Swine Growers' Ass'n. Cash prizes aggregating $10,000 will be offered. The first show will be held at Omaha, Nebraska, October 2 to 7.

G. D. Willoughby and Sons of Calexico use 13 purebred Duroc boars. One is B. Commander Chief out of Commander Chief; another is a son of Slocum's Crimson Wonder, which was the sire of the World's Fair Champion California's Defender.

At a special meeting of the directors of the Standard Poland-China Record association and the American Poland-China Record association at Kansas City, Feb. 8, it was unanimously agreed to consolidate the two records. This is the most important piece of breed news that has gone out in a good while.

In line with their endeavor to obtain the best breeding animals available for their purebred herds of livestock the University of Nevada have recently purchased a young son of Laurel Champion and out of Miss L. 2nd, which they will use as herd sire on their Berkshire herd. They have also secured a son of Nevada Volunteer out of Rena Dewdrop to head their herd of Duroc Jerseys.

Carruthers Farms reports the sale of one boar to the Timpkin Ranch Co., at Brawley; one sow to Sam Wright, Santa Rosa; three sows and a boar to Dr. Robertson, Yreka, and

TUBERCULOSIS TESTING MUST BE OFFICIALLY DONE.

[Written for Pacific Rural Press by Charles Keane, State Veterinarian.]

Many letters are received at this office from dairymen, as well as from veterinarians, asking if certificates issued by practicing veterinarians showing that a dairy herd has been tested for tuberculosis will be recognized by this department when the new dairy law becomes effective October 1, 1916.

I understand that many dairies are being tuberculin tested under the misapprehension that such certificates will be so recognized.

In order that this may be clearly understood, I wish to advise that under no circumstances will such certificates be recognized, for the law does not become effective until October 1, 1916, and it clearly contemplates that all tuberculin testing shall be officially done by official veterinary inspectors.

SWINE.

BIG TYPE POLAND CHINAS—One to a carload. Any age, either sex. 600 on hand. They have plenty of size, extra good hams and shoulders, strong arched backs, great length, depth and thickness of body, with good looks as well. Many are sired by IOWA WONDER, a 1000-pounder in show condition. I believe his pigs are the best in California. Visitors say they are the best they have ever seen. He sires the kind that grow faster and larger, have more, better and stronger pigs, and are more practicable and profitable—the kind that are highly satisfactory. Extra special prices on account of being overstocked. I have hogs galore. Prices will surprise you. Satisfaction guaranteed. Write Geo. A. Smith, Corcoran, Cal.

BILLIKEN HERD OF IMPROVED CHESTER WHITES—Everything registered and Cholera Immune. Have two young boars of service size and a few bred gilts to offer. These are extras in every way. Price very reasonable. Have recently received some bred sows from the East that are from Grand Champions and are bred to Grand Champions, from the best and most popular blood lines. Will have an attractive lot of pigs to offer from the coming spring farrows. These will be the equal of any raised in this country. Am booking orders now for same. Write for prices and catalogue. C. B. Cunningham, Mills, Sacramento County, Cal.

YOUNG'S POLAND CHINAS—Large type boar, "I. B. A. Wonder" won first in class and Reserve Champion P. P. I. E. 730 lbs. under two years in breeding condition. Sows bred and sired by "I. B. A. Wonder." Also weanling pigs, either sex. Trios unrelated. None bigger. None better. $15 and up. Will please you or money refunded. W. A. Young, Lodi, Cal.

BLUE RIBBON HERD OF DUROC JERSEY HOGS—With 125 head of choice gilts and boars sold in year of 1915, I am going to sell 150 head in 1916. They sell because they are choice, and people are given a Square Deal on good ones. I have no $10 and $15 kind I don't have to auction them off. John P. Daggs for prices, Modesto, Cal.

REGISTERED DUROC-JERSEYS—Prize-winning stock from Iowa, Nebraska and Wisconsin. 75 head—bred sows and gilts. Also weanlings in groups of from one to five and boar unrelated of Crimson Wonder, Golden Model, Alvancer, Golden Hero, Orion, Chief and Colonel blood. Price $10 and up. Haden Smith, Route 1, Box 97A, Woodland, Cal.

HAMPSHIRE SWINE—Both males and females from Grand Champion 700-lb. boar and Grand and Junior Champion sow. Also Guernsey bull calves from Grand Champion bull. BELLA VISTA HERD, J. W. Henderson, 1st National Bank Bldg., Berkeley, Cal.

REGISTERED BERKSHIRES—World's Fair Grand Champion at the head of the herd. Also winners of Senior, Junior and Reserve Grand Champions. Stock of all ages for sale. Grapewild Farms, A. B. Humphrey, Prop., Escalon, San Joaquin Co., Cal.

BERKSHIRES—I have one of the best herds on the Pacific Coast, including Grand Champion Sow, Reserve Grand Champion Boar under one year, Third Aged Boar, etc. Frank A. Brush, Santa Rosa, Cal.

REGISTERED BERKSHIRE WEANLINGS, both sexes, unrelated, $10 each. Also older boars and open gilts, or bred to a fine son of Grand Leader 2nd. J. M. Bomberger, Modesto, Cal.

BLATCHFORD'S PIG MEAL weans easily and safely; no trouble; no milk. Write for free folder, "The Safety Route from Pighood to Porkage." Coulson Co., Petaluma.

CROLEY'S BALANCED PIG FEED for growing youngsters; also cheaper hog feeds for big hogs. Geo. H. Croley Co., Inc., 631-637 Brannan St., San Francisco.

REGISTERED PUREBRED BERKSHIRE PIGS—Weanlings—both sexes. Reasonable prices. Write for full information. J. E. Hall, Sebastopol, Cal.

CHESTER WHITES (O. I. C.'s)—Bred gilts, $30. Bred sows, $45. Weaned pigs, $10. Also a fine herd boar 20 months old. D. Bache, Hollister, Cal

LITTLE BLACK ESSEX—Service boars and weanlings. Only herd in the State. Limited supply. Yolo Essex Herd, L. W. Millsap, Yolo, Cal.

ROSELAWN STOCK FARM—Registered Poland Chinas and Shorthorn cattle. Young stock, both sexes, for sale. T. R. Gibson Estate, Woodland, Cal.

DEL DAYO FARM (Old Haggin Bottom Ranch)—Breeders of registered Berkshires. Both sexes for sale. Stephen A. Day, Box 1140, Sacramento.

RANCHO RUBIUS—Durocs all sold except one service boar and a few October pigs. Spring litters will be "best ever." Elmer Lamb, Ceres, Cal.

IMPERIAL STOCK FARM BERKSHIRES—Registered stock of all ages. Price and description on application. R. J. Merrill & Son, Morgan Hill.

LAKESIDE STOCK FARM POLAND CHINAS are money makers. Satisfaction or money refunded. Geo. V. Beckman & Sons, Lodi, Cal.

REGISTERED DUROCS—Fall farrowing. Choice boars and gilts. Crimson Wonder and Model strains. Felton & Hoyt, Hanford, Cal.

POLAND-CHINAS — While the advertisement is short the hogs are long—of the big-boned type. C. A. Cooley, Durham, Cal.

DUROC JERSEY HOGS—For sale, boar and 4 sows. Boar not related. All thoroughbred. Address Box 208, Pacific Rural Press.

15 sows and a boar to C. C. Moore of San Francisco. This company has also purchased three Rival's Champion Best sows and one Rival's Champion Best boar, for their herd at Mayfield.

Elmer Lamb of Ceres purchased two bred Duroc gilts at the Watt and Foust Duroc Jersey sale held at Xenia, Ohio, recently. Their dam is also the dam of the famous boar Mortgage Lifter and other show ring winners and will greatly add to the strength of Mr. Lamb's herd. The boar received from the east recently to head this herd is looking well and should sire some fine pigs.

BEEF CATTLE.

Hayes and Devaney have begun the moving of their cattle from the valley lands to their hill ranges back of Livermore.

Eight cars of cattle and four of sheep, having a total valuation of $25,620, were recently shipped from Carson Valley, Nevada, to the San Francisco market.

The annual cattlemen's meeting was held in Glennville, Kern county, recently, at which time permits for government grazing lands were allotted them by the government officials.

Stockmen of San Benito county are being urged to keep a careful watch for rabies among the coyotes, as it is strongly suspected that rabies exists in certain sections of that county.

A report from Hollister states that while weather conditions in the cattle ranges adjacent to that town have been exceptionally severe the past month, scarcely any loss is reported, although many stockmen were forced to feed hay. The cattle were in good condition before the snowstorms and were better able to stand the cold for that reason.

Carruthers Farms report the sale of five Crookshank cows and a bull to the Fair Oaks Ranch at Willits. Three of these cows are Orange Blossoms, one a Goldendrop and the other a Victoria. Mr. Thayer, owner, of the Fair Oaks Ranch, has been breeding Shorthorns for several years and these Scotch cows will be a valuable addition to his herd. Mr. Carruthers also reports the sale of four Shorthorn bulls to Mr. Orvis of San Joaquin county; two Shorthorn bulls to C. C. Moore, San Francisco; two Shorthorn bulls to the Hearst Estate; two Herefords to the Newhall Land and Cattle Co.; 20 Hereford cows to W. T. Sessnon and four Shorthorn bulls to Fred Wadsworth, Yreka.

SHEEP.

Sheep men report having a difficult time saving the lamb crop on their ranches near Willows, owing to the bad weather the past few weeks.

The well-known Rambouillet sheep breeder, Chas. Kimble of Hanford, has just given the University of California six of his finest purebred Rambouillets, which will be added to the Rambouillet flock at the University Farm at Davis. The University Farm has been badly in need of more sheep of this character and Mr. Kimble's gift was most appropriate.

A report from Winnemucca, Nevada, says that several wool buyers have been there recently, lining up the spring clip and while announcement has not been officially made it is understood that John G. Taylor and the Golconda Cattle Co. have contracted their wool at right around 20 cents.

SWINE.

REGISTERED BERKSHIRES—For sale bred sows. Boars ready for service and weanling pigs C. H. Thompson, Novato, Cal.

GLENVIEW POLAND-CHINAS—Baby Pigs from best families for sale. From $15 up. Chas. R. Hanna, R. 3, Riverside, Cal.

"Jackson MADE"

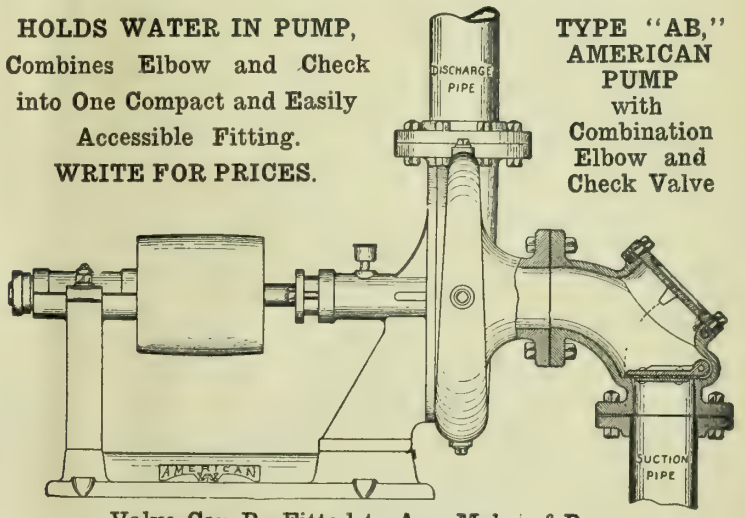
Write for Catalog No. 47 F

A Better Maker Not Made

For Water Deep Under The Ground

Jackson Deep Well Turbine Pumps give continuous and efficient service. They do not get out of order as they have no valves or plunger rods. Very little care or attention needed as they are oiled from the surface. Are much lower in cost than other types of deep well pumps when the expense of dug pits, cribbing and timbering is reckoned. They raise water from the very bottom of the well, thus eliminating heavy vacuums and delivering all the water the well yields. They develop slow wells and increase their flow.

Like all Jackson Made Pumps These Deep Well Turbine Pumps Are the Very Best Pumps Made for the Purpose—They are Dividend Earners, Not Expense Makers



Whatever your water problems may be our Expert Pumping Engineers will help you out free of charge—write

Veterinary Queries and Replies.

[Answered by Dr. H. B. Wintringham, Petaluma.]

Correspondents desiring a reply by mail should send money order for $1.00. No charge is made when questions are answered through this department.

NO REMEDY FOR FOUNDERED HORSE.

To the Editor: Is there anything that can be done for a horse that has been foundered? This is of several years' standing. He travels bad on hard road, also seems to have rheumatism in cold bad weather when he has to stand in the stable.—W. L. K., Florin.

[There is no remedy. Shoe with a wide web concave shoe.]

CHOLERA.

To the Editor: I have a sow that had five pigs, two of which have died. They shook continually as if in chill unless lying close against the mother's body. The three that are left are about three weeks old, eat well and doing fine but continue to shake about the same. They are in dry pen with plenty of dry straw. What is the cause and the remedy?—J. B. F., Turlock.

[This is cholera. They will probably outgrow it.]

SHOULD KEEP BREEDING DATES.

To the Editor: I have a young heifer with second calf that is supposed to come fresh in June but looks like she would come fresh much sooner. She gives very little milk lately and that is stringy. What can be the matter with her?—L. F. P., Sacramento.

[Keep better track of your breeding dates and you will know better when your cows are to freshen. This animal has garget, which has been fully prescribed for in past issues of the Press.]

ULCERATED TOOTH.

To the Editor: One of my cows seems very eager to eat her feed, eating very fast, but only about half the amount she should. I feed grass and alfalfa hay and some carrots and grain. She will freshen in April. I have not milked her for two months. She is dropping off in flesh every day and her dung is loose and very coarse. What can I do for her?—J.H. H.

[This cow has an ulcerated tooth. Have it removed.]

HORSE WITH GROWTH ON LEG.

To the Editor: I have a horse that while playing in the lot when a colt fell, turning the hind leg under him in such a way to cause the joint to swell and become inflamed. I treated it with hot applications, liniment, etc., and while it does not lame him it has left a soft ball about the size of an egg on the inside of his leg that appears to be filled with water. What can I do to remove it?—A Reader, Manteca.

[Rub iodine on this enlargement daily for two months. If it becomes very sore discontinue treatment for a time and then begin again.

HORSES CHEW LINES.

To the Editor: I have four head of horses that have all had their teeth floated but chew their lines. I have tried pepper and grease on lines but it did no good. They have plenty of salt. What will break them of this habit?—E. E. R., Lemoore.

[Have short chains attached to the ends of the lines to lengthen them.]

TREATMENT FOR HORSE WITH SORE LEG.

To the Editor: I have a horse whose heel has been sore for several months with what I think is a thrush. Also have a three-year-old horse that has a hard bunch on the hind leg about the size of a walnut, which has been there since the horse was a few months old. It is about six inches above the ankle joint. What can I do for them?—Subscriber, Le Grande.

[Pack the sore place with cerate of cantharides and repeat in four days. Rub tincture of iodine on the enlargement once daily for a considerable period. Stop if it becomes very sore and then begin again.]

SOW WITH PNEUMONIA.

To the Editor: I have a young sow that has a slight cough, runs at the nose, won't eat much, lies down a great deal and tonight seems to have trouble breathing, her breath coming short and quick. She has not eaten much for several days. Is there anything I can do for her?—J. L. C., Turlock.

[This is pneumonia and the animal is prabably dead by now. Clean, warm, dry sleeping quarters, free from drafts, is the best preventive for this trouble.]

LEAKY TEATS AND ABORTION.

To the Editor: I have a heifer that leaks her milk badly. This is the second calf; is there a remedy? Would it be possible for a veterinarian to take the skin from around the opening and sew the muscle together more closely? Have contagious abortion, but while the cows clean up quite easily, my bull has lately gotten infected and seems to be hard to clean up. I run a rubber tube about 8 or 10 inches up the sheath and force a potassium manganate solution through the tube, but he seems to have a sticky discharge from the sheath and when he serves cows some of the semen seems to have yellow spots in it and the cows start discharging again. I think some of the cows are getting with calf and have been douching them with the above solution till discharge ceases. What is the chance of these cows carrying their calves?—Subscriber, Merced.

[A good operator could fix the teats, but there would be danger of mammitis and it would be considered a serious operation. You are using too strong a solution to inject the bull with. Cows usually carry their calves after they have aborted twice.]

Jersey Bulls

EMPRESS LASS, Grand Champion Jersey Cow at Alaska-Yukon Exposition, and several times at California State Fair, gave 82.32 pounds fat during December, 1915, under dairy conditions.

Care of the Brood Mare.

[Written by Henry Wheatley, Napa.]

The care of the brood mare commences whenever she is foaled, that is in the care of the dam; but we will commence with the filly when she is weaned. From this time on the essentials are, good feed and enough of it and plenty of exercise.

The two must go together, for with feed and no exercise the filly will probably go wrong and if not it will not get the muscular development so necessary in a good mare, and if given exercise without liberal feeding the mare will be undersized.

The age at which a mare should be bred is one on which opinions differ, but I think most breeders agree that if the two-year-old mare is to be bred she must have quite liberal feed or she is liable to be stunted.

While the mare is carrying her foal she is better at work than lying idle; but again, a work mare that is in foal requires more feed than a barren, mare and while she is better at work than idle, it is advisable to let the barren mares or the geldings do the very heavy work. If this is done most mares can work right up to foaling time and be better for it.

But after foaling give her a month's rest. After that the mare can resume her work, leaving the foals in a box stall, preferably with the run of a yard, and let them have some bran and oats to eat. At night, after the mare has had her feed, turn her and the foal on grass. In this way the mare can be used and at the same time raise a good colt.

Handled in this manner the brood mares can work for eleven months in the year and also raise a foal. I certainly believe horses raised as above are the cheapest power for the farm.

Rice Middlings for Sows and Pigs.

To the Editor: Will you kindly give me the feed value of rice middlings as compared with wheat middlings for sows and little pigs? Give me your estimate by weight and I can figure the difference in price myself.—E. A. P., Vacaville.

[Answered by Professor F. W. Woll, University Farm, Davis.]

[Rice bran and rice polish are the two common by-products of rice mills, that are used for stock-feeding purposes. It is possible that rice middlings, so-called, is nothing but fine-ground rice bran or a low-grade rice polish. When pure and unadulterated, both these feeds are valuable for swine feeding, rice bran being somewhat less valuable than wheat middlings, and rice polish somewhat more valuable. The polish makes an excellent fattening feed when it makes up not more than one-half of the grain ration, and is one of the richest starchy feeds available. It contains about 8 per cent digestible protein and 74 per cent digestible carbohydrates and fat, against 7.9 per cent and 57.9 per cent for a good grade of rice bran, and 15.7 per cent and 62.5 per cent for wheat middlings. A mixture of rice bran and wheat middlings, equal parts by weight, would give more satisfactory results for feeding sows and little pigs than either of the rice feeds given. Unless a first-class quality of rice middlings were available, it would not be advisable to feed it, even in a mixture with other concentrates. If the bran (middlings) contains more ground hulls than is unavoidable with present methods of milling, it makes a very undesirable and even dangerous feed, especially for little pigs; e. g., the Pacific Rural Press for February 5, 1916, page 162, Rice Hulls Dangerous.]

NOT AFFECTED BY PASTEURIZATION LAW.

To the Editor: I understand that after October 1, cows have to be tested for tuberculosis if one sells his cream to a creamery. If one uses the milk themselves they would not have to test, would they? Does the State send some one around to do it? If not, who does it, and does the owner of the cows have to pay for it, and about what would be the cost of having the testing done? It would seem to me that the State ought to pay at least half of the value of the cow condemned. One might say that it would make butter a little higher in price, thus returning some of the loss, but I can't figure how a man with one or two cows can get enough extra for his butter to repay him for the expense. It would seem to me that, as it is done for the benefit of all milk or butter users, the loss through testing should be stood by all.—E. L. Winton.

[As we have previously stated in these columns, the dairy cow owner who uses his own product exclusively and the one who sells to a creamery or milk distributor will not be affected by this law. We are advised that dairymen selling direct to the retail trade, who do not wish to pasteurize, and who are not in a district where any of the cities maintain inspection, should put in an application to the State Veterinarian, Sacramento. This allows them to continue selling milk till such time as the State Veterinarian or his deputy is able to do the testing. In such instances there is no charge made for the testing. Dairymen in districts where city milk inspection is done by any of the various cities, may have to pay for the testing, providing their inspectors demand testing before the State Veterinarian can get around to do it.

There is undoubtedly much merit in your suggestion as to the State standing a portion of the loss from tuberculosis testing. Such a law has been in effect in Wisconsin for several years and has been a big influence in cleaning up this disease in that State. Such a law has been advocated in this State before, but apparently the demand for it has not as yet become great enough to break into the State Treasury for funds with which to finance it.—Editors.]

HOW MUCH SILAGE FOR 10 COWS?

To the Editor: How large a silo would it take to feed ten cows for five months? About how many acres of good corn would it take to fill a silo of that size?—Subscriber, Tehama County.

[Assuming that you feed 30 pounds of silage per day per head, your 10 cows will require 22½ tons of silage for five months' feeding For such a herd a silo not smaller than 10 feet in diameter and 20 feet high, with a capacity of 26 tons, would serve the purpose. Just what a good crop of corn would be in your section is a question we cannot answer. In general over the State we have always thought 10 tons to be a good average, but this varies with soil and climate. As a rule the largest yields are obtained on river bottom lands, while lighter yields are customary on high dry land where the crop has to be dry farmed. We should plant three or four acres for the size silo above mentioned so as to be sure and have enough silage. Any surplus left after filling the silo can either be fed green to the stock, or left to ripen and harvested for grain in the fall, if your climate allows of that practice.—Editors.]

The Fox Tail in the Alfalfa

makes that first cutting worthless as hay, but it makes

Excellent Silage

when put into an

Ideal Green Feed Silo

and you can harvest it in the rain if necessary

THE SAVING by putting the first cutting of alfalfa into the silo is TWO FOLD.

FIRST YOU MAKE GOOD FEED out of a crop that as hay is not worth handling, besides getting rid of the most of the weed seed.

SECOND BY FEEDING GOOD ENSILAGE you can almost if not altogether cut out the mill feed bill and thus increase your profits.

YOU CAN FILL TWICE A YEAR, in the spring with the first cutting of alfalfa, which will be fed out in time to fill with the corn planted in July.

YOU WOULD HAVE YOUR SILO PAID for now if you had installed it last year. The profit from any one filling being usually enough to do this.

RESOLVE RIGHT NOW to not go through another season without an Ideal Green Feed Silo. We will sell you on terms.

Write for catalog and our special proposition.

A Grandson of Tilly Alcartra.

We have several splendid grandsons of this now famous cow which we can deliver to you at prices which will suit the pocketbooks of every dairyman wishing to improve the quality of his herd, whether it be a grade or pure-bred herd. These bulls are sired by our herd bull, Prince Alcartra Korndyke and out of A. R. O. cows, and are the only living grandsons of a cow having a record of over 30,000 pounds of milk in a year. Such an opportunity for increasing production has never been offered **DAIRYMEN AND BREEDERS** in California, price and quality considered. Buy one of these bulls and solve your low production problem. Write

Poultry Questions Answered.

[By Geo. H. Croley, President Federated Poultry Association of California.]

SETTING TURKEY EGGS.

To the Editor: Please tell me if a turkey hen will lay more than two settings if she is not allowed to set. Have been told by some that they will only lay two settings even if broken from setting, and some say three.—J. W. S., Pond.

[Under favorable conditions vigorous turkey hens will lay three lots or clutches of eggs if the first two are carefully removed, but the last clutch—usually termed the fall laying—seldom produce satisfactory poults. Mrs. Swaysgood in her book, "California Poultry Practice," states: "I have seen turkey hens running around with broods at Christmas, and that as far north as Sonoma county."]

MORE HOGANIZING QUERIES.

To the Editor: Please inform me where I can learn the system of Hoganizing chickens; also who is the publisher and the price of the book?—Mrs. M. S., Stacy, and F. S., Smartsville.

[We answered a similar query in the issue of Jan. 29, 1916, in which we briefly described this system. The book which teaches this method of selecting breeding fowls and laying hens, is entitled the Call of the Hen; it was written by Walter Hogan, who began the study of selection for heavy egg production over forty years ago. Orders may be sent to the Pacific Rural Press. Price $2 postpaid. A new edition of this book, which has just been received, is nicely printed with large type on heavy paper and is handsomely bound. In the back of this edition there appears a list of forty questions for use of the reader in testing his ability to memorize the rules for making the proper selection of fowls for breeding purposes.]

POULTRY NEWS NOTES.

[By Geo. H. Croley.]

A brooder house 180 feet long with a capacity of 7000 chicks is under construction at Brooke Farm near Sacramento. The heating device, designed by Mr. Brooke, consists of a large oil-burning heater with over 700 feet of hot-water pipes. The house is divided into compartments so that not more than 150 chicks will be under one hover.

The Fair Oaks Land Company are installing a poultry ranch on their property adjacent to their ninety-two-acre almond orchard.

Under the local marketing system of the Pomona Valley Producers' Association, a steady and satisfactory price has been maintined during the winter notwithstanding the great advances and declines of egg prices in the large markets of the Coast.

The poultry show held at Victorville, San Bernardino county, during the last week of January was quite a success and, considering the newness of the settlement, was well attended. The fifteen exhibitors displayed a good variety of chickens, turkeys, pigeons, and rabbits. This show was intended to appeal especially to those who must find some means of getting money for the development of their land or of making a living until their trees begin to bear. There is a local market for many more eggs than are now produced in that section.

At the annual meeting of the Tulare Co-operative Poultry Association held on January 31 the lady members of the Association served a chicken pie dinner at noon.

At the annual meeting of the Coalinga Poultry Association, the following officers were elected: President, Jas Hutcheson; vice-president, V. R. Kinder; secretary, Chas. Miller; treasurer, Jas. Tennant; superintendent, Claude Walker; agent, E. J. McCrosky.

POULTRY TICKS SUCCESSFULLY DESTROYED.

To the Editor: In a recent number I saw a request for some way to kill poultry ticks. Having cleaned up a badly infested place and kept it clean for two years, I offer my remedy.

First clean the house thoroughly and burn everything removed; if the stuff won't burn, soak in oil and then burn to kill any eggs or ticks present.

Then paint all woodwork, not covered with tarred paper, with one pint of sheep dip in ten quarts of distillate or coal oil. Be especially careful about the under side of the roosts and dropping board. Repeat in about ten days. Then make a good whitewash and add one quart of crude carbolic acid to twenty of whitewash; cover all woodwork except roosts and top of dropping board with this wash. Paint dropping board and roosts twice a month with a good liquid lice killer and renew whitewash with the acid at least once a year—better twice.

If there are any ticks on the hens during the day, dip them in a solution of one part sheep dip to twenty of warm water, after which they must be dried or protected from the cold.

Buildings very badly infested to the point where the hens are dying had better be burned.

Riverbank. Frances Davis.

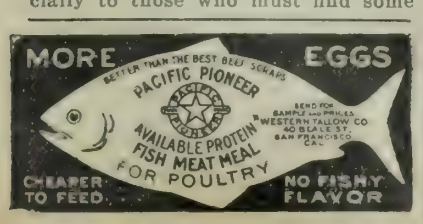
NO CATS NEEDED WITH GOPHER TRAP.

To the Editor: In the issue of January 15 appears an article on Experience in Trapping Gophers, by Mr. Brotherton.

I'm a firm believer in putting the best foot forward — in breeding stock or anything else—even catching gophers, and I'd like to suggest in the columns of your paper that Mr. Brotherton and others do not stop with a good enough trap called the "Macabee" or the like—with the aid of cats—but try a trap designed by my neighbor, Mr. J. Milo Wolfe, for the E. J. Chubbuck Co. of San Francisco.

This trap is called the "Ideal." It is a cylinder-shaped trap that fits into the holes of gophers and when they come out to feed, or carry out the dirt, or even see the trap and try to cover it up by pushing dirt on it, they are caught by claws which are on the end of the trap deepest in the hole.

A gopher cannot get past this trap and there is no missing him if he enters the trap, or just catching the skin as in cases with other traps. It is a sure catch, only when the gopher is so powerful that he can push about a foot of dirt before him, and that seldom happens.



Your readers can find an advertisement of this trap in your paper and I am sure E. J. Chubbuck Co. will furnish all with literature describing this trap.

I have used this trap with remarkable success and I don't need the assistance of cats to get the gopher, and I would like to have Mr. Brotherton, especially, try one of these traps for he says, "It's a sure catch if set right." The "Ideal" is sure if set.

Stockton. J. E. Thorpe.

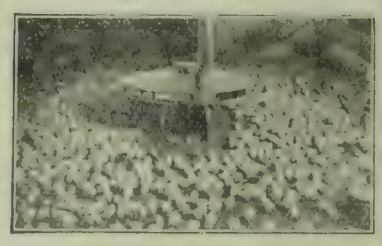
It has been found best to prune peaches and apricots right after the fruit is off in the Beaumont district, and then thin out excess brush in winter, but not cut back the new wood part way, as this induces too much waste wood growth.

Earl Henkings of Imperial county is erecting new quarters for his pure-bred herd of Duroc Jersey hogs.

Send For A Sample Of Calmade Graduated Poultry Fence

10 inches graduated in mesh from ½ inch to 1⅝ inches then 20 inches of 2¾ inch mesh, topped by 4½ inch mesh for the height of the fence.

The Fence Without a Sky Line



It is the most economical as well as the most practical of all poultry fences. It costs no more to buy than the old style poultry netting and costs much less to put up.

It is the only fence made with a bottom mesh smaller than one inch. It will turn the smallest chickens. Because of the straight line, continuous weave of "CALMADE GRADUATED" Fence, baby chicks won't hang in it, large fowls can't climb it.

"CALMADE GRADUATED" Fence will not slip at the joints nor unravel when cut. Uniform in weave and width. It unrolls flat as a board—it is easily put up and stretches without bulge, kink or bend on posts 16 feet apart. Learn all about these advantages and let your next fence be a "CALMADE GRADUATED." Write at once for free samples of wire used, free illustrated folder and name of nearest dealer.

Farm Poultry for Profit.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

RAISING THE POULTS.

There are very few people who can raise turkeys with any measure of success in spite of the strenuous efforts they make. The reason for this is mainly because they fuss too much, feed too much and coddle too much. A turkey needs none of these things. What it needs and pines for is freedom, just to be left alone with Nature.

It is necessary to keep them in out of the rain and dew till the poults get strong, but they should not be driven around nor handled every time the feeder feels like it, neither should they be kept in hot, stifling brooders.

Give plenty of fresh air and moderate warmth, together with food that comes as close to Nature as you can get and there is no reason why you can't raise a fair proportion of either hen-hatched or incubator-hatched poults.

What to Feed.—This is the rock over which many stumble—what to feed and how to feed it. In the first place let the feed be soft and easy to digest. A bread made of one part middlings, one part corn meal, one part rolled or steel cut oats and one part fine flour, a little salt and a teaspoonful of red pepper mixed into a batter or dough with skim milk, then baked in a very moderate oven for two days, is very good.

Let the bread be baked several days before the chicks or poults hatch, then put it through a meat chopper or soak in skim milk, squeezing out the extra milk and feed a little every two hours the first few days.

This bread costs but little and is equal to Spratt's. If you don't want to go to the trouble of baking, better let turkeys alone. In addition to the bread, feed hard-boiled eggs, chopped fine with onion tops or fresh lettuce and a little rolled oats. Feed mash moistened with skim milk and a little charcoal, grit, etc., but don't feed hard grain.

It is feeding chick feed and all kinds of grain feed that causes indigestion in turkeys. The droppings get loose and yellow and then people think they have "black head." Give proper feed that the poults can digest and you will have no indigestion; feed grain and your troubles begin right away.

Let the poults have all the green feed they can eat, or sprouted oats if no other can be had, and as much freedom as is consistent. A little red pepper stimulates the digestive tract. It is not properly speaking a food, but a corminative, and is slightly stimulating in small doses; in large doses it would be harmful, so don't overdo it.

Keep the poults away from chickens, then they will not have many lice. But if they do get them be sure to get the dust box to work, for lice mean death to young turks.

GYPSUM FOR DROPPING BOARDS —BITTER KALE.

To the Editor: Is there any objection to using air-slacked lime on the dropping board after cleaning? It keeps them dryer and prevents bad odors. In the fall, kale that is not irrigated gets stale and bitter and fowls do not like it as well as corn stalks cut fine in the cutter; but some poultry keepers here think the corn decreased the egg yield. Can you give me some advice?—C. E. B., Petaluma.

[If the poultry manure is to be used as fertilizer, lime will drive out the nitrogen, thus destroying much of its value. We suggest the substitution of gypsum (land-plaster) for lime. It acts as a dryer and absorbs odors, besides indirectly it adds to the value of the fertilizer in nearly every instance. Green corn stalks are excellent green feed for fowls and usually should help to increase egg production. They run greatly to starch and sugar, and for that reason they will still further widen an already over-heating ration and thus bring about a decrease in egg production, while on the other hand if the hens are a little under condition because of a two narrow ration the cut stalks will bring them up rapidly and help to increase the egg yield. We have had no experience with bitter kale and can only guess at what might be the cause. A neighbor has raised more than an acre of giant kale each year for a number of seasons, without irrigation, and has not experienced this trouble. It may be due to some local peculiarity of the soil such as excessive subdrainage or to a hardpan that prevents the tap roots reaching a water supply. Can any reader who may have had similar trouble suggest a remedy?]

MISCELLANEOUS.

Dr. Griffith of Kings county reports that there is more livestock than usual there at this time but that there has been no scarcity of feed and very little disease, during the past month.

Those in charge of the Butte County Spring Exposition are planning on making the livestock show one of the features. It would seem as if there was room for a good livestock show in that end of the Sacramento valley at this time.

Members of the Napa County Livestock Ass'n held a meeting at St. Helena last week at which time a committee was apopinted to draft an ordinance providing for the protection of live stock in Napa county against contagious diseases which might be disseminated by indiscriminate shipping; another on coyote control, and a third to arrange for an exhibit at the next county fair.

The Home Circle Page of the Pacific Rural Press

TISSUE PAPER ROPE ART.

Imagine ninety women of all years and conditions seated at long tables in a department store, fashioning things of long, vari-colored strands of thick cord, almost too absorbed to cease for luncheon. Imagine cries of delight as this one gives shape to a hanging basket and that one to a lamp cover, or the exclamations of petulance as one discovers that she has made a mistake in the weaving and must undo half that she has wrought. Imagine with it all a certain atmosphere of fascination.

Do so, and you have an idea of a public demonstration of the tissue paper rope art work. It is a late fad that has struck the Pacific coast with extreme fervor.

The task entailed is much like basket weaving. The thick but light cord is made of tissue paper. It is braided into ornamental devices and then shellaced to make it waterproof and to enhance its appearance. The work is very simple but there is a knack about it that had best be learned from an instructor. The firm that manufactures the cord provides the instructors, one to each table. Needed are wire cutting pliers, paste and a supply of fairly stiff iron wire, tissue paper and the cord. The wires, to form the ribs of whatever is being fashioned, are first covered with tissue paper of the shade of the cord to be used, the paper being gummed onto the wire as it is twisted. Then these wires are cut into lengths suitable for the ribs of an article of the design chosen, and the weaving begins. The article is shaped by bending and the addition of more wires or the removal of some of them as the work progresses. Some very tasteful and quite often useful things can be made. The work is well adapted to invalids and the blind, a blind girl being one of the most successful and enthusiastic pupils at a recent demonstration.

The total cost of articles that can be made with this cord runs from fifty cents to $10, according to the nature of the article and the accessories needed. For instance, a cover for a parlor lamp on a tall stand needs the purchase of a plain lamp of that kind to be covered with the cord. But hanging baskets for flowers require little but the cord and a taste for the art.

SEWING LIKE DRAWING.

To cook a stew or to cut and sew a dress have a psychological value in the education of a young person, according to Mrs. Dona De Luce. It is not alone the practical knowledge gained that is of worth, according to this sewing instructor in the Berkeley High School, but there is also the spur to initiative given by the study of cooking or sewing. In a recent address she compared such study to the study of drawing as far as inspiration is concerned.

"This work is creative," she said, "and mistakes when made are soon and easily seen." In such studies she found therefore a great aid to the development of character through a properly guided will.

THE FIVE LITTLE FOX TERRIERS.

(Posed by little May Boesch of Glen Ellen, Cal., feeding her pets.)

Five little fox terriers hungry for more; one really got enough and that left four.
Four little fox terriers busy at their tea; one stopped to pick his teeth and that left three.
Three little fox terriers with an appetite for stew; one had to scratch himself, and that left two.
Two little fox terriers who've "only just begun"—one found he'd dined before and that left one.
One little fox terrier seemed never to get done, until he got the hiccoughs, and that left none.

COOK PORK WELL.

Pork, more than any other meat, should be cooked thoroughly before eaten. This is as a protection from trichinosis, which is communicated to mankind only through raw or rare pork. Trichinosis is a disease of the hog and is sometimes fatal. The hog becomes infested with trichina, microscopic worms. The federal inspection of livestock has developed that about one hog out of seventy-one suffers from it.

The one thing trichina can not stand is heat. A temperature of 140 degrees throughout will kill them if present and not impair the food value of the meat. A lower degree of heat for a very much longer time will also kill them, but the safe rule is not to eat pork in any form until it has been cooked. so that no part of it looks red.

A RHYMED RECIPE.

Here is a part of an old favorite corn bread recipe in rhyme, as it appeared in a cook book of the last decade:

Two cups of Indian, one of wheat;
One cup sour milk, one cup sweet;
One good egg that well you beat;
Half a cup molasses, too;
Half cup sugar add thereto;
With one spoon of butter new;
Salt and soda each a spoon;
Mix up quickly and bake it soon;
Then you'll have corn bread complete;
Best of all corn bread you'll meet.

EXPERIENCE EXCHANGE.

N. H. B., of Lodi, Cal., sends a plan of his kitchen that has proven the most convenient he has ever tried. The outstanding feature is that three sides of the room are lined with cupboards and closets; and starting both ways from the range is an ingenious continuation of the drain board along most of the walls as a handy aid to work.

We have to thank a reader, M. A., for the following recipe for a mulligan stew: 2 lbs. round steak, 2 good-sized onions, 4 medium potatoes, 1 pint canned tomatoes, 1 chili pepper, two or three celery stalks, and a few carrots or turnips if liked; salt to taste. The meat and vegetables are cut into small pieces. The meat is floured and browned in butter in a granite or aluminum kettle. Then pour boiling water over the meat slowly until well covered, and let it boil one-half hour. Then add vegetables, etc., and cook slowly until done, about one hour. The reader recommends round steak as most economical, and advises boiled rice as a side dish.

THIS WEEK'S BEST HOUSE-HELP.

To have an attractive suit for a boy under 6—buy navy blue serge and make him knee pants and a Russian blouse. He will be fixed until it is time to get him into store clothes.

SPANISH CREAM, A DELIGHTFUL DESSERT.

(This Week's Preferred Recipe.)

This is a kind of custard stiffened with gelatine, to be served cold. It requires 3 eggs, 3 cups milk, 1 tablesp. gelatine, ½ cup sugar. The gelatine is soaked for 15 minutes in a half cup of milk. The remaining milk is heated to the boiling point and the gelatine added and stirred until dissolved. The yokes of the eggs are beaten, and the hot milk gradually poured over them as they are being beaten until all the milk has been absorbed. This is put on the fire, preferably in a double boiler, until it thickens, stirring all the while. Stiffly whipped whites of the eggs are then stirred in, along with 1 teasp. vanilla flavor and a pinch of salt. The mixture is then poured into individual cups or molds and set away to cool. If the molds are wetted in cold water before filling, the cream may be turned out of the molds after it hardens.

MRS. BEST'S BULLETIN.

My Dear Friends:

I saw a throng of women in front of a show window, and joined the group expecting to see something extremely novel and thrilling from the fashion centers. But I was a little disappointed at finding only a display of marked-down costumes at clearance prices. My feelings reminded me of the little boy who was called posthaste to see the baby of the family which had just cut a new tooth. After inspecting it a moment Bobby turned away downcast, and said:

"Huh! From all the fuss you made over it, I thought it must be a gold tooth!"

However, scores and scores of women made "gold teeth" out of the January clearance sales, and picked up some wonderful bargains not alone in cloaks and suits, but in fabrics and all sorts of household necessities. For one who has money reserved for such a chance, last month, and even this month, came as a profitable feast.

The novelties are coming out, though. Saw a magenta-and-black checked walking suit with tan leather collar and cuffs. A black and white checked suit had white kid collars and cuffs. As I stated some time ago, the black and white check promises to be popular. The stores are showing cloth in that pattern in bolts for suitings, which proves that a great deal of confidence is felt in its popularity.

I hear, and I believe, that black silk for dresses will be very much favored. Black silk, however, is ALWAYS in the best of taste. Some ready-made designs are already appearing.

There was almost a riot of inquisitiveness in one store over a striking display of Milanese sport color silks at $2.50 a yard. The colors, with their exceedingly Frenchy names, are several shades removed from any familiar colors. Every woman paused to fondle the goods, and to admire or criticise. The whole display was made effective by draping the half dozen or so shades alongside of each other. One peculiar thing about them was that none of them seemed to clash with any of the others.

Japanese crepe paper Valentine lunch sets I saw at 50 cents, including a lunch cloth, 1 dozen decorated paper plates, 1 dozen doilies and 1 dozen napkins. A large cloth by itself I saw at 15 cents. Then there was a set of 2 dozen doilies at 10 cents. Plates separately could be bought at 35 cents a set in an elaborate finish.

There was some 27-inch velvet corduroy in the newest spring shades selling at 88 cents a yard.

A new bath room rug, 3x6, was in solid tints, woven in rag carpet fashion with bars of big white and black checks smothered in a vari-colored flower design. This was $4.75.

And then there was—but the other things I will leave until next week.

Devotedly, **Rosabella Best.**

(Note—Readers wishing information from Mrs Best, care of the Rural Press, will receive a reply if they enclose a stamped addressed envelope.)

FIRST DROPS OF RAIN.

By Sunbonnet Sue.

There is one delight none can deny me.

It is to listen to the first drops of rain.

The rain comes ever so softly. It seems to come as by stealth. Most often its coming is shyly by night.

It does not come brusquely, the rain. Its approach is not swift. The winds and the clouds are lingering heralds of its coming.

I speak of the gentle rain that I await like a friend, the rain that returns after a season of drouth, like an old friend to see if I'm angry.

Scenting the fresh incense of its coming, I await it. I may sleep, but 'tis the light sleep of the listener. For it steals up with the velvet tread of the mist. It may be already here though lost in the hush.

For such is the diffidence of my long absent rain that it seems to tremble ere it grows bolder. It does not awake me until the drops have fallen for minutes, and the roof is agleam with its moisture.

And then the long tin spout from the eaves rings once—PLING! 'Tis the very first drop that has rolled from the roof. Then PLING! again. I am fully awake.

'Tis as if the rain roguishly tinkled a little bell and drew its shy finger away; and then more confidently rang it again.

Now the tin spout goes ringing more gaily—P L I N G!-P L I N G!-PLING!-ING-ING-ING! It mounts to a drone as the roof sheds its burden of moisture to roll down the spout in a smooth stream without echoes. And the rain romps all about until the gutters go brimming with grateful applause.

"Bless you, good old rain!" say I and drop back on my pillow to sleep the more soundly.

For my soul has been soothed by greeting the first drops of the rain.

ALFONSO'S SILENCER.

Few of those who recently read in the papers that King Alfonso of Spain had celebrated his twenty-ninth birthday remembered that this young monarch has reigned longer than any other European sovereign except the King of Montenegro and the Emperor of Austria. Alfonso was born a king, and has reigned all the twenty-nine years of his life. Pearson's Weekly tells an amusing story of a visit he once paid, when he was little more than a boy, to a small Spanish town that is noted for a certain delicious kind of candy that is as sticky as it is palatable.

When the young King arrived, a deputation of the townsfolk waited on him and presented him with a huge box of the famous candy. At the same time a pompous man stepped forward with a large roll of paper in his hand, which he began to open. It was a loyal address, and evidently a very long one.

Now, King Alfonso loathes listening to addresses, so as the big man advanced, he handed round the box of candy among the deputation and made the would-be reader take a particularly large piece. Of course etiquette forbade him to refuse. As he worked his jaws up and down, his teeth stuck in the candy, and he could no more have read the address than he could have flown into the air!

BOYS OF BOSTON COMMON.

In the days of the American Revolution none of the colonists were more patriotic to their new land or more proud of their quest for liberty than those living in Boston. But in consequence of this they suffered most at the hands of the British soldiers. Even the children were mistreated by the Red Coats, and could not have their usual freedom, although they could not harm the king or his army.

The boys of Boston were fired with the spirit of their fathers. General Gage was the commander of the military forces of New England, and his headquarters were at Boston. During the winter, when the common was a camp, the British soldiers destroyed the boys' coasting grounds. The larger boys called a meeting and resolved to wait upon General Haldimand, General Gage's subordinate, and report to him the conduct of the soldiers.

When they presented themselves before him he asked with surprise:

"Why have you come to me?"

"We have come, sir," said the leader, "to ask punishment of those who wrong us."

"Why, my boy, have your fathers made rebels of you and sent you here to talk rebellion?"

"Nobody sent us, sir; we have never insulted your soldiers, but they have spoiled our skating ground, and trodden down our snow hills. We complained; they laughed at us; we told the captain; he sent us away. Yesterday our works were again destroyed. We can bear it no longer."

"Good heavens!" said General Gage, on hearing the story; "the very children draw in the love of freedom with the air they breathe!"

Turning to the boys he said:

"You may go; if any of my soldiers disturb you in the future they shall be punished."

Evidently.—A man traveling in Maine met a middle-aged farmer, who said his father, ninety years old, was still on the farm where he was born. "Ninety years old, eh?" "Yep, Pop is close to ninety." "Is his health good?" "Taint much now. He's been complain' for a few months back." "What's the matter with him?" "I dunno, sometimes I think farmin' don't agree with him."

Safer Not.—"I want to see your beauty editor," said the caller at the sanctum of a popular magazine.

"Are you following her advice?"

"I am."

"Got confidence in it?"

"I have."

"Then you don't want to see her."—Louisville Courier-Journal.

Super Patriot.—"Would you go to war for your country?"

"Would I go to war for my country? I'd do more than that. I'd lick any man that tried to get my country into a war."—Detroit Free Press.

Urgent. — The Doctor — "Mrs. Brown has sent for me to go and see her boy, and I must go at once." His Wife—"What is the matter with the boy?" The Doctor—"I do not know, but Mrs. Brown has a book on what to do before the doctor comes, and I must hurry up before she does it."

Figures given are Independent and Reliable.

Pacific Rural Press Market Report

Prices quoted as paid to producers.

San Francisco, Feb. 16, 1916.

WHEAT.

The local market is steady and without much feature, the principal demand being for lower grades for feed, as the milling interests have made fairly good provisions for their requirements. The Eastern market shows some fluctuation on export conditions, but no definite new tendency has developed.

Cal. Club, ctl.	$1.80 @1.85
Northern Bluestem	1.97½ @2.02½
Northern Club	1.85 @1.87½
Northern Red	1.85 @2.05

BARLEY.

The speculative market is rather weak with little demand and spot feed is a little lower in sympathy, buyers being disposed to hold off. There is enough shipping inquiry, however, to hold the top grade steady.

Shipping, ctl.	$1.40@1.45
Choice Feed, ctl.	1.35@1.37½

OATS.

No further change is noted, the local demand being limited, with ample supplies for all nearby needs, while conditions in the north do not show any great strength.

Red Feed	$1.35@1.37½
Red Seed	1.45@1.65
White	1.50@1.55

CORN.

All grades are steady as before. Egyptians, kaffir, etc., are offered but are in good demand and attractive lots find ready sale. There is a good deal, however, that is in poor shape and will not bring full values.

Eastern yellow, ctl.	$1.80@1.85
Milo Maize	1.40@1.45
Kaffir	1.65@1.70
Egyptian	1.50@1.55

BEANS.

Prices continue on the down-grade, though there has been no very sharp drop in any line. Buyers have been taking very little interest since the holidays, and a good many holders are getting anxious to clean up, causing occasional slight reductions on the various kinds, though in a general way the market is fairly steady. The top figure on limas is a little lower this week, and small whites, which were extremely firm for a time, are now easing off, bayos also showing a slight decline. This appearance of easiness does not encourage buyers to get into the market, but the movement is sure to increase as stocks in consuming markets are reduced.

(On wharf, San Francisco.)

Bayos, per ctl.	$4.80@4.90
Blackeyes	3.50@3.60
Cranberry Beans	4.75@4.85
Horse Beans	3.25@3.50
Small Whites (south)	5.50@5.60
Large Whites	5.75@5.90
Pinks	4.30@4.40
Limas (south)	4.50@4.55
Red Kidney	6.50@6.75
Mexican Reds	4.50@4.65
Tepary Beans	4.00

SEEDS.

Alfalfa is getting a little more attention, as conditions are getting more favorable for spring planting, but the other lines quoted are quiet. The general trade in garden seeds is very active.

Alfalfa, per lb.	.19 @20 c
Melilotus Alba	6 c
Melilotus Indica	6 c
Bur Clover	11 c
Oregon Vetch	4¼ @ 4½c
Soy Beans	6 c
Canada Peas	5¼ @ 6 c
Sudan Grass	40 c

HAY.

Hay has been moving a little more freely for the last week, as traffic has been less interrupted by weather conditions, while the demand continues strong in many quarters The local demand is picking up a little, and considerable feeding is still necessary around the country, though with fair weather this demand will diminish from now on. Shipments to nearby states are also heavy, and the stock remaining at either storage or producing points has been greatly reduced Prices are accordingly very firmly held, with some prospect of further advance before new hay comes into the market.

No. 1 Wheat	$13.00@15.00
No. 2	11.00@13.00
Tame Oats	11.00@16.50
Wild Oats	12.00@14.00
Alfalfa	13.00@16.50
Stock Hay	10.00@12.00
Straw, per bale	.25@ .40

FEEDSTUFFS.

All descriptions are firm, under an active demand from all parts of the country, but values show no further change this week.

(Wholesale prices per ton, carload lots, San Francisco.)

Beet Pulp, per ton	$22.50@23.00
Alfalfa Meal, per ton.	20.00@21.00
Alfalfa Molasses Meal per ton	21.00@22.00
Bran, per ton	26.50@27.50
Oil Cake	Nominal
Cocoanut Cake or Meal	23.00@25.00
Cracked Corn	39.50@40.50
Middlings	33.00@34.00
Rolled Barley	29.00@30.00
Tankage	45.00
Rolled Oats	29.50@31.00

VEGETABLES.

The sudden arrival of spring weather has brought in the first asparagus of the season, which sells at a rather wide range of prices, according to quality. Offerings have been light so far, but are expected to increase rapidly, as the plants, held back by the long spell of cold, are making rapid growth. Other vegetables are easing off a little, though arrivals in many lines are still light, and some, such as tomatoes and eggplant, are coming from Mexico and Cuba. Rhubarb is somewhat easier, with liberal supplies. String beans are coming in again, while peas are high. Celery is lower, and still tends downward, as the supply is increasing. A good deal of very poor stock in various lines is appearing, and sells at low and irregular prices.

Cabbage, ctl.	50@60 c
Cauliflower, doz.	50@75 c
Sprouts, lb	5½ @6½c
String Beans	10@15 c
Peppers, bell, lb.	15@25 c
Rhubarb, box	1.00@2.00
Peas, southern, lb.	10@12 c
Tomatoes, L. A., crate	1.75@2.00
Eggplant, lb	20@25 c
Celery, crate	3.00@4.00
Artichokes, doz.	.65@1.00
Lettuce, small, crate	1.00@1.50
Asparagus, lb.	12½ @40 c

POTATOES AND ONIONS.

There is no quotable change in prices, except that there are a good many low-grade onions offered at 50 to 75c. per sack. Good stock is scarce and high, the demand being met largely with Oregon and Bermuda stock. Potatoes are very firm, and growers look for considerable loss to stock still in the ground from the long rain.

(On Wharf.)

Oregon Burbanks	$1.60@2.00
Salinas Burbanks	2.00@2.15
Delta Burbanks	1.10@1.65
Sweet Potatoes, ctl.	2.25@2.50
Onions, Delta, ctl.	1.85@2.25
Oregon	2.00@2.50
River Bermudas, crate	2.00@2.15
Garlic, per lb.	10@12½c

POULTRY.

Good young chickens are rather scarce at present, and as there is a good demand locally, prices are quite firm, broilers in particular bringing stiff prices. Old stock is easy, as there is quite a bit coming from the East, and hens are lower. Turkeys are lower, with little demand and most offerings unattractive.

Turkeys, dressed	25@27c
Live Turkeys, lb.	22@23c
Broilers, 15 lbs. to doz. and less, lb.	38@40c
do, over 15 lbs. to doz.	30@35c
Fryers	24@26c
Hens, extra, per lb.	17@18c
Small	17@18c
Smooth Young Roosters, per lb.	20@21c
Squabs, per doz.	2.00@4.00
Geese, per pair	2.25@3.00
Ducks, young, lb.	18@19c
Old	14@15c
Belgian Hares	9@11c

BUTTER.

Prices have not changed for the last week, the general range being a little higher than before, and considerably above last year's level. The tone is quite firm, as there is not much coming in, and some is being taken for outside markets.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extras	32	32	—	32	32	32
Prime Firsts	29½	29½	—	30	30	30½
Firsts	28½	28½	—	29	29	29

EGGS.

Cold weather in the north has caused a strong demand in that quarter, and heavy shipments were made from this market Saturday, on account of which an advance was expected. Production in California, however, increased enormously in a few days, and the price has dropped to the usual low level of this season. The northern demand is dropping off now, and the market shows very little strength.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extras	26½	23	—	23	22	21½
Sel. Pullets	25	22	—	22	21	20½

CHEESE.

Arrivals of all descriptions continue rather light, and with a fair demand values are firmly held. Monterey cheese holds up to the former high price, and both Y. A.'s and flats are higher.

Y. A.'s, fancy	18 c
Fancy Calif. flats, per lb.	17½c
Monterey Cheese	18@19c

LOS ANGELES DAIRY PRICES.

	Wed.	Thu.	Fri.	Sat.	Mon.	Tu.
Butter	34	33½	34	32	32	32
Eggs	29	29	25	25	24	21

DECIDUOUS FRUITS.

Apples have been moving off in good shape for the last few days, both locally and for shipment to interior points. The supply in storage is getting down to comfortable proportions, and prices in some lines have been marked up a little. A few boxes of pears are offered from cold storage, but not enough to be worth quoting.

Apples:

Pearmain	.85@1.25
Baldwin	.75@1.25
Oregon Spitzenbergs	1.50@2.50
Jonathan	1.25@1.75

DRIED FRUITS.

Local packers still report nothing doing in dried fruits, giving as the principal reason that there is nothing of any consequence left here. Interest at the buying end, however, is still very light. The larger packers do not appear to be taking any interest in the small lots that now constitute most of the country offerings, and it is difficult to place such lots to advantage, especially if there is a desire to realize on them quickly. There are occasional inquiries, however, and it should be possible to clean up everything at good prices. Prunes are in more demand than anything else in the East, as a good many shipments are going to Europe; and there is also a good shipping business in raisins. A slight concessionary feeling has been noted among some holders of prunes, of which buyers are naturally taking full advantage. Peaches so far receive hardly any attention, and apricots are little more than nominal. The New York Journal of Commerce says

"California Prunes for future shipment from the Coast continue to be ruled by an irregular feeling and easier tendencies appears to be developing in some quarters. Quotations however, show no material change. The weakening tendency is attributed by New York brokers to the fact that some of the smaller Coast operators are finding themselves forced to sell limited stocks to meet financial obligations, and in order to attract a demand are offering small supplies at low prices. From advices received by New York operators the statistical position occupied by the 1915 crop Californias is very strong and with the first signs of an increased demand prices are expected to advance.

"Exports continue to be made for Europe almost daily. The shipments are going forward to France and England principally. Shipments for one day last week consisted of 153,600 pounds for England alone.

"California Raisins are held firmly. Stocks are only available in moderate quantity, and, with a fair demand in progress and a good inquiry said to be in evidence both from buyers in the local trade and from foreign sources, holders are maintaining prices on a firm basis.

"Large packers of California Figs

WOOL SELLING AT HIGH PRICES.

There is decided activity in wool circles, both in California and Nevada. At least two large spring clips were contracted for in Nevada during the week, one at 21 cents and another at 21⅛ cents, and 4500 pelts were contracted for in the Bakersfield district at 21 cents. Whether these prices will be maintained later in the season, remains to be seen, but they will at least curtail selling at a lower figure for the present, or till such time as buyers can better size up the market situation. The general prosperity all over the country is keeping all of the textile mills of the East busy which, together with the European orders, has caused a strong feeling in all quarters. The Australian market is high and is expected to go higher and there is a possibility of dollar wool during the year. The old crop is about cleaned up, and there is not much doing in that respect.

Special Live Stock Market Report.

Live cattle prices have been marked up some this week, Nevada offerings being light as the hay shortage there has forced most holders to market earlier than usual, and with the exception of those held by packers there is practically nothing left. All of the feed lots will be cleaned out by the middle of March.

The change of weather has started feed in good shape and some grass cattle are expected by April I. The dressed beef market is firmer on choice light cattle.

The sheep market is somewhat stronger, supplies being almost exclusively from Nevada and Idaho. The situation here as regards wethers has not changed and no spring lambs have arrived as yet.

The hog market is still stronger and good grain fed stock will probably bring a trifle over our quotation. The situation is getting to a point where there is very little profit in hogs from a buyer's standpoint, but the keen demand will sustain the present quotations and may even cause some advance. Fresh pork consumption has naturally been curtailed with the rise in price, but the feeling is strong nevertheless. Growers are getting a little better than 6½ cents net and we look to see confidence restored among farmers as a result of this factor.

report that prices for all times have been temporarily withdrawn. Stocks are very light both on the Coast and on spot, with a moderate demand in progress.

"California Peaches and Apricots were extremely dull, practically no business being done in either line."

Apples	6 @6½c
Apricots, per lb.	9 @12 c

Imperial Clusters, 6-crown, 20-lb. box	2.50
Bulk, layers, 50-lb. box	2.75

CITRUS FRUITS.

Grapefruit shows a considerably wider range on the San Francisco market as the offerings from different sections show considerable variation in quality. Lemonettes are slightly easier. Oranges and grapefruit are moving well locally, but the situation presents nothing of special interest.

The intense cold prevailing in the East together with the heavy shipments of oranges from California during the past few weeks have caused lower prices on the eastern auctions. At New York on Monday, Feb. 14th, navel oranges averaged from $1.80 to $2.70 per box, and lemons averaged from $2.40 to $3.50. At Chicago the same day, oranges averaged from $2.50 to $3.50, and lemons $3.75 to $4.25 per box.

Shipments from southern California last week were very heavy, averaging nearly 300 cars daily. Total shipments from that section for the season to Feb. 14th, were 6,128 cars of oranges and 1,573 cars of lemons; as against 5,489 cars of oranges and 938 of lemons to same date last year.

(Wholesale prices, San Francisco.)

Oranges, Navels	$1.50@2.75
Tangerines	1.50@2.00
Grapefruit	1.25@2.50
Lemons, box	1.75@3.00
Lemonettes, box	1.25@1.75

HONEY.

Values are quite steadily held, as stocks in the retail trade are getting pretty well cleaned up, and there is not much coming in. Anything of attractive quality should find fairly ready sale at the range quoted.

Water White, comb	13@15 c
Amber	8@12 c
Water White, extracted	7@ 8 c
Light Amber	3@ 4 c
Dark	2@ 2½c

NUTS.

Values are almost entirely nominal for California nuts. There are still a few offerings of almonds, but they are closely held, and are expected to clean up in the near future, the Exchange having been sold out for some time. Walnuts also are very closely sold out, and the trade is now running mainly on Manchurian nuts.

(Prices f. o. b. San Francisco.)

LIVE STOCK.

Lambs are coming in a little more freely from various directions, but prices so far are pretty well maintained. The only quotable change in the last week was a slight advance on light dressed steers; but live cattle are fairly firm, with no great pressure to sell. Hogs are still coming in rather slowly, and packers are taking all the good, heavy stock they can get at the figures.

(Prices paid for stock, live weight, off cars, without feed or water, at Stock Yards, S. F.)

Steers, No. 1	7 @7¼c

HOPS.

The slight activity of a fortnight ago seems to have subsided, with no marked change in prices, the market being fairly steady.

HORSES.

No offerings of special interest have appeared in this market for the last fortnight, but it is understood that a number of local buyers are looking around the country for good stock. Good, sound drafters and chunks are in considerably demand here, and there is some call for stock as light as 1200 pounds, though anything much lighter is hard to sell. Values remain at the old range.

(Approximate values at San Francisco, based on auction sales.)

Drafters, 1700 lbs. and up	$250@300
Drafters, 1550 to 1650	150@225
Chunks, 1350 to 1500 lbs.	150@175
Wagon horses, 1050 to 1350 lbs.	110@150
Green Mountain range horses, 950 to 1200 lbs.	20@ 75
Farm Workers	50@100

Publisher's Department

Volume III of "Etcheverry's Irrigation Practice and Engineering," has just been received. This book is the third of a set written by Prof. Etcheverry of the University of California and published by McGraw-Hill Company, 239 West 39th St., New York. It contains 431 pages and over 200 illustrations, covering fully the building of diversion works, canals, laterals, siphons, flumes, gates and distribution systems. Price $4 net.

A very handsome booklet has just been issued by the Department of Horticulture, University of Illinois, entitled "Prairie Spirit in Landscape Gardening," written by Wm. Miller. It sells for 25c. per copy and to any farm owner who wishes to learn about landscape gardening for the country, it will be invaluable.

A very heavy demand from the trade developed this week for our new book "2d Thousand Answered Questions in California Agriculture." We feel confident that this new book will create for itself a heavy sale as it becomes better known.

The weather for the past week has been fine for all kinds of farm activities. Tree planters have made the nurserymen feel fine through heavy orders. It looks now as though many more large plantings will be made than thought possible early in the season. Almond stock is running short and there are heavy demands for prunes and pears.

TRACTOR ADVERTISING THAT PULLS.

Pacific Rural Press: We have been using your advertising columns quite extensively in the last few months, advertising the Ideal Farm Tractor, and thought no doubt it would interest you to learn what results we have been obtaining from your advertising columns. From one issue of your paper in which we had an advertisement we counted over sixty inquiries, and they have been coming into the office in a steady stream ever since.

It is certainly very gratifying to us to know that there is a rural paper that is so widely read and which reaches so many ranchers throughout the state of California. A large majority of the inquiries we have received have been from the State, but we have also received replies from our advertisements in your paper from Honolulu, and from the states of Washington, Oregon and Arizona, and from several of the middle western states.

Pacific Metal Products Company.
Los Angeles, Jan. 26, 1916.

C. W. Hahn of Florida has just shipped the fifth car of cactus slabs from the Timm ranch at Dixon. Mr. Hahn states that cactus does equally as well in Florida as in California and does not have to compete in popularity with alfalfa.

Classified Advertisements.

MISCELLANEOUS.

SUDAN GRASS SEED for sale by the rower, direct to farmer at a saving of 60 per cent—less than Seed dealer's prices! Choice seeds; none better. Send in your orders now while it lasts. Greatest forage crop known for dry or irrigated land. Better and finer hay than Timothy. **Wm. P. Spalding, R. F. D., No. 1, Box 64, Los Molinos, Cal.** 30c. lb. small lots; 50 lbs. and over at 25c, delivered.

SAVE MONEY ON YOUR PUMPING PLANT—We are reducing our stock of Gas Engines, Oil Engines, Centrifugal Pumps, Friction Clutch Pulleys, etc., and can name you very low prices indeed. Write us at once. Commercial Iron Works, 481-497 Fifth St., San Francisco, Cal.

MOGUL TRACTOR, 45 H. P.; used one season; fine condition; will demonstrate; have no use for it; will sell for half cost and give terms, or exchange for horses or mules Drills, discs and other farm machinery for sale. Address W. H. Hord, 704 Market St., S. F

EVERY SIZE WROUGHT IRON WATER PIPE and screw casing water pipe, guaranteed as good as new. Prices right. Send for catalogue. We beat no one; everybody gets a SQUARE DEAL. Weissbaum Pipe Works, 160 Eleventh Street, San Francisco.

SECOND-HAND WATER PIPE and Screw Casing. New threads and couplings dipped in hot asphaltum. All guaranteed. Send us your inquiry. SHECTER PIPE WORKS, 306-8 Howard St., San Francisco.

"SMITHS' PAYS THE FREIGHT."—To reduce the high cost of living, send for our Wholesale to Consumer Catalog. SMITHS' CASH STORE, 106 Clay St., San Francisco.

BUY ROASTED COFFEE WHOLESALE—Best, 10 pounds $3.00 delivered. Order with remittance, WM. J. SCHROTH CO., 112-B Market St., San Francisco.

LIVING EXPENSES REDUCED THROUGH CO-OPERATIVE BUYING—Write for catalogue and particulars. Pacific Co-operative League, D236 Commercial St., S. F.

APPLES!—Buy direct from producer. Newtowns, 90c; Bulk pack, 4 and 4½ tiers, equal proportion. No 2 grade for cooking, 65c. Edwd. A. Hall, Watsonville, Cal.

PATENTS THAT PROTECT are procured through Pacific Coast Patent Agency, Savings and Loan Building, Stockton, California. Established fifty years.

ASK FOR SNOW'S GRAFTING WAX—If your grocer does not have it, send to D. A. Snow, R. 3, Box 255, San Jose, Cal.

TREES AND NURSERY STOCK.

TRIBBLE NURSERIES, ELK GROVE, CAL.—Grafted walnuts and grafted paper-shell pecans. Exclusive propagators of Tribble, Mayette, Kerr Parisienne, Glady and Improved Franquette. 19 other varieties. Fine stock of almonds, prunes, Bartlett pear on resistant roots, and other fruit trees and plants. New list ready.

CALIFORNIA GROWN SUDAN GRASS SEED—Absolutely free from Johnson Grass or other Weed seed. Plant all you can of it; for Broody Chicks and laying Hens or stock of any kind you can't beat it. 30 cents per lb. Write for prices on large lots. Lasher's Hatchery, Petaluma, Calif.

CITRUS TREES—40,000 assorted—25c in tree row; 25c balled; subject to advance. All big, two-year-old stock. Choicest ever produced by anybody, anywhere, at any price. Lem A. Brunson, Santa Fe Springs Nursery. Office, 1120 Haas Building, Los Angeles, Cal.

BURBANK'S Spineless Cactus—Direct from the home of the originator, Santa Rosa, Cal. We are now offering the new improved varieties of forage and fruiting cactus for cattle, hogs and poultry. Write for our pamphlets and price list. J. I. Jewell, Santa Rosa.

WALNUT TREES — Late blight-resisting varieties grafted and budded on California Black and on FIRST GENERATION Royal and Paradox Hybrid roots, which are as much superior to the California black root; as the California Black root is to the English root—Eureka, Franquette, Mayette, Neff's Prolific, Concord and Placentia. Dr. W. W. Fitzgerald, Elks' Building, Stockton, Cal.

BUY PURE CALIFORNIA DESERT GROWN SUDAN GRASS SEED (and avoid Southern States Johnson Grass). Send $1.00 for sample 3-lb. package, postpaid; special price on larger quantities. Send for circular. Eich & L. Ranch, Lancaster, Calif.

FOR SALE—Manzanillo Olive Trees, budded on Picholine seedlings. Younger and heavier bearers, longer lived and more vigorous trees than trees raised from cuttings. Geo. E. Rice, R. 1, Box 76, Reedley, Cal.

WALNUT TREES—Eureka and El Monte varieties a specialty; also Franquette and Placentia. Write for prices and description of stock. Personal inspection invited. Eureka Walnut Nursery, Montebello, Cal.

FRANQUETTE AND MAYETTE grafted on California Black. Sizes 3 to 10 feet. Prices reasonable. Special discount on large orders. Sunset Nursery, 525 W. San Carlos St., San Jose, Cal.

MELILOTUS ALBA OR SWEET CLOVER—Recleaned and good seed 20c f. o. b. Any quantity up to 2000 lbs. Samples sent on request. V. M. Shuey, Manzanar, Inyo Co., Cal.

FOR SALE OR EXCHANGE—1500 San Jose Mayette Grafted Walnuts. Six to ten feet. Price low or will exchange on light auto or good heavy team. Chas. Story, Rivera, Cal.

FRUIT AND ORNAMENTAL TREES—Almond, Prunes and Pears. Berry plants. We contract to plant and care for orchards. Panama Nursery Co., Concord, Cal.

WALNUT TREES—Grafted and Seedling. Also fine field-grown Ganter and Harman Avocado trees. Write for prices. Magnolia Nursery, Whittier, Cal.

SOUDAN GRASS SEED—California grown and pure. For prices write undersigned and state quantity wanted. George Boock, Los Molinos, Cal.

TEPARY SEED BEANS—1915 grown. Fancy recleaned, 7c lb. Order now; limited supply. Dean H. Potter, Shafter, Kern Co., Cal.

WAGNER'S CRIMSON GIANT WINTER RHUBARB—Subdivided plants. $15 per 1000; $2 per 100. G. E. Shelford. Healdsburg.

SELECT LOCKEFORD BURBANK—Rural and American Wonder Seed Potatoes. $1.50 per 100. N. H. Locke Co., Lockeford, Cal.

ETTERSBURG STRAWBERRIES—Plants: dozen, 25c; 100, $1.50; 1000, $10. Delivered. E. Welty, Ripon, Cal.

FOR SALE—Spineless Cactus, 1½c per leaf. Inquire Mrs. E. J. Gallagher, Brown's Valley, Cal.

TEPARY BEANS FOR SALE—Eight cents per pound. Robert Paulsen, Lockwood, Cal.

FOR SALE—Spineless Cactus Plants. Prices right. B. C. Engbert, Byron, Cal.

PRUNE TREES—12 cents. Walnuts, 30c. Cash Nurseries, Sebastopol, Cal.

FOR SALE—Asparagus roots. R. F. D., Box 30, Walnut Grove, Cal.

APPLES, PEACHES—10 cents. Gage Nursery, Corning, Cal.

WANTED.

WANTED—About sixty young men and women to enter the Western Normal to prepare for teaching or to secure a high school education in the shortest possible time. Western Normal graduates secure and hold good positions. Time and money saved. For information address Western Normal, J. R. Humphreys, Principal, Stockton, Cal., Box 704.

WANTED—Position as foreman or superintendent large orchard or vineyard. Middle-aged married man. No children Fifteen years' California experience one place. Best references. Box 206, Rural Press.

WANTED—Position as manager of large orchard, vineyard, dairy. Alfalfa and grain farming. By a man with many years of practical California experience. Reference. Room 336, Hotel Alpine, San Francisco.

WANTED—Party with some capital to take one-half interest in one or more crops nursery stock. Best location on coast. $1000 or more required. T. J. True, Lancaster, Cal.

NURSERYMAN WANTS WORK—Pruning, grafting in orchard or nursery. Greenhouse work if required. Address Robert C Morrison, care Box K, Auburn, Cal

WANTED PROFESSIONAL BUDDER to bud 10,000 seedling peach trees. Apply H. F. Pixley, Corte Madera, Marin county, Cal.

LAND FOR SALE.

NEW OPENINGS—Enlarged Homesteads. Nearly TWO MILLION acres GOVERNMENT LAND, different counties, plainly marked on COUNTY SECTIONAL Maps, $2.50, any County. Booklet, map circular FREE. STATE MAP, showing 600,000 acres of SCHOOL land opening over State, $2.50. Order TODAY. Checks taken. JOSEPH CLARK, Sacramento.

I OWN AND OFFER FOR SALE 475 acres of land situated in Solano Co. between Dixon and Winters. Good house and barns. About 80 acres graded for alfalfa. Food wells and irrigating pump. Adjoins the successful rice fields of this county. Price, $60.00 per acre. $10,500 cash and balance on easy terms. J. H. Petersen, Dixon, Cal.

IN THE HEART OF SANTA CLARA VALLEY one mile from Mountain View. 36 acres—6 acres prunes; also some cots. Small family orchard. 6-roomed house and necessary outbuildings. Fine water. Excellent soil. Owner desires to retire. Price, $18,000; one-half cash, balance time. Mrs. Thomas Hayes, Mountain View, Cal.

FARMS WANTED—We have direct buyers. Don't pay commissions. Write describing property, naming lowest price. We help buyers locate desirable property Free. American Investment Association, 93 Palace Bldg., Minneapolis, Minn.

WANTED TO HEAR FROM OWNER of good farm for sale. Send description and cash price. B. G. List, Minneapolis, Minn.

ORCHARD, ALFALFA, STOCK OR RICE RANCHES for sale or exchange. Alex. T. Gibson, P. O. Box 361, Chico, Cal.

WANTED GOOD FARM, or unimproved land from owner. H. L. Downing, 145 Palace Bldg., Minneapolis, Minn.

Willys KNIGHT
Sleeve-Valve Motor

For Better, More Constant, Longer Service

Let the city man have his poppet-valve motor if he wants one.

His garage around the corner will take care of it for him—"tune it up" frequently and remove the carbon and re-seat the valves every few thousand miles!

But you probably have no such nearby facilities.

You have to be without your car for days—maybe weeks—when engine repairs are necessary.

The great Daimler—England's best known motor car builder,—says: "if there is no repair shop within miles, own a Knight Motored Car."

It will give you far the most constant service—far the greatest total mileage.

For instead of getting noisy and losing power and flexibility, as all other types of motor must, from the very nature of their construction,—

The sleeve-valve motor will steadily improve with use without any attention beyond oiling.

Carbon in the sleeve-valve motor only makes it run the smoother and quieter—only gives it greater power and flexibility.

And it will serve you more and more efficiently for literally thousands of miles beyond the life of any other type of motor.

We believe the Willys-Knight is the most economical car, in the long run, which a farmer can buy.

It will give him better, more constant, longer service than any other car at anywhere near the price.

See the Overland dealer now and talk it over with him.

Catalog on request. Please address Dept. 503.

Imperial County's Dairy Opportunity.

Complete rations grown at home, year around succulence, cheap shelter, improving standards of dairymen, progressive creamerymen, who advertise their brands, by-product factories, and better bred stock, constitute Imperial County's dairy opportunity.

[Written for Pacific Rural Press.]

IN A COUNTRY which was a burning desert fifteen years ago, still isolated from all civilization by more desert, and by an almost complete circle of mountains, some 300,000 acres are today supporting thousands of homes for some 50,000 people. Around these homes are eucalyptus and pepper trees, some of them a foot in diameter, at six or seven years, and on these broad acres are growing alfalfa, grain, cotton, cantaloupes, fruits, vegetables and livestock, the last named being the principal source of cash income.

Many more than 100,000 cattle graze the grain and alfalfa fields, eat the meal of the cotton seeds and the corn of the milo maize, making quick profits for the wiry men of endurance and vision, who are unafraid of a thermometer which registers oftimes 125 in the shade.

They almost always have plenty of water from the Colorado river, which rises slowly to its highest flood of the year during the hot months when it is most needed. They get two to four inches of rain per year, which is about that much more than they want. "Absolutely the only use we have for rain here," we are assured, "is to refresh the atmosphere."

Winter Succulence. — It frosts sometimes in Imperial Valley, but not enough to prevent growth of alfalfa and barley well over knee high in the dead of winter. What does usually prevent such tall growth is the pasturing of hogs and cattle.

In this fifteen-year-old country of conditions unlike those that prevail in any other section of the world, there is much for the wisest to learn; and there is much already learned that has not come into general practice, because many of those who live on the land are still struggling to pay for it and for equipment and livestock, and because in other cases, absentee landlords do not understand needs and conditions.

Cattle Injure Wet Fields.—Because there are so many rainless months, but little provision is made for rain protection. Thus we see cattle humped up during the rains on green or muddy grain and alfalfa fields, tramping out perhaps two-thirds of the next season's possible yield, and using most of their feed and energy to exist, without profitable production of either meat or milk.

Signs of Improvement.—Here and there the wiser ones with capital are dotting the level landscape with huge silos, and these are protecting their fields from cattle in wet weather, while others pasture only the milo cornstalks when alfalfa would be damaged. A very few are providing effective shelter. On many of the farms, wind and water piled up the sand through the flood-and-desert ages which preceded irrigation, leaving knolls higher and drier than the surrounding fields. Most of the thoughtful ones have built their houses, barns and corrals on these knolls. Located elsewhere, even the light rains would produce almost intolerable inconvenience, for nowhere else on earth, we believe, does a little mud contain more stickiness. Yet, this same mud, smiled on a few hours by the sun and fanned by the wind, becomes mellow and workable.

Here and There the Wiser Ones with Capital Are Dotting the Level Landscape with Huge Silos, and These Are Protecting Their Fields from Cattle in Wet Weather, While Others Pasture Only the Milo Cornstalks When Alfalfa Would Be Damaged.

Dairy Production. — Of all the cattle in Imperial Valley, nearly a third are dairy cows, which produce nearly six and three-quarter million pounds of butter per year. This butter has, until recently, carried a more or less undeserved reputation for poor quality. The original reason for such a reputation was the poor and sometimes rotten cream delivered by the dairymen. Many herds were located ten, fifteen, or twenty miles from the creameries, and frequent deliveries were impossible. Colorado river water only was available even for drinking purposes, and this is muddy at all seasons. Wood, coal and oil were expensive delivered at the ranches, and very likely the milk and cream cans did not get much scalding even with the pond-settled water. Perhaps the creamery people also were careless; and hot weather did the rest. The butter was acknowledged to be poor. So, when poor butter from anywhere reached the market it was often sold as Imperial Valley butter, without improving an already bad reputation.

Butter Quality High.—"But things ain't like they used to be." The local manager of the largest creamery corporation in the Valley recently showed us the receipt for the large daily shipment to Los Angeles, in which every lot scored 93.

"That is not hard to do now, in this cool weather," said he. "We are getting frequent deliveries now; and while we expect to

Los Angeles	.10	17.35	10.48	82	48
San Diego	.20	11.09	6.78	76	50

THE WEEK

THE week has surely been one of great action and interest. Two great citrus fruit displays have attracted thousands daily to Cloverdale and San Bernardino, and the point for the distant reader to consider is that these towns are about six hundred miles apart, and neither of them is in danger of falling off the edge of California. The next impressive point is that citrus fruits grow successfully in proper places throughout all this distance—which would carry you from South Carolina to Pennsylvania on the Atlantic coast. And all this is only one attribute of imperial California!

And while this single item may be taken as an exponent of the activity, achievement and capacity of the State at large, a token of metropolitan energy and alertness must be added to fitly represent the commonwealth of California. This week the San Francisco Convention League reports that during the five years preceding 1915 it secured for the city 118 conventions with an estimated attendanee of 140,000. For 1915 a total of 822 conventions was secured with an estimated attendance of 650,000 and an expenditure, at $70 each a week, of $45,500,000. Thus the league estimates that since its organization $55,300,000 has been spent in San Francisco by convention visitors. No wonder San Francisco is in the ears and eyes of the world; no wonder that achievements in the world's art, literature and industry hasten to claim attention in the Pacific Coast metropolis and count it as one of the world's great starting points for the conquest of fame. The other day Ex-governor Walsh of Massachusetts said: "San Francisco is really a city set apart, and destined for a most brilliant future. You let your city speak for itself, and it has a most eloquent way of saying things to all visitors, of your lively, thrifty, energetic people, your courage and enterprise, and, in short, your marvelous combinations of all these qualities."

And we count all this as gladness from the point of view of human progress and demonstration of possession of civilization and culture, which cannot be impeached for ambition which forgets humanity. For all these things add to the joys of living and promote the satisfaction in work which yields a living and the right to live well. Therefore, it matters little what your line of work may be, if it is honorable and useful to mankind, it gives you a right to resolutely claim your share in the unique growth and prosperity of California.

THE SPRING FLIGHT TO CALIFORNIA.

DURING the next two months we shall have a chance to see what effect the Expositions of 1915 will manifest upon those who, throughout this great country, are apt to choose the spring as the time to seek better places to live. Home-seekers in California will have the advantage of "colonists rates," which will bring people over the transcontinental railroads from March 25th to April 14th inclusive, at a rate, from Missouri river points, of $32.50 and from Chicago, $40.50. A tremendous influx of settlers to California is expected by railroad men this year. These are the people whom we most need and desire. The flood of European immigrants which we feared has been held back by the war—for a time, at least, and perhaps for a long time. The favoring rates from the Eastern States will add to our American population, and will help us to prepare for the larger influx of foreigners which will doubtless come later. Not that we are anti-foreign in our feelings, for we appreciate the throngs of good citizens of foreign birth who have done and are doing nobly in building up our industries and our citizenship, and they can learn Americanism as their predecessors from European countries have learned it. For this reason we take particular interest in this spring's increase in our population, and hope that it will be helpful to this State in building up its citizenship in ways to minister to the upholding of the best American standards of thought and action.

CAN MR. HAGGARD HOLD HIS BRITISH?

SPEAKING of emigration an interesting question is precipitated by the sailing from England of Sir Rider Haggard on a trip around the world, with a mission from the Royal Colonial Institute to investigate the chances for empire building after the war. His plan is to prevent the emigration to foreign countries of British soldiers and their families after the war, and to direct steady streams of these war veterans to the British colonies — South Africa, Australia, New Zealand and Canada, and the many insular colonies—"thus recruiting the population with a sturdy and intelligent class, and holding them within the British empire." It is plainly stated from London that the effect of Mr. Haggard's mission "would, of course, be to keep war emigrants from going to the United States or South American countries, where their status as imperial citizens would eventually be lost."

It is, of course, none of our business, whether the British take Britain, as the Dutch are said to have once taken Holland, or not. They have a right to build up their empire with their own people, or with any other people they, including Yankees, can get, for that matter, to 'ave and to 'old for good and all—and we wish them joy in doing it, for the British possessions are mighty good neighbors of ours. We can not, however, restrain our curiosity to see, a generation hence, how these assisted colonists will measure up with the self-willed British who will stem the imperial tide and come to the United States, against the current which Mr. Haggard will generate. And it is just that kind of self-willed British which we most desire. This country started with break-away British and break-away British can still help to keep it humming.

MOBILIZING FARMING WOMEN.

BUT the British are surely a long-headed lot and they have contributed a considerable amount of calculating coolness to the composite national trait of ours known as the American habit of mind. It may not be a part of Mr. Haggard's plan, but it will surely work in well with it—besides, it meets a situation now existing in the home country. It is cabled this week from London that the government has decided to organize a recruiting campaign for women to till the soil. Every village will be canvassed, and all who volunteer will be registered and given a uniform which consists of a coat, skirt, stout boots and gaiters. Already 250,000 men have been withdrawn from agriculture, and it is expected that 100,000 more will be lost to this occupation. It is essential that an army of at least 400,000 women be mobilized for field work, and the American traveler will not longer feel relieved as he crosses the channel to find that he has escaped from the rather distressing sight of women grubbing in the fields on the continent. Consolation must come from the thought that field-working by British women is only a passing experience born of necessity—and from the other thought that when Tommy Atkins comes marching home, there will be waiting for him a lot of farming "wenuses," one of whom he can clasp to his bosom, "stout boots" and all, and fly with her to "recruit the population" of the overseas empire under the pilotage of Mr. Haggard. We hope the government will not allow intimation of its long headed dream to penetrate the trenches, for Tommy might take to watching for Mr. Ford and forget to shoot.

PHASES OF PATERNALISM.

THE beauty of this great principle of paternalism, for and against which our people are so keen these days, is the illimitability of it. According to your point of view, you can neither get too much nor too little of it—therefore, it is a mighty good thing to fight about. Up the State, over a month ago, a mosquito bit the ear of a laborer on a country road. It does not matter whether he scratched his ear, or whether it was unclean, or not, because the doctrine of contributory negligence has gone by the board. And now the man thinks he ought to have pay from the county, under employer's liability, for loss of time, cost of treatment and recompense for pain. Well, why not? The bite of the mosquito is not an act of God, like a stroke of lightning, because we now have a law providing a way by which a geographical division of the State may kill mosquitoes, and if it can and does not, why is it not liable for damages to any

one who gets bitten? We cannot answer that question.

Again, we read about a Turlock cantaloupe grower who has invoked the aid of the Secretary of State to protect him from being sold cucumber seed for cantaloupe seed. The story, as printed, is that "the grower had between sixty and seventy acres under cultivation last season and that the cantaloupe seed he purchased under guarantee that they were Rocky Ford cantaloupes, turned out to be mongrel cucumbers. He says he contracted in advance of the season to sell his entire crop of cantaloupes"—and was no doubt badly hurt in mind and purse. We doubt the accuracy of the statement, because if he had legal guarantee from the seller, his line of effort for compensation would be plain enough. Probably he did not have guarantee, for it is not customary in the seed trade to give guarantees, but, rather, to publicly disclaim liability. If thus is this case, does the question go back to the old common law principle that the buyer must look out for his own interests, or is the grower right that the State should protect him from such hardship—and having failed thus to do, should the State compensate him for his loss and distress? We cannot answer that question either. This seems clear: that paternalism in the family, aside from the affection in it, is legally dissolved when the dependent becomes of age, and then in a way it is replaced by filialism, which has certain legal liabilities. But what about paternalism in a State? How does it ever get release? At a certain time or place, does it shift its burden upon fraternalism? Oh, well, we cannot answer that either. Until some of these things are settled we shall wear a bee-veil against mosquitoes, and watch the man while he takes our cantaloupe seed out of a muskmelon. There is the old maxim, God helps the man who helps himself, and we must admit that that seems to us a pretty good kind of paternalism.

OUR FIGHTING COLONELS.

WE ARE really sorry we joshed our colonels so hard last week, for they did not deserve it. They were really fighting valiantly, but we did not know it. Our idea of fighting is too old-fashioned, and we had an idea that, to fight, men had to go at each other. It has been explained to us that such is no longer the fact: that the way to capture the cliffs of Dover is to march off for Constantinople, and that to capture Berlin from Petrograd one has to go by the way of Bagdad. So you see our Colonels have been advancing all the time according to the principles of modern warfare and we did not know it—and we really ought to be shot for distrusting them.

To illustrate: Col. Weinstock has been fighting on several fronts during the week, as other columns of this issue show. He equipped and sent out from San Bernardino his southern expedition against the lost tribes of citrus growers—that 38 per cent which has been shooting carloads of oranges helter-skelter over the Eastern markets and making proper distribution impossible. The prospect is that he will route them inside of a week. On the east front he has proposed terms to the disgruntled almond growers and intimated to them that if they do not nestle soon he will flap them good and hard with the wing of the State. On the west front we understand he will reconnoitre the prune situation, and see how paternal uniforms will set on their rather knobby figures. So really, it has been a very active week along the line of letting the State do it, and results will be reported later, no doubt.

On the other hand, Col. Irish has been fortifying and trenching, and naturally has not consumed so much geography. He has been, however, practically just as busy. All last week he was moving for a central position in the Delta district, arranging to defend that country against political wind, which endangers the excellent work now going on for the improvement of the Sacramento river, and incidentally getting ready to put in several hundred acres of corn—which he will sell himself. He is acting on the conviction that if the State cannot sell onions, which advertise themselves so well, men must surely get nerve enough to sell for themselves other things which do not have that natural advantage. And so the war goes hopefully on. At first we thought we could stop it when we wished, but we are beginning to doubt it. You may find much about it in this issue.

Queries and Replies.

Querists must give name and address.

Which Alfalfa?

To the Editor: I am going to seed six acres to alfalfa next month. Seeing how they praise up the Peruvian alfalfa in the south made me wonder if it will do equally well here. I have never heard of anyone here using it. Does inoculation help to get a good stand?—J. A. A., Atwater.

Peruvian seems to be the best of the newer alfalfas, but we are not yet convinced that it is in all ways better than the common. If any one has clear convictions that it is, we would like to know it. In some places it seems to be a better winter grower. Inoculation will surely help alfalfa to grow, if the soil lacks the needful bacteria.

Transplanting Old Apples.

To the Editor: Will it make apple trees short-lived if they grow in the nursery until four years old and are then planted in the orchard? I set some out three years ago that were four years old; they all grew and have done better than one and two-year-old trees with the same care.—A Subscriber, Dunlap.

We see no reason why they should be short-lived as you have them well established and growing thriftily. You have done better than ordinary people would with four-year-olds, but you may live to see the younger trees outstrip them. They certainly will do it generally.

The Alder Flea-Beetle.

To the Editor: Can you tell me what kind of bug these are? I find them in dry grass. Where they are not disturbed they form in bunches. Are they a destructive bug? I have never seen any before to my knowledge.—W. J. B., Soulsbyville.

These are metallic blue-green beetles, nearly a quarter of an inch long, with a disposition to jump freely, which gives them their common name. Their scientific name is Haltica bimarginata. They are apt to occur in masses as you find them. They are waiting for the leaves to appear on the alders and willows, which they sometimes defoliate. These trees can be protected by spraying with lead arsenate. These lively little chaps are not charged with crop injury, although they might take to some garden plants.

When to Cut Back After Planting.

To the Editor: Some one-year trees just set out as received from the nursery have not been pruned. I am advised to wait until sap rises, as a preventive of sour sap. What think you? Is there any evidence as to the correctness of that theory?—J. J. C., San Francisco.

Your advice is given on the theory that sour sap is caused by engorgement. The fact is that probably it is caused by too little sap in the tissues, because the sap-receivers are destroyed either by rotting or drying, as soil conditions happen to be. Cutting after the sap rises promotes healing of the wound and may prevent dying back a bud or two—but you run the chance of the sap not rising at all because the loss of moisture through the whole remaining top may kill the tree before the growth of new root hairs can take more moisture from the soil. Therefore cut back immediately after planting as is the common practice. Carrying the whole dormant top is more apt to cause sour sap than to prevent it.

Painting over Fresh Cuts.

To the Editor: Can there be any harmful effect from painting fresh-cut wounds, over one inch in diameter, on apple trees, after disinfecting the cuts with corrosive sublimate? I have been told lately that the sap will collect under the paint and be held there, causing souring and decay, and that the wound should be left three to six months to dry before being painted. But will it not crack and become liable to infection from fungus, if not painted till fall?—R. B. P., Devore.

We have occasionally seen sap-pockets under paint-skins over amputations. It is better to allow the cut surface to dry and harden, but a few days or weeks is as good as the same number of months—in fact much better. There is not so much danger of crack-infection as you suppose. Besides the corrosive sublimate will protect the surface for some time. Go on with your pruning and do the painting at odd times next summer. In fact if you should forget to do it it would not matter much—except on cuts made by removal of large limbs.

Alfalfa and Sudan Grass.

To the Editor: Please find enclosed some alfalfa and inform me whether the seed is good enough to sow. What kind of alfalfa is it? Would it do to sow some sudan grass with it instead of oats?—Subscriber, Wheatland.

The way to get a test of the life, purity and, where possible, the identification of seed is to apply to Prof. J. W. Gilmore, University of California, Berkeley, in whose laboratory Miss Lute, an expert seed-tester of the U. S. Dept. of Agriculture, is constantly employed in this branch of the public service. It is best to write first for circulars stating character of sample to be submitted, etc.

As for Sudan grass as a nurse it is our notion that it would be worse than oats (if it grew from such early seeding as is usually best for alfalfa) because it would choke the alfalfa all summer, while oats will get ripe early and give the alfalfa a chance to grow. But it is pretty well settled that no grain crop should be sown with alfalfa. It is better, except perhaps at elevations where spring frosts are fierce, to give the alfalfa the whole ground and use no nurse-crop at all.

Present Knowledge of Citrus Fertilizers.

[Summary of lecture by Dr. H. J. Webber, Citrus Experiment Station, Riverside, Cal., given at National Orange Show, San Bernardino, Cal., Feb. 19, 1916.]

The citrus grower in determining the methods of fertilization best to use in his grove is confronted by a maze of contradicting so-called facts and theories. It is at present impossible to decide on any particular system of fertilization that can be said to be the best or that can even be recommended unhesitatingly as good. The whole subject is being investigated through the combined efforts of growers and the scientists of the College of Agriculture and of the United States Department of Agriculture. Information is accumulating from which in a few years a more rational method of fertilization of citrus orchards can undoubtedly be formulated. In the meantime orchards must continue to be fertilized. Can any suggestions of value be derived from the various experiments at the present time? The following disconnected comments on the results of various experiments may be of some value as throwing light on certain problems.

The factor that seems to stand out most prominently in various experiments and in the experience of good growers is the great importance of adding organic matter to the soil. The great majority of our desert soils are apparently lacking in humus. The most satisfactory methods of increasing the organic matter in the soil is apaprently through the growth of leguminous cover crops, such as bitter clover (Melilotus indica) and purple vetch (Vicia atropurpurea), and the use of such materials for fertilizers as stable manure, alfalfa hay, bean straw, and the like. Our understanding of the reasons for this beneficial action of organic matter is as yet very imperfect. Organic matter is known to open up the soil, render it lighter, and better the tilth. Such soils are more porous and take the irrigation water better, and do not seem so prone to form a plow sole. An abundance of organic matter in the soil also favors the development of the bacterial flora of the soil that are known to be of such importance in breaking down and transforming the various manural elements into forms soluble and available to the plant.

The evidence available regarding the use of cover crops points strongly to the greater value of using leguminous plants instead of cereals or other non-legumes, primarily because the legume not only adds organic matter but also nitrogen, and furthermore because the experience in growing legumes in orchards and with other crops indicates that there is no detrimental effect produced by associating these plants together.

Of the various plant food elements that are usually applied as fertilizers, nitrogen in California soils is by far the most important. From what source the nitrogen should be taken at present would seem largely to be a question of economy only. The one exception to be made to this statement at present is in the use of nitrate of soda. The experiments at the Citrus Experiment Station that have been under way for nine years clearly show an accumulating injury from the continued use of this material. Plats fertilized with nitrate of soda for several years gave excellent results, but later became badly mottled and began to fail. After nine years their condition has become serious, no fruit of any value being produced. It may be that the use of certain other materials along with the nitrate of soda would have retarded this injury, but in a region where the soils are practically all in some degree alkaline, it would not seem a wise policy to add continually still larger quantities of sodium. As nitrate of soda contains a dangerous element, its use in the fertilization of citrus trees in California should be discouraged, particularly as many other sources of nitrogen are available at as reasonable cost. Dried blood, tankage, sulphate of ammonia, nitrate of lime, and many other sources of nitrogen are available at as reasonable cost, and no question of injury from their use has yet been found.

A factor of great practical importance is found in the possibility of using such home-grown products as alfalfa hay, bean straw, and the like. These materials are rich in nitrogen, and in using them the grower is also adding large quantities of organic matter as well as small quantities of phosphorus, potash, and other desirable elements in about the proportion usually needed by plants. When such materials can be obtained at a fairly reasonable price, the value of the nitrogen in them alone would justify their use. As an illustration, alfalfa hay contains usually about 2.25 per cent of nitrogen, so that at $8.00 per ton one would pay but $3.55 per unit of nitrogen, which is much cheaper than it can be obtained from most sources. The same is also true of bean straw. No special statement need be made regarding the use of all stable manure available. There is apparently no better material to use in an orange grove in California.

The general use of home-produced materials such as the above will add greatly to the wealth of California products, and where they give equally good results is certainly to be encouraged. Doubtless millions of dollars have been expended for imported materials that might more probably have been expended for home products and have assisted in building up our own industries.

Phosphoric acid, which is a principal ingredient in all of our fertilizers, has in some experiments given indication of increasing the yields slightly, but its importance is not so clearly evident as that of nitrogen. It would seem, however, that the application of some phosphorus will prove of practical value. The comparative value of raw rock phosphate and super-phosphate has not yet been fully determined.

In times past large quantities of potash have been used in fertilizing orange groves, the sulphate of potash being almost universally used. In the experiments at the Citrus Experiment Station three plats treated with potash for nine years have given an average yield little or no larger than three similar plats to which no fertilizer was added. The indications at present are that potash is a fertilizer of doubtful value.

CALIFORNIA'S FRUIT ACREAGE.

The above tabulation of the fruit acreage in California is furnished us by George W. Weldon, chief deputy of the California Horticultural Commissioner. While there may be inaccuracies in it in places, it is probably the most reliable set of figures of the kind ever compiled in this State. The table is of value as a basis for estimating fruit production.

—FRUIT TREES—

Propagated from Proven-Bearing Orchards.

Why is it that the most successful growers in our own section buy their trees from us? Because they know our methods. They know that our stock is always clean, healthy, and sure to give satisfactory results. They know that all scions are selected by experts. They know that better trees than ours cannot be purchased anywhere at any price.

V. A. PETERSON ALFALFA SEED CO., Arbuckle, Calif.

An Appeal to Almond Growers.

[By Col. Harris Weinstock, State Market Director.]

The attention of this Commission has been called to the fact that the effort of California Almond Growers' Exchange to market California almonds at prices remunerative to the producers is more or less hampered by the fact that the producers who are not members of the Exchange and who sell to the speculative buyers, afford such speculative buyers ammunition with which to demoralize and kill prices to the ultimate injury of the grower.

A letter received from the New York representative of the California Almond Growers' Exchange has been shown me which goes on to recite that certain California packers are offering to sell California almonds at ⅛ of a cent per pound less than any price which may be quoted by the Exchange. It can easily be seen how demoralizing this sort of competition must be.

There is a natural conflict of interest between the Growers' Exchange and the speculative buyers. The speculative buyers seem to feel it to their interest, if possible, to kill the Growers' Association and the method seemingly pursued is to endeavor to create dissatisfaction at both ends of the line. To the eastern buyer is offered a price a fraction under that of the growers' organization, while discontent is caused at this end of the line by paying to a few growers a little more than can be realized by the organized growers —the object being to cause talk—a proceeding perfectly safe and practical, as the net cost can easily be made good by averaging high buying against low buying—successful in the principle that the happy grower will shout aloud his advantage, while the farmer who receives but little will be silent. But this method, pursued to its logical end must mean that if it succeeds, in due course it must destroy the Exchange, and the producer at this end finds himself at the mercy of the speculative buyer and the consumer at the other end must pay a maximum price.

It must therefore be plain that the producer who does not stand by his organization and resist the temptation of a temporary better or equal price, is sacrificing tomorrow for today. The wise man would rather sacrifice today for tomorrow, because the present is brief and the future is long.

There is a natural struggle between the producer and the speculative buyer, each seeking as nearly as possible to control the output,—the producer, in order that he may get a remunerative price for his product and that it shall not needlessly be forced into competition with itself; and the speculative buyer, in order, if possible, to eliminate or curtail impertinent interference on the part of the producer.

In the interest of and for the welfare of the State, it is far more important that the great body of producers shall get remunerative prices for their crops than a comparatively few speculative buyers shall make big profits.

An appeal is therefore made by this Commission to the Almond growers of the State, who are not already members of their organization, to become members and to support its management in its earnest endeavor to insure for the Almond grower a fair price for his product not only this season, but every season. As can easily be understood, this can be done only if the supply is controlled and distributed by the producers collectively through their organization.

DARKENING OLIVES.

To the Editor: Please tell us if ripe olives that are cured for market have something put in to keep their color. I cure perfectly black olives when put into lye, but when done they are mottled and of greenish cast.—Subscriber, Oakley.

[Answered by Prof. Bioletti.]

[I know of no chemical which can be legitimately used for retaining the black color of ripe olives. The color is kept intensified by skillful handling of the lye treatment and exposure to the air at intervals during this treatment. The exact method used varies with the different producers who make more or less of a mystery of the matter. In a general way the process consists of a partial lye treatment with a fairly strong lye, one and one-half to two per cent, followed by aeration for 24 to 48 hours and a supplementary treatment with a weak lye, say from three-quarters to one per cent, until the lye treatment is complete, with supplementary aeration with the weak lye treatment if necessary.]

APPLE ROOTS PRUNED.

Apple trees six years old persisted in making standard trees though as persistently winter-pruned to make them dwarfs. At that stage their management was taken up by E. S. Malis, now of the California Polytechnic School at San Luis Obispo.

They stood beside a thoroughly fertilized asparagus bed. Their youth, winter pruning, and the fertilizer made them grow wood, but very few fruit buds. Malis cut off some of their main roots in late April, summer pruned the tops, did not winter prune any more, kept them thus to the dwarf size, and in the second season got "quite a crop" from them.

State Will Aid Orange Shippers.

The following address by Col Weinstock at the 48th Fruit Growers' Convention held at San Bernardino, February 18 and 19, as well as the resolution that follows, is of interest to those who are desirous of state aid in marketing farm crops: "My message to the citrus fruit growers of California is that they must do two things to get the best results for their products in the eastern markets: They must pack their products in such shape that they will come up to standards. They must invite State inspection in order that in addition to their local shipping labels, the State label may be placed upon their product. In this wise they will be capitalizing the good name of the State to aid them in getting the confidence of the eastern buyers and consumers for their fruits, which to the grower ought to prove a most valuable asset.

"Then they must urge their shipping companies or their co-operative associations, through whom they ship, to join and co-operate in establishing the proposed State Bureau of Distribution so as to prevent the glutting of eastern markets which always has and always will mean a great waste at the expense of the producer. One of the things that has restrained producers and shippers from establishing a clearing house which might be regarded as a monoply was the fear of being prosecuted under the Sherman Anti-trust Act for activities in restraint of trade.

"Attorney General Webb, however, makes it clear in an opinion rendered by him to me that the State can engage in such activity without violation of the Sherman Act, since it would be done without any aim on the part of the State to make a profit for itself or to fix or control prices, but in the interest of the common good in the interest of the consumer as well as the interest of the producer.

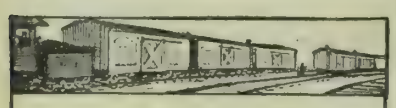
"The consumer is as much a victim of gluts as is the producer. The glut means a feast today with possible prices to the consumer below cost of production. A glut today as a rule means frightening off the shipper tomorrow thus causing famine tomorrow with excessive prices charged to the consumer.

"What the consumer should have is a regular and steady supply which in turn means a regular and steady price, spelling for him in the long run a lower average price than when there are violent fluctuations in price."

After further discussion of the subject of marketing the convention adopted the following resolution: Resolved, That the chairman of this convetion be hereby instructed and authorized to appoint a committee of seven whose duty it will be to get all citrus fruit shippers, shipping companies, buyers and growers' associations to pledge themselves in writing on or before April 1st, 1916, to join in supporting the State Bureau of Distribution; that such committee, for the information of the growers, shall through the press apprise the growers on or about April 1, 1916, of the names of those who have so pledged themselves: That the following pledge shall be circulated by the committee among the shippers, buyers, shipping companies and growers associations for their signatures:

"We the undersigned, hereby agree to become adherents to the State Bureau of Distribution to be organized by the State Market Director for the purpose of routing and diverting the Eastern citrus fruit shipments in such manner as to prevent gluts and to get to each market its maximum supply, it being understood that the car dispatcher who is to perform the service of routing and diverting the cars shall be nominated in conference by the representatives of the adherents to the State Bureau of Distribution and appointed by the State Market Director, it being further understood that the Market Director will appoint as an Advisory Council to the car dispatcher, such representatives of the adherents as by them may be chosen, it being further understood that the adherents will continue to operate East and West in the same independent manner in which they have heretofore operated, reserving to themselves the right to retain their present Eastern machinery for distribution and their present Western machinery for securing and making shipments, it being further understood that the proposed Advisory Council will arrange schedules and quotas of distribution that as nearly as possible will be just and equitable to the adherents, and that the fruit will be routed and diverted in a manner to respect so far as possible the preference of the owner of such fruit."

Curing Walnut Blight.



[Written for Pacific Rural Press.]

"I believe that only sick walnut trees get blighted. I believe anyone can make a tree so healthy in this country that it will resist blight," says G. E. Franklin of Carpinteria.

"You can graft or bud from a blight-resistant tree onto one which blights and the resulting growth will blight. That is because in grafting, you let more wood grow than you have cut off. The trouble with the blighted trees is that their tops are weakened by growing so much that they overbalance the root system. It is the fruit and leaves that are naturally first hit."

Mr. Franklin claims to have trebled the crop of salable nuts from a 20 year "Rib Softshell" tree which has been treated four years, and has eliminated the blight, though nearly all of the 300 trees in the same orchard have some blight. The leaves on this tree are doubled in size, and when seen Jan. 7, a large proportion were still on the tree and green, having shaded the nuts till they were harvested. Seven 50-pound sacks of nuts were picked up from this tree last fall. Another one treated three years showed great improvement, but still some blight. His brother cut many smaller limbs from another orchard in the winter of 1914-15, greatly improving quantity and quality of last year's crop.

"Four things are necessary for blight control." (1) The soil must be right for walnuts; (2) the tree must have proper cultivation, fertilization, and enough water; (3) if it blights then, cut off a big limb close to the body. This is to relieve the strain on the roots and make the rest of the tree healthier. If a big limb is cut at a distance from the crotch, in two years it grows more wood than ever and is in a worse condition; (4) if blight appears

Why Not Cut Off the Two Cars of Filler?

It takes 400,000 cars to carry Fertilizers to our farmers every season. Forty per cent. —2 cars out of 5—is Filler. Order higher grades and Nitrate of Soda for your active Nitrogen and save freight.

The greater producing capacity of high-grade fertilizers without much filler means bigger out-bound tonnage for railroads and bigger purchases by farmers.

Send for "Cost of Available Nitrogen."

again, cut more big limbs until the roots and tops are balanced. If you cut a tree with too much top, you will get bigger and better nuts. Perhaps invigoration of the roots might serve the same purpose by providing the conditions mentioned in (2).

Last fall, Mr. Franklin became so convinced of the worth of his method that he cut at least one big limb from every tree that had shown the disease. Several big ones had been cut from the one treated four years. All of the big wood cut out last fall made a pile of 8 or 10 cords.

These cuts should be made as soon as the crop is off, so the tree won't bleed and will begin to heal at once. Protective paint should be kept on in good condition year after year to prevent the inside decay. If big cuts are made too late in winter they are likely to bleed till summer.

Young trees can be trained with a smaller top than blighted trees usually have in comparison with their root systems, and thus the big cuts will be avoided.

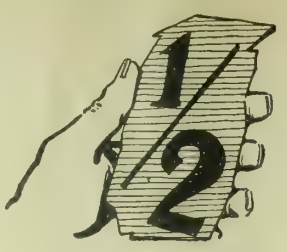
SUPPORTS COUNTY QUARANTINES.

To the Editor: In regard to the editorial comment on inspection duties of the county horticultural commissioner and Mr. Hecke's remarks on same.

You maintain that a quarantine established at the State line would answer in place of the present state and inter-county quarantine.

[The suggestion was that it would make the state quarantine more complete and trustworthy.—Editors.]

If there is a necessity to establish a quarantine station at the state line, to inspect trees or fruit produced a mile or more beyond that state line; then what objection could there be to a county in the north rejecting certain products from the southern section—some seven hundred miles distant?



As an illustration of a particular inter-county quarantine: In Butte and Sutter counties, we quarantined all stone fruit trees from districts where peach root borer is known to exist. In these two counties we have thousands of acres of almond, peach and prune trees, and do not have this pest. Whereas in the Santa Clara Valley one may see men out in nearly every orchard digging little basins about the trunks of each tree and then ramming a wire in the burrows of these borers, to kill them.

Previous to the establishment of this quarantine I have personally condemned thousand of nursery trees from the Bay region, because they were infested with borer. And I believe the commissioner from Sutter has had the same experience.

As to the lack of support accorded the county commission in this inspection of trees: In order to properly perform our duties it is not necessary to have applause from any one; but to use a vulgarism, "You never miss the water until the well goes dry." Similarly, the growers will not miss these county ordinances until they have the delightful experience of standing on their heads while punching a wire down the burrow of the Peach root borer.

Views in the Pear Orchard of Mr. B. M. DENISON, Tehachapi, Calif

"—my Bartlett pear orchard of 40 acres has made a remarkably fine growth, and excites the admiration of everyone who sees it. Within two years after I had planted my orchard, it had made such a remarkable growth and the trees were so thrifty and free from disease, that it attracted wide-spread attention.

"Althrough I gave the orchard the best of attention, I do not hesitate to say that your advice concerning pruning and general cultural directions has had much to do with the uniform, shapely appearance which the trees present today. Experts have pronounced these pears perfect in appearance and exceeding in quality anything which they have ever received from any other section of the country."

No Matter What You Need in Nursery Stock---

We can supply you with splendid specimens of almost every variety. Our stock of Bartlett Pear trees is the finest we have ever grown. What Co. Horticultural Officers Should Do

The following are notable prophetic paragraphs from an article by G. H. Hecke, County Commissioner of Yolo County, to which editorial reference was made last week.

In the past, County Commissioners have done much good work on educational lines. They have been careful to the new settler in advising him how to plant and how to take care of his plantings. They were well to the front when it came to the protection of the older plantings and control of disease.

But a period of readjustment is near. Important changes in the dissemination of agricultural knowledge have been introduced by the University of California in co-operation with the United States Department of Agriculture. These changes relate to the appointment of a Farm Adviser, following the organization of a Farm Bureau in any county, where the demand for such an adviser exists.

An Executive Function. — But there is one thing that the Farm Adviser will never be able to do. Being a member of the University, he cannot be permitted to execute quarantine and control work, force eradication or perform other executive police duties. The farm adviser's duties are to co-operate with the farmer and disseminate agricultural knowledge through the farm bureau and its units.

On the other hand, the County Horticultural Commissioner has given to him legal power to enter upon any premises, orchard, nursery, packing-house, depot, etc., whenever he shall deem it necessary, and if these places are found infected with dangerous disease, insects, etc., to take certain legal measures to cause control or force eradication.

Other Work for Commissioner.—But with the growth of our horticultural industries a readjustment must come, and when the time is right for further legislative action it will be shown conclusively that this county office, that has been weakened in its importance by the appointment of Farm Advisers in some counties, must be strengthened in other ways. We might as well endeavor to do without our Sheriff or police officer as to do without our County Horticultural Commissioner.

Spread of Plant Diseases.—And this growing commonwealth of ours is beginning to learn the necessity of preventing the spreading of certain insects and plant diseases from one county to another. We are learning that we must begin to control thistles on the roadside, water grass pests in our rice culture and weed pests generally. It is true that sporadic efforts to enforce such control have been made. In some counties the pear men are protected, the County Commissioner endeavoring to control the pear blight. In some counties thistles are under control, the Yellow Star thistles, for example, while in other counties nothing is done. This indicates that these sporadic efforts do not pay, and that we must cease to proceed in this haphazard way.

Uniform Standards of Fruit.—The same complaint may be made in regard to other executive work that should be performed by the County Horticultural Commissioner. The serious economic condition that our deciduous fruit industry is passing through calls for uniform standardization of our fruits. Here again some counties are practicing proper standardization under special laws; others are working on different fruits under different laws.

Many representatives of the industry have come to the conclusion that, while the foundation of our horticultural laws are eminently strong and sound, with the coming of new conditions and the astonishing spread and growth of horticulture, the time for a readjustment is near.

Under Stronger Laws.—And when this readjustment comes it will make the County Horticultural Commissioner, after due examination as to his qualifications, a respected official of the county government, working under stronger laws, drawing his pay by the month like any other county official, and devoting his entire time to his duties. By presenting a careful budget for his work to his Board of Supervisors, they will provide for the necessary means of insect and weed control and also give him sufficient latitude to assist in the organization of his growers for co-operation and standardization.

"I'll venture to say that half of the time of the Experiment Station men is spent away from Riverside," says Director H. J. Webber, which goes to show that the University is mixing with their theoretical and laboratory work, practical orchard studies throughout the citrus growing sections.

The Present Prune Problem.

[Written for Pacific Rural Press by Silvert H. Shelley, C. E., San Jose.]

The year of 1915 has given some idea as to what can and what cannot be done in the way of organization. The report of the Committee as given at the mass meeting lately held in the Garden Theatre shows that though they have successfully carried out their purpose of guiding the fruit growers in the selling of their products yet it was found very difficult to procure quick and reliable information regarding the market. Hence the need of an Information Bureau with a paid secretary, supported partly by other counties as well as Santa Clara county. But further than this it would be too great an undertaking.

Moreover, the prunes of other counties, many of them taking three pounds of green to one pound of dried, instead of two pounds of green to one pound of dried—thus showing a poorer quality. Each county therefore should have its own organization for disposing of the products, joining in the central Information Bureau. Such an organization of the whole State as Colonel Weinstock suggested, might be good—especially in theory—but the growers are not prepared to maintain such a big enterprise, and it would therefore be doomed to failure. The small active central Information Bureau to deal with the question of prices is what should now be attempted.

But there comes up in connection with this the question, could the Committee be as helpful, every year, to the growers as in 1915? There was then a small crop; speculators sold early and therefore, information and the holding for better prices were all that was necessary to make a good season. Next year there is likely to be a big crop. The United States will not consume much more—this has been proved again and again—and so either there will be low prices or a holding over till the following year, which would spoil that season's prices. It is evident, then—especially in a year of big crops—that a wider market is required as well as better information. With European prunes cut off from South America, is not this the opportunity for California to increase her shipments there beyond the usual amount, and so leave an ordinary number of tons for consumption in the United States? The price could then be fair even with a big crop.

If the packers are left to do this, the growers will get little good from it; besides the packers are not likely to concern themselves when it affects them so little. It would also be a risky venture for them because South America is a long way off and prunes processed here will very likely be mouldy before consumption.

Instead, suppose the growers through the central Information Bureau and the small organization already in existence, sent over to Buenos Aires as a distributing point for that continent prunes not processed or packed, but dipped only in hot salt and water to cleanse them. Then process and pack the prunes over there as needed. This would require a small outlay—a practical fruit grower, not a packer, who understood Spanish; possibly a good salesman; a few laborers for the work of packing and a small packing plant. Warehouses there could probably be rented for a year or two. Here the Farmers' Union of Campbell already has one warehouse. The whole plan could be carried out for $15,000.00 or $25,000.00. There would be scarcely a chance of loss, for prunes simply sterilized and not processed and packed, keep indefinitely. It would introduce California prunes in their perfection. It would give the grocers and jobbers a chance to order any quantity so as to have none deteriorate on their hands. This would be an incentive to push the product. The seasons being reversed in South America and here, would also help matters.

Finally, this plan, if carried out, would mean good prices even with large crops; would free the growers from the control of the packers and make them independent, and would require very little outlay, as the business could be built up from a small beginning but expanded rapidly as desired.

What do the growers think of this? Can we not have a discussion on this subject so vitally interesting? Can we not have a discussion not only of the whole plan but of the various phases of it?

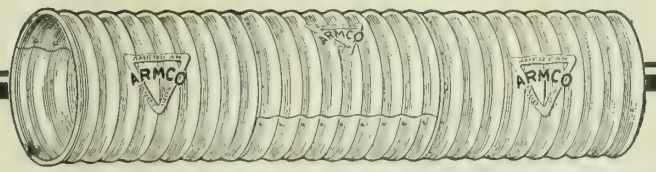
Heavy shipments of lettuce are being made from Brawley, Imperial county, at this time to points east.

Pure Wool Costs Money

in a Coat or a Blanket

IT'S very much easier to buy goods which contain a little cotton or shoddy, and they look just as well at first.

The difference shows up in the wear. The cheap garment soon wears shiny, then threadbare, then shows gaping holes, while that made of pure wool is practically as good as new.



It's just the same with Pure Iron for Road Culverts or other uses in which it is exposed to the elements. After cheaper material has rusted to failure, "Armco" (American Ingot) Iron will still be strong and sound—good for long years of service.

"ARMCO" IRON CORRUGATED CULVERTS

are made from the purest, most even, and most durable iron on the market. Look for the Triangle Brand. It is your guarantee of service value.

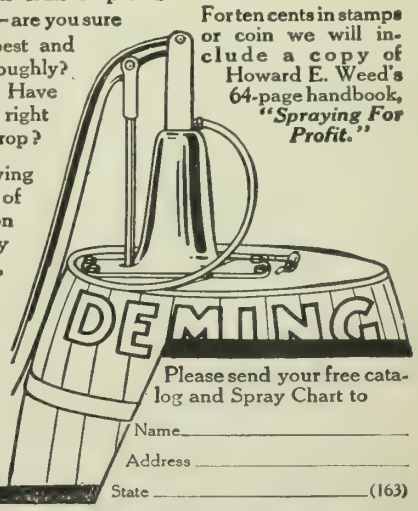
DEMING HAND and POWER SPRAY PUMPS

FREE



NEW 1916 SPRAYER CATALOG

IT pays to be sure in spraying. Don't waste your time with inferior spray pumps. Get out of spraying all the good there is in it.

You know spraying is profitable. You know it increases your fruit crop and your income, too. But—are you sure you are doing it the best and quickest way? Does your spray *cover* thoroughly? Is your pump built for long, hard service? Have you a spray chart that tells you just the right time and right mixture for spraying each crop?

Write for our new 1916 catalog showing 27 interesting views of different types of hand and power sprayers. It is free on request. With it we will give you a copy of the famous Deming Spray Chart, 16x22 inches in size, which gives you authoritative facts on when and how to spray. Write or use coupon.

For ten cents in stamps or coin we will include a copy of Howard E. Weed's 64-page handbook, *"Spraying For Profit."*

Bark Washes Against Rabbits

Although the bark-washes prescribed by D. E. Lantz in Farmers' bulletin No. 702 are chiefly directed against bark-gnawing in snowy countries by ravenous rodents, they may help some of our readers under other conditions:

The most promising simple washes for protecting large trees from rabbits are those containing lime mixed with sulphur or copperas in various combinations. Lime alone is not sufficiently permanent, especially where much rain falls. When mixed with sufficient copperas it has a deep green color and sticks much better. The lime-sulphur wash commonly used to destroy San Jose scale in winter has often proved successful as a rabbit repellent, but its lack of adhesive qualities often makes it fail. The defects may be partly corrected by mixing salt, soap, or a cheap glue with the lime and sulphur while the wash is still hot.

A poisoned wash of starch and glycerin, tried during the winter of 1913-14 in Idaho by a field agent of the Biological Survey, gave excellent results in protecting young orchards from jack rabbits, and would probably be equally effective where cottontails are concerned. The wash is prepared as follows:

Dissolve 1 ounce of strychnine (sulphate) in 3 quarts of boiling water. Dissolve ½ pound of laundry starch in 1 pint of cold water. Pour the starch into the vessel containing the strychnine and boil the mixture a short time until it is clear, adding 6 ounces of glycerin and stirring thoroughly. When it is cool enough apply with a paint brush to the tree trunks.

The glycerin and starch adhere well and form a thin coating to the bark. Rabbits attacking the trees will be quickly killed. In the Idaho experiments none of the trees were damaged badly enough to affect their growth and all the rabbits in the orchards were destroyed.

ANNOUNCEMENT OF ADVANCE IN PRICES

We are compelled to announce an advance in prices of Oliver Plows, as a direct result of the European war. The advance in the cost of raw material has so largely affected the cost of production of plows that no other course is open to us. We regret the necessity, but it is unavoidable.

Please understand, therefore, that higher quotations on **Oliver Plows** by your local dealer will be made to cover the higher prices they will be compelled to pay.

If the existing conditions continue, still higher prices will result, and plows at present prices will look like bargains.

We have no thought of lowering the quality, lessening the weight, or employing any other subterfuge in order to continue present prices. Factories that fail to cover themselves by an advance in the present emergency, automatically convict themselves of having heretofore asked too much for the kind of goods they were delivering, or they propose to cheapen their product.

ECONOMICAL GRAIN IRRIGATION.

[Written for Pacific Rural Press.]

Water in the country bordering Coachella on the east is not so expensive after the wells are put down, but ranchers there have learned economy in its use. One of them is A. A. Allen, who was recently using a furrow system on grain.

The 20-acre field had been irrigated and prepared flat and sowed early in January. It was at once ridged with an orchard cultivator, the ridges being about two feet apart and the furrow between being about eight inches deep.

"Maybe some of the grain is covered deep, but it comes up all right through this light soil," said he.

A flowing artesian well half a mile away was supplying enough water to give about 14 miners' inches at the field, and this was being turned into 14 furrows at once. It did not keep Mr. Allen very busy, as he left it running at dinner time.

"It subs through the ridges and the soil does not bake and allow the water to evaporate, as it does even here if we flood. Likewise we save what would evaporate from a flooded field during irrigation."

SAND BURS IN ALFALFA.

To the Editor: I have some sand burs in my young alfalfa. They are in quite big bunches. How can I get rid of them? Some people say they won't continue to grow if I don't cultivate the ground.—H. M. B., Turlock.

[Sand burs are pretty hard to kill, but if you will help the alfalfa by clipping before the weeds go to seed, it will run them out. Be sure to clip early and often for the seed drops from the stems of the burs before you think it would.—Eds.]

Allan S. Patterson has purchased 15 acres of bearing prunes in Browns Valley from E. Smith.

Dead Squirrels--

BUDDED AVOCADO TREES

"The Avocado as Grown in California," a booklet recently issued, will be sent free upon request.

GROWING budded avocado trees of merit (good trees of the best varieties) is our business—not a side line with us. We are now, and have been for years, devoting all our time to this work. We are dead in earnest in our desire to see the avocado industry progress along conservative lines into the best horticultural business of California.

Many ranchers have already planted an avocado orchard. We have sold the trees to the most of these. Others are thinking of planting. To them we extend a hearty invitation to come to the West India Gardens. You will be welcome, and our time is yours for the discussion of avocado growing.

We have in stock budded trees of all good varieties. Our prices for these trees are as low as it is possible for such trees to be produced and sold at a legitimate, reasonable, profit. The best varieties, the large fruited Guatemalan types—those that are best suited to commercial growing—are more difficult of propagation than the small thin-skinned Mexicans; consequently the trees cost more. We have some cheap trees, trees that we can sell you at $1.00 each, but these are not the trees you will want for a high grade avocado orchard.

F. D. POPENOE, Pres. WEST INDIA GARDENS Altadena, Los Angeles Co., Cal.

PEARS!

We have a large surplus in Bartlett, Winter Bartlett and a good assortment of other varieties. Mostly short, heavy 3 to 4 and 4 to 5 foot grade. Very attractive prices for orchard planting. Do you know any fruit which maintains prices better than pears? Winter Bartlett begins to bear earlier than any other variety. Get our special prices. And our Catalogue that tells the Truth.

California Garden Flowers $1.50 Postpaid Pacific Rural Press

Orange Show and Fruit Conventions.

[Written for Pacific Rural Press.]

With an attendance never before equaled, the Sixth National Orange Show held at San Bernardino, February 17-24, was conceded to be one of the most successful enterprises of its kind ever held in the West.

The show was unique in that the management had to refuse many applications for space both in the display and industrial tents.

Sweepstakes on Washington Navels went to the Pachappa Hill groves, near Riverside, on a fancy lot of exceptionally high quality fruit. Sweepstakes on lemons went to the Etiwanda Citrus Fruit Association, yielding as did the orange sweepstakes $100, a cup, and a banner.

Lindsay had to content herself this year with first prize on her feature display of an orange stagecoach and four horses with orange harnesses, dashing down a steep mountain road of oranges. She also won first with a $50 premium on the best 48-box display of oranges regardless of variety, and other high awards.

The C. D. Hubbard Co. of Carpinteria won three seconds on lemons, besides on the best 48-box display.

Aside from these awards, all other premiums went to Southern California, mostly to Riverside and San Bernardino counties.

Two large tentsful of automobiles and accessories and orchard implements and supplies were interesting and educational features of the show.

Citrus Convention.—One of the chief attractions was the holding of the Citrus Convention February 18th and 19th. Intense interest, free, and sometimes fiery discussion on the floor, and heavy attendance of growers, characterized these meetings. The programs were full of big men and big subjects.

The convention opened with a discussion of the 8-to-1 test, the opposition being voiced most ably by W. W. Hinsey of the Fair Oaks Fruit Co. Points were made on both sides, but preponderance of evidence showed both the profitableness of the 8-to-1 standard to the orange industry of the State and the need of different cultural methods by those growers in the sections who now oppose the standard.

The subject of scale control by parasites, spraying, and fumigation drew out a spirited discussion.

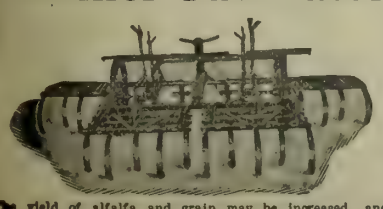
The climax of attention, discussion, and attendance was Saturday afternoon, when the subjects of ferlilization, nitrification, and the movement of nitrates in the soil were presented by Director H. J. Webber, Prof. I. G. McBeth, and W. P. Kelly of the Citrus Experiment Station staff. The station is surely being depended upon very largely by citrus growers for solution of their problems.

Saturday night G. Harold Powell showed the inner workings of the marketing system and illustrated by charts the fact that this year the growers are getting a larger proportion of the consumers' dollars because margins of middlemen and cost of operating the Exchange have been decreased.

Resolutions as reported by the Resolution Committee were passed as a whole without discussion. Frederick Maskew of the Import Quarantine Service was introduced as successor to Dr. Cook in the State Horticultural Commission office. The committee of three appointed by the Visalia convention to work out a suggestive revision of the State horticultural laws was abolished, to be replaced by a similar committee to be appointed by Dr. Cook and to include himself. Gratitude and regrets were expressed to the retiring State Horticultural Commissioner, whose health would not permit another term of such active work. A committee of seven, to be appointed by Dr. Cook, was suggested to confer with the State Market Director to work out a plan whereby citrus fruit shippers may all co-operate with the State in preventing gluts of the Eastern and Western markets with California fruit. This committee is to report at the next regular or special fruit growers' convention.

Apple Growers' Convention.— On Friday and Saturday the apple growers of Southern California held their special convention, and are to be congratulated on the interest and attendance of their meetings. It is not generally known that the industry is of such magnitude or of such future importance as was brought out at this meeting by the statement that there were 9.700 acres of apples in the Yucaipa, Beaumont, Victorville, and Oak Glenn districts.

Pruning, spraying, cover crops, varieties, packing, and marketing were discussed during the two daylight sessions.



Horticultural Inspector J. B. Hundley of Yucaipa noted that lack of pruning in young apple trees brings serious results later.

Deputy State Horticultural Commissioner G. P. Weldon pointed out that apple-growing could not be made profitable without spraying for codling worm, and many growers of Southern California who do not now spray will either accept this advice or learn by bitter costly experience.

Several large growers agreed that the principal variety grown in Southern California is the Rome Beauty, with Stark's Delicious, Winesap, and Jonathans second, third, and fourth. Belief was expressed that high-class apples will never glut the markets.

That the Standard Apple Act of 1915 has caused many more apples to be classed as culls; that this loss has brought added profits to the growers; that the 1½c. per box has paid all expenses of inspection so that the State can certify to the grade and size; that 75 per cent of the Watsonville district apples have been inspected and stamped; and that apple growers of the whole State should have a central selling organization to eliminate blind competition and to develop the opening of South American markets were the principal points made by Manager J. F. Jerome of the Watsonville Apple Distributors.

Forkner Cultivator

The yield of alfalfa and grain may be increased, and the quality improved by proper tillage.
The FORKNER Spring Tooth Tillers penetrate and loosen the hard soils, admitting free air to the roots, promoting more rapid and vigorous growth.

Ridding the Farm of Noxious Weeds.

[Editor's Note.—This is the first of a series of five articles on weed eradication that have been prepared by Mr. O. W. Newman, Ass't Sec'y State Commission of Horticulture and which will appear in coming issues of this paper.]

BETTER FARMING — FEWER WEEDS.

The first and most important means of eradication of any weed is cultivation. The first cultivation should come in the fall. The spring cultivation will then kill many weeds which germinate after the fall plowing. Cultivation at all times and wherever possible not only keeps down the weeds, but conserves the moisture by creating a mulch. Harrow grain after it has become well rooted. This has been tried repeatedly and found to be very practical. Wheat, barley, oats, Sudan grass and rye can easily be handled in this way. The weed seeds being a little slower to germinate than the grains, will be in just the right condition to be killed. Use a spike-toothed harrow with as many spikes as possible. Harrow corn before it gets too high and go in later with a hoe and cut out the weeds. The writer has grown corn and tomatoes with weeds and without, and has proved that greater yields can be had without weeds. Weeds take just as much moisture and nourishment as the commercial crop, and pay nothing.

For the average farmer summer fallowing is not a paying practice. Of course there may be cases where it is the best thing to do, but in general summer fallowing is expensive and wasteful of land which could be growing a crop and accomplish weed killing at the same time.

Pasturing.—Pasturing should be practiced in place of fallowing. Fields should be turned into pasture once every four or five years. Several head of stock on a piece of land will remove all weeds except the grasses, which are the only plants able to withstand close cropping. The writer has seen sheep and goats turned into a pasture reduce plant growth to a minimum in a very short space of time. Pasturing is also a valuable phase of a good crop rotation, as it gives the land a rest, adds manure, and gives renewed vigor to the land. If the farmer is careful to feed his stock clean grain and clean hay he will not spread weeds through the manure.

Crop Rotation.—This form of weed eradication is most important. Not only is it a means of eliminating pests, but it is one of the very finest means of renewing soils which are not producing well. Land which is producing good crops is rarely found infested with weeds. Crop rotation is becoming universally recognized as absolutely necessary. The rotations vary with local conditions, but in general a good rotation should cover at least four years and should provide at least one tilled crop, one of clover or alfalfa, and others depending on what the locality produces to the best advantage.

For the eradication of special weed pests such as Bermuda grass, morning glory, yellow star thistle or water grass, crop rotation is invaluable. To get the best results from land covered with Bermuda grass or other troublesome grasses, attach a shear to the front of the plow, which will cut the rootstocks and top of the plant. Plow ten to twelve inches deep, turning the earth over clean. After harrowing rake together and destroy all the rootstocks possible. Sow the field to barley, rye, or some other thick shade crop. It is the shade, as much as anything else, that keeps the grass down. As soon as the grain is harvested plow again and seed to vetch or melilotus clover for a winter cover crop.

In case of yellow star thistle the best crops to use are hoe crops. Plant the land to beets, beans, potatoes, corn or other valuable crops and cultivate with a peg-tooth harrow or cultivator as often as possible, going over the field with a hoe between times.

In all agricultural work, whether it be for weed eradication or other purposes, the word **thorough** should be the pass word. Half the trouble from our insect, fungous, and weed pests could be avoided if the farmers and orchardists would do their work thoroughly.

SPANISH MEASLES OR MILDEW.

To the Editor: My vines show discolorations on canes and the berries get black. Sulphur does not seem to have much effect. Mr. Bioletti has recently mentioned "Spanish Mildew," which he says sulphur does not control. Does it show itself the way I have mentioned? What is the preventive?—A. R. P., Dinuba.

[Answered by Prof. Bioletti.]

[The vine disease, or diseases, known commonly as "Spanish Measles," or "Spanish Mildew," shows usually on the leaves and berries, especially the latter, in the form of small black dots, often very numerous. What its causes are and what its cure are unknown.]

In order to better acquaint peach growers in the San Joaquin valley with the purposes of the California Peach Growers' Ass'n, the officers and directors of that association are holding meetings in the various towns of the valley. They have issued a public invitation to all peach growers, whether members of the association or not, to attend these meetings.

YUCCA MANUFACTURING CO.,
1380 Willow St., Los Angeles, Cal.

Marketing the Canteloupe Crop.

[Written for Pacific Rural Press.]

Probably the most spectacular product of Imperial Valley is early cantaloupes. More folks have gone broke because of "overproduction" before even distribution on the markets was attained; and now the marketing agencies have formed an exchange by which, on a sort of "gentlemen's arrangement," only as many cars are shipped to each eastern city as it has shown itself able to consume without waste, and at living prices for the growers.

The Eastern distributing companies as well as some in the West, contract each autumn with growers for the product of as many acres as they can handle. They guarantee the grower a minimum price of 70 or 80 cents per standard crate and make substantial advances at the beginning of each season. In general, the house keeps 15 per cent of the gross sales and returns to the grower the rest, undertaking to adjust all claims against the railroads for breakage, over-charges, etc.

During the shipping season, usually May 15 to July 15, each house has its representative on the ground. Each morning these representatives meet at the "Exchange" and express their preference of markets for the number of cars each will ship that day.

W. P. Carrol is one of these, representing the United Marketing Co. of Los Angeles. He mentions the figures 20 and 25 as the number of cars Chicago and New York can use daily in normal weather. If more than 20 cars are proposed for Chicago on the Exchange, the secretary apportions the 20 cars among the applicants unless some withdraw voluntarily. Then the remaining cars must go to other markets as agreed upon there, so as to distribute the available daily supply to the markets deemed most likely to pay the best prices, and not to oversupply any one of them.

This system has great possibilities for evil as well as good, and this is the reason that the courts have permitted much prosecution of the Exchange. The Government sent a man to observe its workings last year and protect the growers' interests. According to Mr. Carrol, no significant changes were suggested to the system already being practiced. The latest court decisions seem to have favored the Exchange; and certain it seems that only short-sighted or selfish interests could wish to return to the old days of blind competition.

The efforts of the Government Marketing Bureau, the magnificent system of icing the cars, and the special railroad service, combined with a practical monopoly of the early melons and the working scheme for even distribution ought to permit cantaloupe growers to get the maximum returns for their crops.

GROWING AND STILLING MINT.

To the Editor: I have been interested in your answer to G. W. H., Marysville, about raising spearmint. I have raised a good many acres of mint and also distilled it. I believe tule land would be good for mint—at any rate it should be good, rich soil. Plow and harrow the land well; mark the rows with a single shovel plow about 4 or 5 in. deep. The rows should be 2½ feet apart. Pull your roots and throw them in the marks and cover by trampling. When cutting use a scythe instead of a mower, except on what is called old mint, then use a mowing machine.

Any steam boiler will do for distilling. Have one or two tanks about 6 feet in diameter and 6 feet high with steam tight tops. Have pipes running from the tanks to a tin pipe worm with cold water running on the worm to condense the steam into oil. The tanks must be made of wood. The roots must be good ones of the particular mint you desire to produce.

Repressa, Cal. G. R. Gilkison.

[We must repeat our warning not to get crazy about mint. It is very easy to get too much, and it can be grown all over the country. There was a lot of money lost on mint in this State forty years ago.—Eds.]

The Banning Almond Growers' Exchange finished paying for their fine concrete warehouse in 1915, having taken one cent per pound from the price of nuts handled. Last year ¼ cent per pound was taken to pay for equipment. Meanwhile their membership and tonnage have so increased that only by the prompt shipment of last year's crop and refilling of bins were they able to handle the nuts of members.

John Deere Disc Plows for Tractors

For Field or Orchard

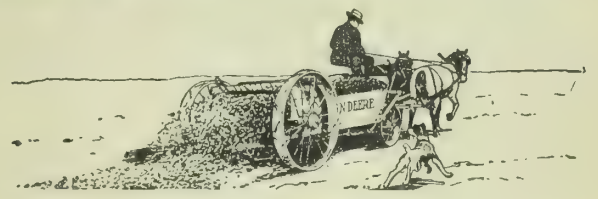
MADE especially for use in the West. Work successfully in every soil where a disc plow should be used.

Plow anywhere from five to twelve inches deep.

One-man outfits—controlled by man on the tractor. Work with any standard tractor.

Can be used either for field or orchard work simply by changing the land axle.

All levers down close to plow when at work—plow can be operated close to trees and under limbs without injuring them.



Easily transported—special lever at the rear for lifting discs high and level.

Over fifteen inches clearance under beam; twenty inches between discs.

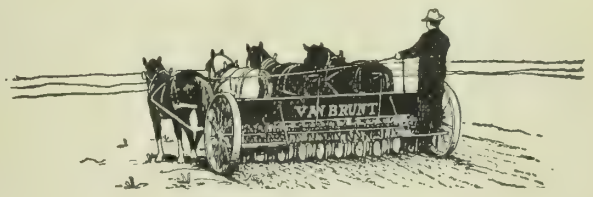
Twenty-four or twenty-six-inch discs with chilled metal bearings—constructed so that bearings do not drag along wall of furrow when plowing deep.

Can be reduced to four discs by taking off one intermediate section and telescoping connecting rods.

Write for free booklets describing the John Deere Tractor Disc Plow No. 10 for field work and No. 11 for orchard and vineyard.

John Deere Spreader

The Spreader with the Beater on the Axle



ONLY hip high to the top. Wheels out of way when loading. Mounting the beater on the axle is patented. Write for Spreader booklet.

Three exclusive John Deere Spreader features:

[1] Beater on the axle—nothing else like it. [1]

[2] Revolving Rake—load moving back to beater revolves the rake. Draft actually less. Even spread certain—no bunching. [2]

[3] Ball Bearing Eccentric Apron Drive—requires no attention. Performs wonders in the working of the spreader. [3]

Van Brunt Drills

With Adjustable Gate Force Feed

THEY plant any small seed, alfalfa to bearded oats, peas or beans. Quantity per acre easily regulated merely by shifting feed gauge levers.

All the ground planted without wasting seed. The Van Brunt adjustable gate force feed and special agitator in the hopper compel seed to leave hopper in even, continuous streams.

An even stand of grain is certain. Pressure springs compel discs to make furrows of equal depth and seed is protected until it reaches bottom of furrow. Single or double discs. Write for free booklets.

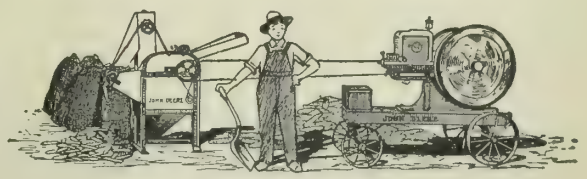
John Deere Plows for Light Tractors

For Orchard and Vineyard

Practical—work with any standard tractor. One-man outfits—controlled by man on the tractor.

No levers—one reason why these plows work so successfully. Plows leveled and depth regulated by screw device. Can be run close to trees and vines without injuring branches.

High and Level Lift—Pull the rope and all bottoms raise high and level. Another pull lets them down.



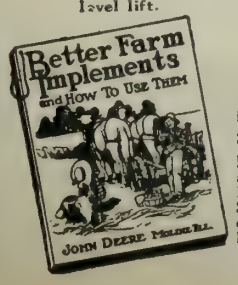
Plows raised in fourteen inches ground travel. Make square headlands.

All bottoms raise high like a double bail, high lift horse plow. You know from experience what this means. Plows do not clog or gather trash on the turn.

Extra wide and semi-floating front truck.

Equipped with either three or four famous John Deere 12-inch bottoms with Quick Detachable Shares—the shares that can be taken off and put on in one-fifth the time it takes to change bolted shares.

Write us for free booklets telling all about John Deere Light Tractor Plows for orchard and vineyard work, or Light Tractor Plows for regular field work—the plows with Quick Detachable Shares, high and level lift.



R. & V. Engines

Dependable Farm Power

"R & V" Triumph—always develops rated horse power—made in 1, 1½, 2½, 4, 6, 8, 10, 12, 16 and 20 H. P. sizes, stationary and portable.

Easily started; perfect speed control (speed can be varied 40 per cent without stopping engine). Complies with insurance regulations. Hopper cooled—a simple, efficient system that does not require long pipes and numerous fittings.

High grade throughout. Inspect the extra guard ring over piston pin to prevent possibility of scoring cylinder. Ask about the "R & V" oscillating magneto. Write for free booklet.

John Deere Dealers Everywhere

Better Farm Implements and How to Use Them

BOOK FREE—168 page reference book—tells all about a complete line of farm implements and how to adjust and use many of them. A practical encyclopedia of farm implements. Worth dollars. Describes and illustrates: Plows for Light Tractors; Steel and Chilled Walking and Riding Plows; Disc Plows; Cultivators; Spring Tooth and Spike Tooth Harrows; Lister Plows and Cultivators; Disc Harrows; Alfalfa and Beet Tools; Farm and Mountain Wagons; Teaming Gears; Manure Spreaders; Inside Cup and Portable Grain Elevators; Corn Shellers; Hay Loaders, Stackers, Sweep Rakes, Mowers, Self-Dump Sulky and Side Delivery Rakes; Hay Presses; Kaffir Headers; Grain Drills and Seeders; Grain Binders; Corn Binders; Gasoline Engines. This book sent free to every one who states what special implements he is interested in and asks for Package No. X-152.

John Deere, Moline, Illinois

General Agricultural Review.

DECIDUOUS FRUITS AND NUTS.

Almond trees are blossoming in many sections and plum trees are reported to be in blossom in Placer county.

The sea-marl limey subsoil of the Paso Robles district gives pome fruits chlorosis, but is good for stone fruits, according to G. N. Talbot.

At the annual meeting of the Kingsburg Packing Company last week a dividend of 12½ per cent was declared and new officers elected.

A heavy planting of deciduous fruits and almonds is expected in the Arbuckle district this spring, there being 1,000 acres already in sight.

Five hundred to 1000 acres of flowers of about 1500 varieties are being planted at the Atascadero colony by the Routzan Seed Co. of Arroyo Grande.

L. D. Batchelor is at Santa Barbara securing scions from walnut trees there that will be used for experimental purposes on the State Experimental Farm at Riverside.

C. K. Wood is one of the orchardists near Yuba City who has been successful with walnuts. He likes the Mayette and Franquette varieties on black walnut root the best.

Activity in the securing of subscriptions for stock in the California Peach Growers' Ass'n is reported from Selma, where even the clerks in stores are said to be supporters of the cause.

Over 4000 young peaches were thinned from a 19-year Lemon Cling tree belonging to F. C. Dyer of Ontario two years ago, and the tree then developed 400 pounds of marketable fruit.

The Ripon Nursery Co. reports the sale of 10,000 almond trees to the Arbuckle Almond Land Co. Stewart Prolific, Nonpareil, Drake Seedlings and Texas Prolific were the varieties purchased.

Peach trees, Tuscans, Phillips, Muirs, and Lovells are the fruits most demanded from the Armstrong Nurseries of Ontario since the rains, for planting within a radius of 30 miles.

Walnuts are to be interset in five acres of Burger winegrapes near Cucamonga belonging to F. W. Whitney, and the other five acres of Burgers are to be grafted to Sultanas.

A walnut grower near Santa Ana argues that the cull walnuts should be cracked and packed at the local packing house instead of being shipped to a centralized plant as is common at present.

Fig growers in the vicinity of Merced have recently sold 70 tons of last year's crop for $172 a ton. A report from there says that the fig acreage will be increased materially the coming season.

It is expected that apricots will be in bloom in Kings county by the first of next week. The buds are swelling rapidly as the result of the springlike weather which has prevailed there for the past two weeks.

It is never any trouble to sell Muir and Lovell peaches from the Cucamonga district to the canners, according to V. G. Lucas, who is handling about 300 acres of peaches over two years old and 50 acres planted last year.

Libby, McNeill and Libby have been making large shipments of canned fruits from their Selma branch recently. They are still at work canning olives and olive oil and expect to increase their output of these next year.

It is the opinion of Assemblyman Boude of Sonoma county that there is a big opportunity for dried Gravenstein apples, provided the apple growers will standardize the dried product in the same manner raisin growers have standardized their pack.

During some winters warm spells start sap to rising in deciduous trees; then cold spells arrest it; there is a sour sap condition which weakens the fruit buds so they may bloom but cannot set fruit which will mature, according to F. C. Dyer of Ontario.

Fred K. Howard, hortcultural commissioner of Kings county, is conducting an experiment on the A. Verkuyl orchard near Grangeville to determine the value of soluble sulphur compounds as compared with commercial lime sulphur for the control of peach blight and curl leaf.

We are advised by T. C. Tucker, manager of the California Almond Growers' Ass'n, that five days after they opened their books for orders for the 1916 crop they were forced to stop taking orders till an estimate of the crop can be made. He also states that it has been some years since prospects were so bright for a big crop as at present. With the 1915 crop marketed a prosperous 1916 almond market is expected.

C. L. Woodbridge of Modesto, who is an experienced walnut grower, says that the mistake so many people make in planting English walnuts in the San Joaquin valley is in the lack of protection afforded the body of the tree from the sun during the summer months. A splendid protection is afforded by wrapping burlap to a height of three feet or more from the ground, depending upon the height of the head. After the first season the bark has become hardened so that it is not affected by the sun.

CITRUS AND SEMI-TROPICAL.

Lime experiments in 14 plots of citrus trees are already started at the new Citrus Experiment Station.

Henry Rickels has purchased a 10-acre grove of young orange trees in the Terra Bella section of Tulare county for $950 an acre.

Every fruit grower in Imperial county should border his fields and ditches with dates, olives, or figs, where conditions are suitable, thinks H. S. Reed.

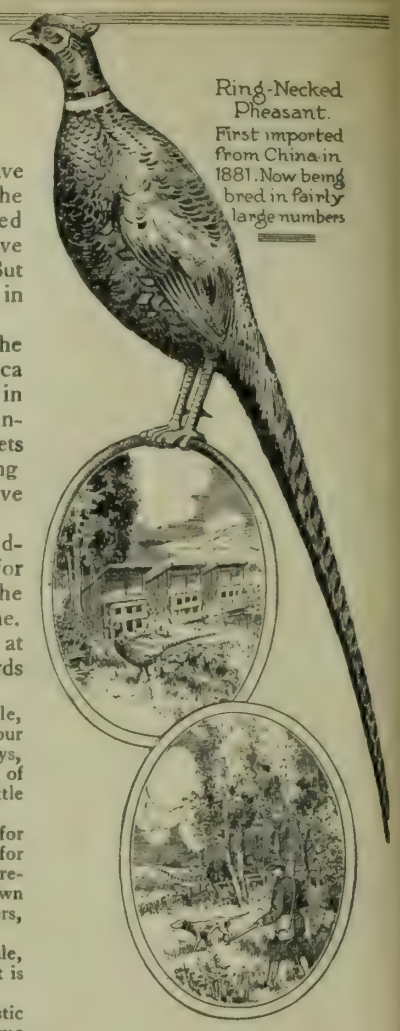
A 50-acre experiment on orange and lemon fertilization and soil treatment is planned for next spring at the new Riverside Citrus Experiment Station.

Revolutionary changes in irrigation methods are predicted as a result of studies now being made of the nitrate plant food movements in the soils.

The navel orange crop south of the Santa Ana river has been harvested, the Exchange having shipped approximately 175 carloads from that district this year.

The first meeting of the Lindsay District Orange company was held last week, when officers were elected for the coming year. The association has a membership of 15 growers.

A report from Santa Barbara county states that the lemons there are not ripening fast enough to keep pace with the demands of the market and that trees are being continually stripped to supply the market.



The Redlands Fruit Ass'n and the Redlands Co-operative Ass'n, both of which sell through the Cal. Fruit Growers' Exchange, are installing precoolers for oranges which will average a saving of $15 per car to the growers according to manager.

Twenty-one bunches of Deglet Noor dates from one tree, each averaging 25 pounds and selling without incubation at 30 to 35 cents per pound, is a record said to have been made in Imperial Valley by Francis Heiny.

Two Deglet Noor date trees 10 years old yielded 430 pounds of fruit last season for F. N. Johnson of Indio, who sold it for $309.30, 212 pounds going at $1 per pound. The rest was second and third grade fruit which sold at 25 to 75 cents per pound.

The division of soil technology will conduct experiments in a Va-

Breed Game Birds on Your Farm

FOR many years, we in America have spent much time bemoaning the disappearance of our feathered game. It is indeed a fact that we have little game to eat and little to shoot. But we can have an abundance of game in the fields and on the market.

The farmers of this country have the land and the enterprise to make America the greatest game producing country in the world. They can supply the ever increasing demand of American markets and American sportsmen by game farming

To you, game farming should prove of interest for three reasons:

It is profitable from a marketing standpoint. The demand for eggs and for breeding stock is much greater than the supply, and will be for years to come. Pheasant eggs, for instance, sell today at from $20 to $25 a hundred. Live birds bring from $5 to $7 a pair.

It will, at small expense in time and trouble, supply you with an abundance of food for your own consumption. Pheasants, wild turkeys, quail, grouse, and other birds forage much of their own food, and require comparatively little attention.

It will provide more shooting for you and for everyone, for it is a fact that game raised for sporting purposes can not be confined in any restricted area. At the same time, those who own large acreage, or who pool their land with others, get profit from those who pay for sport.

Game farming can be done on a small scale, and as a side issue to regular farm work, or it is a profitable occupation in itself.

Women on the farm who are raising domestic poultry, will find it worth while to breed game birds as well.

When conducted on a large scale, a game farm produces sufficient income to be a paying business in itself.

But this subject is too big to be properly treated in this space. Every progressive farmer is sure to be interested in it. Write for the book, "Game Farming for Profit and Pleasure," which will be sent to you without cost. It tells of the subject in a most interesting and informative manner. Fill out the coupon below and a copy will be mailed you at once.

lencia orchard near Porterville this year in search for exact requirements for citrus orchard fertilization and cultural methods. It is estimated that from one-quarter to one-half of the commercial fertilizer on the average orchard is wasted, through improper methods.

The 23rd Annual Citrus Fair held at Cloverdale, February 18 to 22, was one of the prettiest displays ever witnessed by the people of Sonoma county. The pavilion in which the show was held was artistically decorated with citrus fruits and large crowds were in attendance each day and evening.

VINES AND RAISINS.

The low price of wine grapes is attributed as the reason for several wine grape growers in the vicinity of Yuba City grafting over their vines to Thompson Seedless this year.

After the campaign made by the merchants of Fresno and adjoining towns one day last week announcement was made by officers of the Associated Raisin Co. that the 15,000 acres of raisin grapes required by April 1 had been secured, thus insuring the continuance of the company's good work the coming year.

The law prohibiting the shipping of mildewed grapes was upheld in a decision made by Superior Judge J. A. Allen of Visalia last week. The superior judge held that the law was not in violation of the constitution of the state, and upheld the contention of the district attorney that instead of its interfering with the interstate commerce law, it in reality took charge of the grapes before they became the subject of interstate commerce in that the law set forth regulations concerning packing before shipipng.

FIELD CROPS.

The Spreckels Sugar Co. is erecting a beet pulp drier at their plant near Salinas.

Large shipments of grain hay are reported from Hollister, 34 cars being shipped in one day recently.

The Kings County Chamber of Commerce has started a contest in grain growing, prizes for which will be awarded at the county fair this year.

Alfalfa in the Oakdale region of Stanislaus county is several inches high and a big first cutting is expected unless another frost comes before cutting is commenced.

A great deal of alfalfa is being plowed up in Stanislaus county this spring as a result of overpasturing, the late spring rains last year and the heavy rains of two years ago.

As a result of the fine weather which has prevailed in the Delta district of San Joaquin county, practically all of the potatoes have been dug and put in the warehouses.

Farmers near Stratford, Kings county, who planted sugar beets in December were compelled to replant this month on account of the heavy rains which caused the seed to rot.

Rice growers near Colusa are said to be furnishing financial backing to the contemplated rice mill at that place which it is thought will be erected in time for the handling of this year's crop of rice.

According to H. S. Hazeltine, secretary of the California Vegetable Union, there were 2600 carloads of celery shipped from California this year which sold for approximately one million dollars.

A report from Fallon, Nevada, states that it now seems probable that the new owners of the sugar beet company there will be able to secure seed for this year's planting and that as a result the factory will be operated this fall.

Bean growers in the Lompoc section of Santa Barbara county are expecting to materially increase the bean acreage there this year. Everybody has been busy plowing the past two weeks and beet planting is already under way.

Rice growers have filed a protest with the State Railroad Commission against the rate charged by railroads on paddy rice, from interior points to San Francisco. It is charged that the present rate is much higher than the one maintained on grain and articles taking grain rates.

Robert H. Frazier of Modesto says that an old stand of alfalfa should be farmed two years before replanting. It should receive a good covering of stable manure and 250 pounds of acid phosphates to the acre. This can be bought for $17 a ton and helps supply the bacteria necessary for the growth of young alfalfa. He advises drilling 20 pounds of well cleaned and tested seed to the acre and believes it should be planted in March or April.

P & O

Low Down Orchard Disc Harrow

Built especially for use in orchards and vineyards, where with its extremely low frame, it works successfully under overhanging vines and branches. Also adaptable to use in hop yards, on truck farms, opening and closing irrigation laterals, and is an excellent harrow in the open field.

It's the Way We Build Them

The main frame is made of one piece of heavy bar steel formed in a rigid triangle and securely bolted to the tongue. Each gang operated and angled independently of the other and reversible for out or in-throw. Gangs can be tilted either way for ridging up or leveling the ground or for opening and closing irrigation laterals. A large shield over each gang prevents injury to overhanging vines and branches. Bearings have oil soaked, hard maple bushings.

When equipped with the extension frame the discs can be set out to cultivate 11 and 12 foot out-throw and in-throw with an adjustment of 4 feet to and from the center of the harrow, making a running cut from 8 to 12 feet with the extension, and a running cut of 4 to 7 feet with the regular frame. The extension frame is furnished as an extra.

Monarch Cultivator (K)

KILLEFER QUALITY

KILLEFER EFFICIENCY

The Killefer Monarch Cultivator has more varied uses on the ranch than any other tool we manufacture. As a Chisel for bean and beet ground before planting, it has no equal. As an Orchard Cultivator, where deep cultivation is desired, it gives perfect satisfaction.

As an Alfalfa Cultivator, when fitted with our Special Alfalfa Tooth, it does excellent work, loosening the ground to a depth of from six to eight inches without injuring the stand. This deep cultivation enables the water to percolate to a greater depth than any cultivator on the market. Made in 5, 6 and 8-foot sizes.

The Killefer Manufacturing Co.

2209-21 Santa Fe Ave. Los Angeles, Cal.

THE ALPHA AUTOMATIC POWER SPRAYER

Fitted with
THE ALPHA AUTOMATIC PRESSURE GOVERNOR

ELIMINATES unnecessary wear and tear on both the engine and the pump.
THE PUMP STOPS when nozzles are closed. No liquid being pumped except it is forced through the nozzles.
NO RELIEF VALVE or diaphragm for the spray material to corrode and get out of order.
THE AUTOMATIC PRESSURE GOVERNOR is a simple arrangement of a combined lever and spring on each plunger connecting rod, which, when the pressure reaches a predetermined limit, automatically discontinues the operation of the pump without interrupting the driving power, again permitting it to resume operation when the pressure falls below the point at which it has been set.
THIS INSURES SAFETY, secures uniform pressure and eliminates unnecessary wear (no liquid pumped except it passes through the nozzles), the pressure relief is not dependent on the operation of a sluggish or defective relief valve, but is positive and mechanical, thus making it impossible to run the pressure up to the danger point.
BUILT IN ALL SIZES from a 2x3 inch pump and a 150-gallon tank to a 2½x3-inch pump and a 200-gallon tank. (Either Duplex or Triplex).

Send for catalog and prices.

Mechanical Power on the Farm.

POWER LAND LEVELING.

[Written for Pacific Rural Press.]

Wholesale land leveling is the pleasure of W. L. Hodges on his recently acquired ranch near El Centro. A Yuba 18 tractor pulls a Schmeiser Jr. Land Leveler, about the only one yet in the valley. A man must pay attention to the tractor all the time, for when the leveler gets full of dirt, the engine requires more fuel. It smooths off an eight-foot strip at a time in fine shape.

The leveler is composed of an iron frame hung behind the tractor with two four-foot wheels to carry its weight behind. In front of the wheels is the scraper, a vertical sheet of heavy iron three feet high and eight long, with a steel cutting edge and with wings to project forward several feet. The scraper is raised and lowered by compressed air.

The compressor is set on a bracket shelf bolted to the tractor frame just above and in front of the left track. A belt from the engine pulley wheel runs it and forces air through a coupled rubber hose and a fixed iron pipe, to the air tank behind the scraper but in front of the operator's platform. From this tank, the air passes by a pipe to a pressure gauge, safety valve, and handvalve. When the handvalve is turned one way, air passes into a vertical cylinder from the bottom, and forces the piston upward. The piston works a lever on a rotating axle which extends across above and back of the scraper. The short arm of the lever forces the scraper down into the dirt and is helped by a fixed arm near the other end of the axle. Turning the handvalve the other way lets air into the cylinder from above, forces the piston down and lifts the scraper. The wheels, being behind the scraper, are always on leveled land. A bump in front of the scraper is cut off and carried along until a depression is encountered and filled, or until the scraper is lifted at the low part of the field.

AUTOMOBILING CHERRIES TO MARKET.

[Written for Pacific Rural Press.]

The popularity of Beaumont Tartarians is attested by the statement of Cecil Grigsby that last season there was a line of automobilists waiting almost every day in the season to buy them at the Highland Home ranch for 10 cents per pound. The travelers had to turn off the Riverside drive a couple of miles and back to get the fruit. Mr. Grigsby says they sometimes sold over $50 worth in a day.

The automobile also helped to market several tons direct to the stores in Redlands. They would load up as much as 1000 pounds at a time on their trips to town. Many of these cherries were sold at 12½ cents alongside of northern Tartarians which sold at half the price because not so large or fresh.

CAUSES OF CARBON DEPOSITS.

If the amount of air entering the carburetor is not sufficient to insure complete combustion, we have what is known as a rich mixture, says a bulletin on carbon deposit and its causes, issued by the Standard Oil Company. This is a slow-burning mixture rather than an explosive one, and will cause excessive carbon deposit.

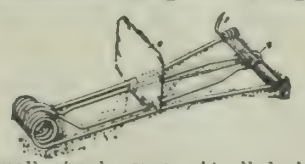
For example, if the wick of an oil-burning lamp is turned too high, too much oil will be siphoned through the wick for the amount of air entering the lamp to form complete combustion. The lamp will smoke, and soot, which is carbon, will be deposited on the chimney.

This is exactly what happens in the cylinders of a gas engine. The products of incomplete combustion of the gasoline deposit a certain amount of carbon in the combustion chamber. This carbon deposit will build up very much more quickly if it has a bed to build up on, such as would be produced by a lubricating oil which, when exposed to the heat of explosion, would leave a gummy deposit.

Lieut. G. S. Bryan, U. S. N., has ably and correctly pointed out in his article on "Motor Cylinder Lubrication" that lubricating oils manufactured from paraffine crude oils deposit more carbon than lubricating oils manufactured from asphaltic base crudes. The reason for this is that paraffine base crudes contain paraffine wax which cannot be entirely eliminated from the manufactured product.

SAWS ORCHARD PRUNINGS.

[Written for Pacific Rural Press.]



In many old orchards there are trees with much dead wood which is shading and smothering new growth, besides many trees that are dead from decay or crown gall. Such an orchard was not long ago cleaned out by Paul Davis of Banning and many cords of wood piled up. To cut this hard, dry orchard wood he has a 6 h.p. Fairbanks-Morse engine mounted on a plank platform with a circular saw of the same make fixed with a heavy flywheel, on a frame of angle irons. The whole outfit can be moved at pleasure.

AUTO RUNS SILAGE CUTTER.

[Written for Pacific Rural Press.]

Knapp Engine Disc Plow

With this plow you can work within one foot of the trees in throwing the soil from the trees. Built very low, so that no part can come in contact with the limbs of the trees. Will penetrate hard soil and will not jump or swing round. Will turn under and completely cover up any cover crop or foul growth NO MATTER HOW HIGH OR HOW THICK.

WILL NOT CLOG UP IN PLOWING BUR CLOVER OR VETCH, as it has a wide clearance.

NO LEVERS to come in contact with limbs, as the land and furrow wheels are provided with worm-gear lifts, which does away with the levers and makes the plow easy to raise or lower.

TURNS EITHER TO RIGHT OR LEFT, and is steered by the engine as well as by hand.

The seat is in the center of the plow to keep the driver away from the trees, and all operating rods are within easy reach from the seat.

MADE IN ALL SIZES to suit every size and make of tractor.

cutter connected by a jack shaft to the hind wheel of a little automobile," says F. H. Vander Poel of Imperial county.

"We kept a ¾-inch stream of water running into it all the time, and it makes the finest kind of silage. The short cutting makes it pack better and increases the silo tonnage."

FAST SEEDBED PREPARATION.

[Written for Pacific Rural Press.]

Cotton follows corns on 320 acres of the W. Deering ranch near El Centro. The corn was well pastured down by the middle of January. A 60-65 Caterpillar was hooked to seven 14-inch plows, behind which was a disk and a spiketooth harrow, turning and working down the soil at one operation without ever running on plowed ground. The last 80 was somewhat sandy land, the rest of it more mixed with adobe. The heavier land had been fined two or three inches deep by a weighted 16-foot double disk pulled by the engine before plowing. This cut the stalks so that they did not interfere with plowing. It disked 40 acres a day at a cost of 50 cents an acre so that the hardest 80 turned over "like a garden." Rain prevented disking the softest 80 and what few stalks were left required continual stopping to clean them from the plows. There was plenty of power, even in the rod or two of Bermuda grass which bordered the fence. Two plows were broken, but the outfit was kept going, and with only five plows, turned, disked, and harrowed 30 acres per 24 hours.

The engine was rented, at $15 per day. One man was required on the engine, another on the plows, and another man was useful when stalks stopped the outfit by lifting the plows out of the ground. Where the land was previously disked, it cost $2.25 to $2.50 per acre for engine rent, fuel, oil, and wages to plow, disk, and harrow, using two shifts of 12 hours each, to rush the work along.

Each plow was hitched independently to the diagonal side of a triangular frame of 5-inch angle irons. Each plow was preceded by a wheel to regulate depth, and by a coulter. When stalks did not hinder, they plowed about five inches deep. The engine disk was double, the fore part being angled backward from end to center, while the rear part was angled forward and the disks set facing the opposite direction.

The fast plowing enabled Mr. Deering to get full benefit from his cornstalks and also to wait till millions of weed seeds had germinated.

WANTED MOVABLE POWER.

"We've been choping most of our hay," said J. N. Huston, who is interested with his son in a large dairy near Imperial, including over 100 head of pure-bred Jerseys. "We use a Bull tractor, and Ohio Monarch cutter which handles 20 tons a day. The only trouble with the cutter is that it lets so much chopped hay drop underneath that the conveyor would get choked if we didn't keep a man to clean it out.

"We have a 5-h.p. gasoline engine, a 5-h.p. steam boiler, and a 10-h.p electric motor, but we got the tractor largely with the idea of having power that we could use in various places without hitching up a team to haul it around, besides starting the engine.

"We will use the tractor on a 3-inch pump to take liquid manure from the cesspool which will receive drainage from the stables. We will also use it to pump whey and skim milk at the hogpens out of a 1500-gallon cement cistern, which now receives the wastes from the dairy by gravity.

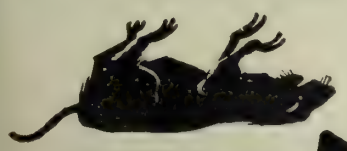
The tractor is a 22 h.p engine. Of course not nearly all the power is used in pumping, but the extra strength is available when we want it for any of the numerous heavier tasks about the ranch, and it didn't cost much more than a smaller one."

TRACTOR HAULS 30 TONS.

A road tractor beats the cars in hauling hay from Chino in San Bernardino county to Los Angeles, 39 miles by rail.

A. J. Spohn of Inglewood, who does hauling on a large scale, recently took a man and six hay wagons to Chino empty to haul back 30 tons of hay. He figured the round trip would take about three days, and would cost about $40 for his time, hired labor, oil, and gasoline. The engine is rated at 60 h. p. but Mr. Spohn says it develops 90 h. p. and hauls 30 to 50 tons on the ordinary paved country roads of Southern California.

PUMPING AGAINST BLIGHT.



[Written for Pacific Rural Press.]

Irrigation for walnut blight control is to be the next experiment of Robert Main on his orchard near Goleta. Last fall he dug a well 455 feet deep with a 12½ inch casing all the way down. In the test pumping. a 75 h. p. Caterpillar engine pumped it several days 10 to 12 hours per day, but did not dry it out.

Mr. Main has been co-operating with the University several years in experiments for control of blight by pumping, spraying, and manuring, but last summer, perhaps a third of the six-ton crop blighted. The disease was very prevalent at Goleta last season.

Examine the connections on coil and batteries.

. Keep the connecting rod bearings tight.

KILMOL got him

One squirrel or gopher can do more damage for his size than anything on four legs. But Kilmol gets 'em every time—no uncertainty—a *sure* way at last.

KILMOL
SQUIRLGOPHENE

Will Kill 'Em All

Simply saturate a waste ball with Kilmol, put *one* ball in tunnel, ignite in from 3 to 5 minutes. The deadly gas does the rest—does it *quickly*—one treatment is enough. Results absolutely guaranteed or money refunded. Government, State and County officials use Kilmol. **Ask your local dealer** Write for information on squirrel and gopher eradication.

Dept. B.

Not Acreage But Production is the True Measure of Profit

Profit is the difference between what your crops cost you and what you get for them. The ratio is the same whatever the acreage of the farm.

The farmer who can cut down cost and increase production is the one who will make the most money on his investment.

G-E ELECTRIC MOTORS FOR RANCH AND FARM

will positively accomplish the following results:—

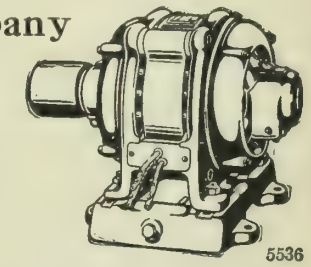
Save loss from drought and increase crops by supplying steady, dependable power for irrigation.

Save labor by driving farm machinery formerly worked by hand.

Save repair bills—owing to their simple, sturdy construction, G-E motors operate for years without getting out of order.

Save time,—G-E motor-driven machinery does job or "chore" in a fraction of the time taken by slow hand methods.

Ask your local power company to demonstrate what electricity will do for you in the house, dairy, barn and field.



General Electric Company

CO-OPERATION OF TABLE GRAPE GROWERS.

A very instructive lesson in co-operation is found in the success demonstrated by the San Joaquin County Table Grape Growers. At their recent annual meeting a dividend of 20 per cent was ordered paid on the stock issued to growers forming the association. Since organization the stock has trebled in value, this valuation being a standing offer from the association to any of its members desiring to dispose of his stock. This dividend comes after the association has paid out $5000 for a site for its packing shed and also paid a tonnage dividend to all of the members who shipped their grapes through the association last year.

Upon organization several years ago the growers immediately got busy improving the table grape product. In a very short time the standard of the fruit was the highest, intelligent cultivation, picking, packing and distributing having been brought about through inspections and general educational activities entered upon collectively and individually. As a result of the co-operative effort of the table grape growers of the Lodi section many of the eastern markets have come to accept shipments from that district without question, having learned of the standardization insisted upon and the rigidity with which all inspections are made before the stamp of approval is placed upon them.

At the last annual meeting the following directors were elected: G. W. Ashley, A. S. Lasell, W. C. Brown, Richard Lower, Henry Pope, E. A. Benedict, W. S. Clark, Dan W. Bird and H. J. Couper. After the election the new board met and organized, electing the following officers: G W. Ashley, president; A. S. Lasell, vice-president; W. C. Brown, secretary. Last year was the most prosperous year in the history of the association, and besides paying the above dividend the association still has a good working capital in the hands of the treasurer.

ALMOND GROWERS PLEASED WITH ASSOCIATION.

To the Editor: The annual meeting of the Arbuckle-College City Almond Growers' Association, a unit of the California Almond Growers' Exchange, was held in Arbuckle February 12th, with a majority of the tonnage present.

The members expressed themselves as being well pleased with the work of the Association, giving the Directors full power to erect a warehouse for the Association at that point. The following resolution was also passed:

Resolved: That we deprecate the demoralizing tactics now employed by almond speculators in guaranteeing to cut any association price, and that we urge the almond growers not members of the Exchange to co-operate at once through that medium for our future safety in the maintenance of price and development of markets.

Hundreds of acres of almonds are being planted this spring at Arbuckle, which with the present acreage that is bearing, will make this section one of the most important almond sections in California.

San Francisco. T. C. Tucker.

About 125 acres of shipping plums will be planted in the vicinity of Oroville this year as a result of a widespread agitation that was started last fall.

Right to the point

At this season of the year, the most important point in farming is to secure a tractor that stays on the surface of the soft soil.

Owing to the Ball Tread, the Yuba works on ground that is too soft for horses—and with angle irons bolted to each alternate tread, the pressure per square inch is further reduced by thirty per cent.

And now—

Right to the point—The Ball Tread is an exclusive Yuba feature—protected by patents. It is the secret of the Yuba's economical operation under every condition encountered in farming—in the mud—on the side of a hill—or in the sandy orchard.

The catalogue explains why—write for it.

Imperial County's Dairy Opportunity.

(Continued from page 249.)

pay a premium for Grade A cream beginning February 1, no cream is coming in now that would qualify under Grade A."

This corportion has recently effected a sort of coalition with a statewide creamery company which has been a pioneer in cream grading, and whose product has become known as of the best. The Imperial Valley butter will be sold under the brand which this company has made popular by years of expensive, painstaking effort; showing the faith of professionals in the possibilities of butter from this valley. They foresee the absolute necessity of selling California butter, in the East, and are preparing to make that which will compete there with fresher butter from Eastern States.

To get cream in the hot months, from which worthy butter can be made, there are alternatives, and the creameries will take advantage of both. A few progressive dairymen with the required capital are milking their cows in covered open-sided barns with wood or concrete floors, are using milk coolers, and sterilizing separators and milk utensils with steam. There are even a few who are operating milking machines.

From such, the creameries will collect cream daily by auto trucks and by the short railway lines in the valley. There are many others who milk in open corrals the year around who also will produce cream which can command the premium to be paid for Grade A.

From the rest, an effort will be made to collect whole milk once or twice daily by trucks. Then, if bad butter is shipped, the creameries will have to take the blame. They are willing. They also report that the whole milk proposition meets favor with most of the dairymen, who in Imperial Valley do not so generally have hogs to use the skim milk, which is now thrown away. If they wish, it can be returned to them sterilized and safer for the hogs. Many are from Humboldt and other sections already accustomed to selling whole milk.

Other Dairy Outlets.—The creameries taking whole milk will open another outlet for dairy products. A casein factory is nearly built in El Centro, and in time, a milk sugar factory will be built to save this product, which until then will be wasted. Other outlets are cream for Los Angeles, and cheese, though the cheese produced in the valley declined from 185,000 pounds in 1914 to 61,000 in 1915.

Open Barns.—The valley is unique in its rainlessness and heat. The best shelters have no sides, and the roofs are either of galvanized iron or of hay, cornstalks, etc., on a frame high enough for breezes to pass under. The iron roofs beat through sooner, but are fireproof and cool quickly with evening breezes, while the hay roof might burn quickly, and holds heat later at night, though it keeps the day's heat from people and stock under it. Corrals seldom get distressingly muddy anywhere in the valley, and are easily fixed with sand, which does not usually need to be hauled far. Imperial Valley's dairy opportunity is wonderful. Over 300,000 acres are fully supplied with cheap water which, in being used, constantly adds fertility to the land. Half as much more is likely to be irrigated. Practically all of it is adapted to alfalfa, barley, and sorghum corns. Barley is usually sowed in the alfalfa to provide winter pasture. Where barley is sowed alone, it is followed the same season by a crop of milo. Cottonseed meal is more available there than elsewhere in California. Trees grow faster there than elsewhere. Shade and shelter are cheaper than elsewhere, the cattle stay out of the sun in summertime, mostly grazing at night. With so large a community, all feeding practically the same feeds, grown on their own farms, making complete balanced rations, including succulence the year round, with shelter so cheap, and with cream-grading, whole milk receiving creameries, there seems every reason why Imperial county should lead all others in quantity of dairy products, in cheapness of production, in uniformity of quality, and in market demand.

As a breeding center, there is every opportunity to make this section as attractive for special trips of prospective buyers of pure-bred stock as Wisconsin now is. Community breeding and community advertisement of the stock could here be made uniquely successful. The few pure-bred herds now in the valley furnish widely scattered nuclei for the spread of pure breeding if the owners of these herds shall realize the advantage of anthentic records and persistent advertising. Such records should show cheaper cost of dairy production by pure-breds.

TUBERCULOSIS HOGS A HEAVY LOSS.

[Written for Pacific Rural Press.]

Cholera is generally supposed to be the most costly disease to the swine industry of this State, but it has a very able ally in tuberculosis, as is shown by reports of the U. S. Meat Inspectors at one of the largest packing plants in San Francisco.

During one week in January, 1916, this company killed 3,085 hogs, of which 31 were condemned on account of being tubercular, two because of cholera, one on account of pneumonia and two because of septicamia. There were also 328 hog heads condemned the same week on account of tuberculosis. From this report it will be found that 1.17 per cent of all animals slaughtered were condemned on account of tuberculosis, while 10.63 per cent of all the heads were condemned for the same reason.

This loss, while apparently borne by the packers, nevertheless, comes out of the producers' pocket in the final analysis as it represents a portion of the middleman's cost of operation.

The reason for the heavy percentage is directly attributable to the feeding of raw skim milk from tubercular cattle and may be readily overcome by heating all milk to a temperature of 150 degrees before feeding. This may either be done in a large vat, with a fire underneath or by turning steam into the milk from the boiler in the separator house.

It is a loss which should command more attention by skim milk feeders at this time as it is affecting the buying of hogs in dairy sections, and may, if the condition gets worse, place the skim milk hog in the list of undesirables, similar to the "acorn hog" at the present time. This should not be, as good skim milk is too valuable a hog feed to come into bad reports through careless methods

BALANCED RATIONS FOR COWS.

To the Editor: I would like a balanced ration to feed my cows to get the best results. One cow is 7 years old, ¾ Jersey giving 4 gallons, 5 per cent butter fat per day; one is 3 years old, ¾ Jersey, giving 4 gallons, 5 per cent butter fat; one is 2 years old, ½ Holstein, ¼ Jersey, giving 3 gallons, 4 per cent butter fat. All in good condition being fed 8 pounds bran and 2 pounds oil cake meal per day, with alfalfa hay. Feed can be procured as follows: bran $1.50, middlings $1.90, ground barley $1.70, cottonseed meal $2.00, oil cake $2.25, beet pulp $1.20 cwt. I have alfalfa hay and a little green pasture.—S. C. M., Sonoma.

[Answered by Professor F. W. Woll, University Farm, Davis.]

[The correspondent is feeding altogether too much protein for best results, both so far as the cows and their production and his own pocket book are concerned. All three feeds given in the ration of the cows are high in protein (flesh-forming substances), and instead of 2 or 2½ pounds of digestible protein that good dairy cows like these require, he is supplying over 4 pounds, and the nutritive ratio (proportion of digestible protein to starchy components) is 1:3.3, while it ought to be 1:5 or still wider; furthermore, both concentrated feeds are expensive, and the price of oil meal even prohibitive. Of the grain feeds given, dried beet pulp and ground barley are the cheapest ones that can be fed to advantage with alfalfa hay. Both these feeds are high in carbohydrates (starchy components) and, therefore, make excellent supplementary feeds for cows on alfalfa hay. I would suggest giving a grain ration of dried beet pulp 2 parts, and barley 1 part, by weight. This would be further improved by feeding some cocoanut meal, which costs no more than barley, as a general rule, and being aromatic and high in oil, increases the palatability of the grain ration. If cocoanut meal is available, a mixture of beet pulp, barley, and cocoanut meal in the proportion of 3:2:1 by weight, will make a very effective ration, with alfalfa hay fed as roughage—one pound of this mixture for every five pounds of milk produced by the cows whose milk is as high in butter fat and solids as that of these cows.]

Larrowe's Dried Beet Pulp

—is a valuable feed from many standpoints.

—It gives an instant increase in milk flow of one to five lbs. per day from each cow. It is succulent, clean, wholesome; aids digestion and has a gentle tonic effect on the system. A diet of Alfalfa and Larrowe's Dried Beet Pulp supplies the correct proportions of protein and carbohydrates to keep your cows in perfect trim.

Order From Your Dealer

—a single 100-lb. sack of Larrowe's Dried Beet Pulp—either plain or with molasses—and test it on one cow whose milk record you know.

Should He Try Cross Breeding?

To the Editor: I have a thoroughbred Jersey cow. I thought of breeding her to a thoroughbred Holstein bull. Do you thing that would be a good cross or would you breed her to a thoroughbred Guernsey bull?—Reader, Santa Cruz.

[The word thoroughbred should not be used in reference to dairy cattle any more than you would say "Berkshire Jersey cow," as thoroughbred is the name of a breed of running horses and does not signify pure breeding in other kinds of livestock.

As to whether you should use a Holstein or Guernsey bull to breed your cow to if she is a purebred Jersey, we should say neither, that is if you are expecting to raise the calf for dairy purposes. The chance of variation is so great when animals of two distinct breeds are mated that you cannot afford to do it unless as an experiment. It would be far better to breed her to a purebred Jersey bull.

Of course if you don't care for the characteristics of the Jersey, and want to spend some years in building up a grade herd, having the characteristics of one or the other breeds mentioned, you should breed to a bull of the breed you prefer and keep at it till you have the Jersey blood about bred out and the other breed, bred in. The characteristics of the the Guernsey and the Jersey are more nearly the same than those of the Holstein and Jersey, but we can't decide for you which one to choose. Make up your mind which one best suits your tastes and needs and act accordingly.—Editors.]

CONCRETE SILO CONSTRUCTION.

To the Editor: I am thinking of building a silo 16 by 30 feet and want to build it the cheapest and best. I have sand and gravel in abundance a quarter of a mile from my barn. Please state through the columns of the Press about cost and what proportions of moisture the concrete should have, and in your opinion are they cheaper than a wooden silo. The complaint has been made, with all that I have seen, that there is too much waste around the sides of cement silo, but no doubt they have learned to overcome that. —A. L. M., Stoneyford.

[A concrete silo the size you indicate would require about 51 barrels of cement, 14 cubic yards of sand and 28 cubic yards of gravel if the mixture were one part of cement, two of sand and four of gravel, which is the right proportions for silo construction. We cannot tell you exactly how much water to use, but in a general way would say that if the mixture is too dry, there will be porous places that will admit the air and on the other hand, if the mixture is too wet the sand will run, leaving the gravel without enough cement to prevent cracking and to exclude the air. The success or failure with a concrete silo lies largely in this very part of the construction; and unless you have had experience in handling cement or can secure a man who does know, you had better decide on a wooden silo.

It is true that a concrete silo is the most permanent, if properly constructed, but the initial cost is considerably more than a wooden one, and as you have found by inquiry, there is more danger of them being unsatisfactory, on account of the above reasons.

The cost of constructing a silo the size you mention will vary according to the material used for reinforcing and the utilization of the forms used. We have no definite figures at hand as to cost of construction, but would say that the cost would run $400 to $500 for the size silo you mention, which is considerably more than the cost of wooden silos. A discussion of this point by subscribers having had experience would be of interest at this time.—Editors.]

EGYPTIAN CORN FOR HORSES

To the Editor: Is ground Egyptian corn as good a feed for horses that are working this time of the year as rolled barley? Would it be good to feed to milk cows with alfalfa hay?—W. F. P., Turlock.

[Answered by Professor F. W. Woll, University Farm, Davis, California]

[Egyptian corn or White Durra does not differ greatly from barley, either in chemical composition or digestibility. Its feeding value is generally estimated to be somewhat lower, viz., about 90 per cent of that of barley. Like Kaffir corn, it is often fed in the head to stock. It may be fed to horses in this way or coarse-ground. While it may be considered nearly as valuable as rolled barley for working horses, it is likely that a mixture of equal parts of the two grains would be relished better than either grain fed alone; at any rate, better than Egyptian corn alone; this applies to cows as well as to horses. Both the grains given make excellent supplement feeds with alfalfa, as they are high in carbohydrates and low in protein. while alfalfa is a high-protein feed.]

BREWERS' GRAIN FOR DAIRY COWS.

To the Editor: Will you tell me how to feed brewers' grain to dairy cows and also its value as a feed to dairy cows?—C. E. S., Chico.

[We presume you mean the wet brewers' grains as they come from the breweries. This is an excellent feed for dairy cows, when fed in a sanitary manner and in the right amounts. It should be fed with dry roughage and some concentrates, in which event as much as 20 to 30 pounds daily per cow may be used. Prof. F. W. Woll, in his book, Productive Feeding of Farm Animals, states that the wet brewers' grain may be considered worth about one-fourth as much as the dried grains, which compare favorably with barley as a feed to dairy cows. Care should be taken to keep the mangers clean, to avoid foul odors which will arise when brewers' grains are fed otherwise.—Editors.]

TELLING AGE OF COWS.

To the Editor: Kindly inform me how to tell the age of a cow.—C. I., Lathrop.

[If the cow has horns, you can tell after the third year by the rings on the horns, which first appear when the animal is three years old. one being added each year afterwards. You can also tell by the teeth as with horses, in this manner: The central incisors are found at birth, the internal lateral at one week old, the external lateral at two weeks and the corner incisors at three weeks. Their replacement by permanent incisors are about as follows, though there is more variation than with a colt: At 12 to 18 months old the central incisors are replaced, the internal laterals at about two and a half years, the external laterals at three to three and a half years and at about three and a half years the corner incisors.—Editors.]

REMCO
REDWOOD PIPE

All diameters from 2 inches to 12 feet. Much cheaper than any metal pipe. Will carry 30 per cent more water than metal or cement pipe of same diameter. Will outlast any metal pipe except cast iron. Cannot be injured by roots or displacement. Furnished for any pressure from 0 to 400 feet, and guaranteed for 100 per cent overload.
Write for further information, prices, etc.

REMCO
Redwood Tanks

Cheaper than metal tanks. Last longer. Cannot rust. Not affected by chemicals in water. Thousands in use in the West.

We make them in all shapes and sizes, from 200 gallons to 500,000 gallons.

"THE NAME GIBSON INSURES QUALITY."

Cactus or Alfalfa for Hogs?

To the Editor: Which is the best feed to grow for hogs, alfalfa or cactus? I have three acres that I would like to plant as I intend to raise quite a few hogs. Also the style of house that would be best for, say, 10 sows, also size of runs, and would cement floors for their sleeping quarters be best?—J. W. N., Livermore.

[Answered by Elmer Lamb, Ceres, Stanislaus County.]

[Three acres will not supply the green feed for any great number of hogs. However, it can be made to serve for the 10 sows your subscriber speaks of and their litters till weaning.

Cactus will not take the place of alfalfa but will be an excellent feed for the hogs after the frost has killed the other green feed. I value cactus chiefly for its succulence; as an appetizer and conditioner.

The great problem in winter, with all livestock is to get them to consume enough water to keep all of the organs working properly. As cactus is 90 per cent water and as all stock eat it with a relish when accustomed to it, it supplies a large per cent of the liquid to keep the bowels loose and the digestive tract in tone. In your subscriber's case I think I should plant half an acre to cactus (the Anacantha variety) and the rest to alfalfa. Feed the cactus when there is no green feed and along with alfalfa.

A very convenient hog house can be made, arranged with a four-foot alley through the center—with pens on either side. The nest rooms should be made eight feet square. That would require the building to be 20x40 feet. Cement floors are the cheapest but require plenty of bedding in the winter as they are very cold for small pigs. In the summer they are cool and pleasant and also more sanitary than board floors.

While I never used it I believe asphaltum would make the ideal floor. A run the width of the room and 30 or 40 feet long, arranged with feed trough at the far end, will be all right, supposing, of course, that the sow will have access to pasture.]

[We might add to the above that it is a wise practice to have a movable wooden floor to be placed on top of the concrete floor of the farrowing pen, as many breeders complain of losses of pigs, where the sows in pig sleep on the cold and hard concrete floors.—Editors.]

BERKSHIRES IN MENDOCINO COUNTY.

[Written for Pacific Rural Press.]

The Berkshire swine herd of 96 head on the Hopland Stock Farm is beginning to assume greater importance in livestock operations on that ranch. The foundation for this herd was laid two years ago with five sows and is now headed by the boar Royal Pointer 2nd. This boar was sired by Star Premier Master, having been shipped from Wisconsin after securing awards there at the State Fair.

Ground barley, ground alfalfa, and tankage, together with alfalfa and stubble pasture comprise the ration for hogs. Careful record is kept of everything in connection therewith. One interesting item, taken from the records, shows that for the past two years the sows have averaged two litters every 13 months, seven pigs of each litter having been raised.

A report from the east states that Truman's Pioneer Stud Farm has just sold the Shire stallion, Boro Blusterer, and 17 registered mares to Hawthorn Farm, Illinois. The stallion was first in the aged stallion class and grand champion stallion at the P. P. I. E. His stable mate, Stow Royalty, was purchased by E. W. Westgate, Jr., of Rio Vista, as stud sire for his Shire herd.

Agreed

Many leading gas-engine experts have recently declared that lubricating oil made from asphalt-base petroleum gives best results.

Pacific Coast motorists made the same discovery years ago. For the majority have been using Zerolene in preference to all other oils. They agree with the experts.

Zerolene is made from selected California petroleum—asphalt-base—under the unequalled refining facilities of the Standard Oil Company.

Next time you empty the crank case, refill with Zerolene.

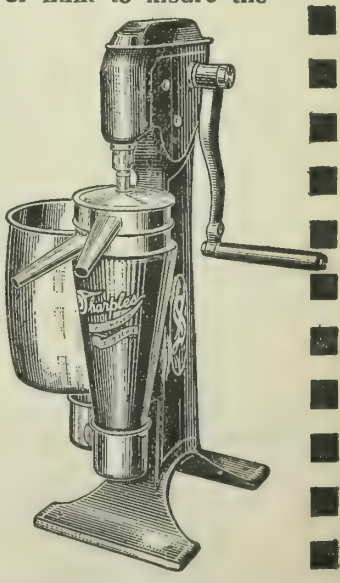
More Dairy Dollars

We have found a way to bring you more dollars without increased expense. We call this new profit "velvet," because it comes so easily. Our new book, "Velvet for Dairymen" tells all about it.



Your separator is losing cream, no matter what the make. A famous experiment station says, "*The use of the gravity can, a low speed of the separator, and an excessive rate of inflow cause heavy loss in butter fat.*" They have proven that 95% of all farm separators are turned below regulation speed. When the speed slackens, a lot of the cream escapes with the skim milk—and with the cream goes the profit.

The annual loss from imperfect separation is $47 on the average farm and upon many farms it is $100 and more. That's the tax you pay because you can't turn your separator at just the right speed all the time. But with

THE NEW SHARPLES SUCTION FEED

Separator you get all the cream at any speed.

A wonderfully simple invention enables the bowl to *drink in just the right quantity of milk* to insure the closest possible skimming. You may turn slow and make the work easy or you may turn fast and get through quicker. You simply won't lose cream with the "Suction Feed."

You get smooth cream of an even grade whatever the speed of the separator. Uniform cream makes fancy butter that brings top prices.

The supply can is only knee-high. There's no hard lifting to empty heavy milk cans.

The new machine has all the features that have made the Sharples Tubular famous and many other new vital and exclusive features found in no other separator.

Send now for our new book, "Velvet for Dairymen," and learn how to secure this new dairy profit. Address Dept 31.

DAIRYING.

B. E. Nixon of Napa county has received 22 head of registered Guernsey cattle from the east lately.

E. B. McFarland of San Mateo county has recently received a carload of purebred Ayrshires from Canada.

F. J. Austin has been in the Modesto district purchasing 200 head of Holstein calves and heifers for shipment to Utah

The Dairymen's Co-operative Creamery company of Tulare paid out $46,127 for cream received during January.

California ice cream manufacturers recently held a two days' convention at Fresno, where new officers were elected for the coming year.

The average amount of cream received annually by the Salinas Creamery is about 732,000 pounds, while the average amount of butter fat is 264,000 pounds.

The cow De Kol Pietertje's Favorite Queen 2nd, owned by the State Industrial School, at Whittier, has finished a year's record as a 10-year-old with 711.56 pounds of butterfat.

The Dairymen's Co-Operative Creamery company of Tulare have decided to erect a new plant having a capacity of 16,000 to 20,000 pounds of butter daily. The building will cost about $20,000.

Creameries in Kings county paid $146,000 for cream received during January. It is expected that 1916 will show a material increase in the income from dairying in that county over last year.

Ten dairymen in the Petaluma district were arrested recently by an inspector of the State Dairy Bureau on charges of unsanitary conditions around their dairies. Most of them pleaded guilty and paid fines.

The Visalia creamery paid out for the January cream deliveries a total of $21,000.75. The creamery received 202,800 pounds of cream, from which 65,600 pounds of butterfat were produced, making a total of 81,000 pounds of butter.

The Porterville Co-operative Creamery has purchased the Sunflower Creamery at Poplar, Tulare county, and hereafter all business will be done under the first named company. Chas. O. Premo will continue in the capacity of manager.

W. S. Carpenter, who has a large cheese factory at Carruthers, is building a modern factory at Salida. It will have a capacity of 2400 pounds of cheese a day. The milk from 1400 cows has been contracted for. Cheddar cheese will be made.

Artis Belle King, a registered Holstein belonging to A. R. Anderson of Modesto, has recently finished a 365-day test with 515.47 pounds of fat as a two-year-old. Her seven-day record at calving was 10.47 pounds of fat and at nine months after freshening 9.164 pounds, which shows her persistency.

A report from Sheboygan, Wisconsin, states that Susan, a grade Guernsey cow, has established a record of 170 pounds of butter in sixty consecutive days, which equals the average yearly production per cow for Wisconsin. The test was concluded February 2nd. In sixty days Susan produced 2864 pounds of milk.

We have been reliably informed that there is a strong likelihood of Australia butter merchants coming to California for butter again this summer. Our informant states, however, that the buyers will be more particular on account of last year's disappointing experience and that only butter of known quality will be considered.

D. V. Konzenberg of the Modesto district has purchased from C. Peterson of Ceres, seven aged cows, six heifers and three bulls, all of which are registered Jerseys. Mr. Konzenberg does not believe in raising hay for the market even at the present prices and says that you can't afford to dairy with anything else than purebred dairy cattle at this time.

That California is to make a name for itself in Holstein circles seems apparent from the announcement that a pedigree and sales company is soon to be formed by the leading breeders of northern and central California. It is the intention of the breeders back of this organization, we are told, to make the Sacramento valley the Syracuse of the west. Sales will be held at which all breeders may consign, the association reserving the right to reject any animals which are not of high quality.

The annual meeting of the Ferndale Cow Testing Ass'n was held at Ferndale last week at which time the following officers were elected for the coming year: President, Aksen Quist; vice-president, Guy Sears of Metropolitan; secretary and treasurer, Bernard Crowley; directors, G. E. Trigg, J. N. Fulmor, J. W. Coppini, L. Lindrum, Charles Joppas and H. Hurlbutt. An effort is to be made to secure enough cows to keep three testers busy, there being several herds on the waiting list at present

O. R. McGee of Stanislaus county cut 250 tons of hay from 36 acres of alfalfa last year. He sold 100 tons and has been feeding 35 Jersey cows and calves all year and will have plenty to last till the first cutting this spring. He credits his large yield to the fact that he has a pumping plant and during the months of August, September and October when there is no water in the ditches he can give it a good soaking. His well and plant cost him about $1200 and have paid for themselves in the two years he has used them.

SWINE.

W. D. Trewhitt of Hanford has just received a large type Poland China sow from Iowa. The weight of the sow is given as 500 pounds.

John Daggs is beginning to pick out the choice ones for his show herd at the State Fair this year. He expects to have entries in all classes.

Wm. Bernstein of Hanford has recently sold an eight-months-old Poland China boar to John Baker, which will be shipped to the Hawaiian Islands. There have been a number of hogs shipped to the Hawaiian Islands in the past few years and there is no reason why this market should not be enlarged.

At a meeting held in Glenn county last week, the Glenn County Berkshire Breeders' Ass'n was organized and officers elected. It is gratifying to see the community effort which is being made in several counties of the State with some particular breed of livestock instead of scattering the interest over a large number of breeds.

The auction of registered Duroc Jerseys held by R. J. Ross at Mo-

The Book of Dairy Books

It's *the* book, because it's *the* authority on *the* breed—the beautiful, ever-paying Jersey.

This book, "About Jersey Cattle," goes way back to the beginning of the breed, shows how it was line bred and protected from mixture by law, and shows why it has developed into the most economic and most persistent milking of all breeds. It gives tests, yields, etc., proving that the Jersey is the *money* cow—the "Giant of The Dairy."

The book is free but worth a lot. Send a postal for your copy *today*.

SWINE.

BIG TYPE POLAND CHINAS—One to a carload. Any age, either sex. 600 on hand. They have plenty of size, extra good hams and shoulders, strong arched backs, great length, depth and thickness of body, with good looks as well. Many are sired by IOWA WONDER, a 1000-pounder in show condition. I believe his pigs are the best in California. Visitors say they are the best they have ever seen. He sires the kind that grow faster and larger, have more, better and stronger pigs, and are more practicable and profitable—the kind that are highly satisfactory. Extra special prices on account of being overstocked. I have hogs galore. Prices will surprise you. Satisfaction guaranteed. Write Geo. A. Smith, Corcoran, Cal.

BILLIKEN HERD OF IMPROVED CHESTER WHITES—Everything registered and Cholera Immune. Have two young boars of service size and a few bred gilts to offer. These are extras in every way. Price very reasonable. Have recently received some bred sows from the East that are from Grand Champions and are bred to Grand Champions, from the best and most popular blood lines. Will have an attractive lot of pigs to offer from the coming spring farrows. These will be the equal of any raised in this country. Am booking orders now for same. Write for prices and catalogue. C. B. Cunningham, Mills, Sacramento County, Cal.

YOUNG POLAND CHINAS—Large type boar, "I. B. A. Wonder" won first in class and Reserve Champion P. P. I. E. 730 lbs. under two years in breeding condition. Sows bred and sired by "I. B. A. Wonder." Also weanling pigs, either sex. Trios unrelated. None bigger. None better. $15 and up. Will please you or money refunded. W. A. Young, Lodi, Cal.

BLUE RIBBON HERD OF DUROC JERSEY HOGS—With 125 head of choice gilts and boars sold in year of 1915, I am going to sell 150 head in 1916. They sell because they are choice, and people are given a Square Deal on good ones. I have no $10 and $15 kind I don't have to auction them off. John P. Daggs for prices, Modesto, Cal.

REGISTERED DUROC-JERSEYS—Prize-winning stock from Iowa, Nebraska and Wisconsin. 75 head—bred sows and gilts. Also weanlings in groups of from one to five and boar unrelated of Crimson Wonder, Golden Model, Alvancer, Golden Hero, Orion, Chief and Colonel blood. Price $10 and up. Haden Smith, Route 1, Box 97A, Woodland, Cal.

HAMPSHIRE SWINE—Both males and females from Grand Champion 700-lb. boar and Grand and Junior Champion sow. Also Guernsey bull calves from Grand Champion bull. BELLA VISTA HERD, J. W. Henderson, 1st National Bank Bldg., Berkeley, Cal.

REGISTERED BERKSHIRES—World's Fair Grand Champion at the head of the herd. Also winners of Senior, Junior and Reserve Grand Champions. Stock of all ages for sale. Grapewild Farms, A. B. Humphrey, Prop., Escalon, San Joaquin Co., Cal.

BERKSHIRES—I have one of the best herds on the Pacific Coast, including Grand Champion Sow, Reserve Grand Champion Boar under one year, Third Aged Boar, etc. Frank A. Brush, Santa Rosa, Cal.

REGISTERED BERKSHIRE WEANLINGS, both sexes, unrelated, $10 each. Also older boars and open gilts, or bred to a fine son of Grand Leader 2nd. J. M. Bomberger, Modesto, Cal.

DISPERSION SALE—Registered Poland Chinas. Grand big sows. Herd boars and pigs of all ages. Write quick for low prices and descriptions. Roy J. Turner, Trowbridge, Cal.

BLATCHFORD'S PIG MEAL weans easily and safely; no trouble; no milk. Write for free folder, "The Safety Route from Pighood to Porkage." Coulson Co., Petaluma.

CROLEY'S BALANCED PIG FEED for growing youngsters; also cheaper hog feeds for big hogs. Geo. H. Croley Co., Inc., 631-637 Brannan St., San Francisco.

REGISTERED PUREBRED BERKSHIRE PIGS—Weanlings—both sexes. Reasonable prices. Write for full information. J. E. Hall, Sebastopol, Cal.

CHESTER WHITES (O. I. C.'s)—Bred gilts, $30. Bred sows, $45. Weaned pigs, $10. Also a fine herd boar 20 months old. D. Bache, Hollister, Cal

LITTLE BLACK ESSEX—Service boars and weanlings. Only herd in the State. Limited supply. Yolo Essex Herd, L. W. Millsap, Yolo, Cal.

DEL DAYO FARM (Old Haggin Bottom Ranch)—Breeders of registered Berkshires. Both sexes for sale. Stephen A. Day, Box 1140, Sacramento.

RANCHO RUBIUS—Durocs all sold except one service boar and a few October pigs. Spring litters will be "best ever." Elmer Lamb, Ceres, Cal.

ROSELAWN STOCK FARM—Registered Poland Chinas and Shorthorn cattle. Young stock, both sexes, for sale. T. B. Gibson Estate, Woodland, Cal.

desto last week was not a financial success; in fact the bidding was so slow that it was thought best to stop the sale after five sows and one boar had been sold. Prices averaged close to $25 for aged brood sows, heavy with pig and buyers considered they got some real bargains. The low prices received were generally credited to the fact that there were only a few outside buyers and to the scarcity and high price of feed at the present time.

BEEF CATTLE.

Chaplin and Maltby of Concord purchased 14 carloads of cattle at the Curtner and Abel ranch in Paradise Valley, Nevada, last week.

C. M. Ellenwood received 20 carloads of Nevada feeders last week for his ranch near Cooperstown, where they will be fed on the foothill ranges.

The sheriff of Tulare county is at work compiling a list of all cattle owners, butchers and buyers, which is to be made a part of a general record for the county. It is thought the list will be of value in tracing lost cattle.

John L. Laney of Tulare county has purchased 53 head of purebred Shorthorns from L. A. and J. K. McComber of Pixley. Many of the cattle in this herd were imported from Kentucky and Ohio and are said to be excellent individuals.

As a result of the good weather which has prevailed the past two weeks grass on the ranges in Santa Barbara county is said to be growing fast and quite a large number of feeders are being shipped into the county as a consequence.

A report from Healdsburg last week stated that there were 2500 head of cattle in Mendocino county sufferng on account of the snow on the ranges. Lawrence Bros. have 250 head on their Alexander Valley ranch which they brought down from the mountains on account of the feed situation.

Preliminary steps for drafting a contract between the State of Nevada and the federal government to handle the fight against rabies were made at a meeting of the State Rabies Commission held at the university last week. All members of the commission were present and the situation was thoroughly discussed and important matters taken up. Official application to the federal government for aid was made and a systematic campaign will be started soon.

Dogs have killed over 75 head of sheep on the Live Oak ranch owned by Frank Meacham in Sonoma county during the past month. Mr. Meacham estimates the cost to be right around $1,000 as they were all purebred animals.

SWINE.

IMPERIAL STOCK FARM BERKSHIRES—Registered stock of all ages. Price and description on application. R. J. Merrill & Son, Morgan Hill.

Operator Installer Lineman Clerk

The Picked Army of the Telephone

The whole telephone-using public is interested in the army of telephone employees—what kind of people are they, how are they selected and trained, how are they housed and equipped, and are they well paid and loyal.

Ten billion messages a year are handled by the organization of the Bell System, and the task is entrusted to an army of 160,000 loyal men and women.

No one of these messages can be put through by an individual employee. In every case there must be the complete telephone machine or system in working order with every manager, engineer, clerk, operator, lineman and installer co-operating with one another and with the public.

The Bell System has attracted the brightest, most capable people for each branch of work. The training is thorough and the worker must be specially fitted for his position.

Workrooms are healthful and attractive, every possible mechanical device being provided to promote efficiency, speed and comfort.

Good wages, an opportunity for advancement and prompt recognition of merit are the rule throughout the Bell System.

An ample reserve fund is set aside for pensions, accident and sick benefits and insurance for employees, both men and women. "Few if any industries," reports the Department of Commerce and Labor, "present so much or such widely distributed, intelligent care for the health and welfare of their women workers as is found among the telephone companies."

These are some of the reasons why Bell telephone service is the best in the world.

FIRST EDITION—1915

860 pages; handsomely illustrated. Cloth bound.

Prof. Woll has had long experience in the work covered by his book. Before coming to California a few years ago to take up his work at the University Farm, Davis, he was for years Professor of Agricultural Chemistry, University of Wisconsin. This book in a practical way covers productive feeding from a scientific standpoint. Every breeder of stock needs this work to make a success of his feeding operations.

Price, $1.50 Postpaid.

Segis Pontiac de Kol Burke

The bull that combines the blood of the greatest producing families in Holstein history. He is an outstanding individual weighing 2200 at just three years of age. His dam RIVERSIDE SADIE DE KOL BURKE, is the heaviest milker that the breed has ever developed. She and six of her sisters have records above 30-lbs. butter in seven days.

A few sons of this sire are now available, some of which are soon ready for service.. Several are from half sisters to Aralia De Kol, 30-lbs. butter in seven days at 12½ years, 28090 lbs. milk and 1142 lbs. butter in one year. Prices reasonable.

Pedigrees and Prices on Application.

Veterinary Queries and Replies.

[Answered by Dr. H. B. Wintringham, Petaluma.]

Correspondents desiring a reply by mail should send money order for $1.00. No charge is made when questions are answered through this department.

A CRIBBING HORSE.

To to Editor: I have a young horse that I cannot stop from cribbing or wind sucking. He has it bad. Please tell me if there is a cure.—D. M., Boulder Creek.

[This is a habit that is practically incurable. Try muzzling the animal between feeds.]

HORSE WITH WORMS.

To the Editor: Can you tell me what to do for a horse that has worms?—E. B., Byron.

[Give five grains arsenic, two drams tartar emetic and two drams iron sulphate in the feed once a day for one week and follow with a quart of raw linseed oil.]

SOW HAS WORMS.

To the Editor: One of my sows has gotten so poor that there seems to be no flesh on her. She has a good appetite and gets plenty to eat. She seems to be weak in her hind quarters. Can you tell me what to do for her?—J. A. A., Clovis.

[Your sow has worms. Give her the following: one dram powdered areca nut on an empty stomach, followed six hours later by four ounces of castor oil. Repeat treatment in six days.]

COW WASN'T DRIED UP AT RIGHT TIME.

To the Editor: I have a cow that came fresh February 11, that hardly gives enough milk for her calf. With her first calf she gave an abundance of rich milk and it was almost impossible to dry her up. I feed her well with alfalfa hay and bran. Any advice would be appreciated.—A. N., Lodi.

[Your trouble comes from not drying this cow up before calving. Try the following: Fluid extract nux vomica, one ounce, fluid extract gentain, one ounce, fluid extract cascara sagrada, one ounce, enough Fowler's Solution to make 12 ounces. Give one tablespoonful in feed three time a day.]

HEIFER DON'T COME IN HEAT.

To the Editor: Have a heifer that dropped a calf in August but does not come in heat, although I have had her ovaries manipulated. Is there a medical treatment? One of my horses coughs rather too much and always at night, or if standing idle, but never when at work. Has good mixed hay, very dry. Sometimes runs at nose quite freely. He has been in this condition about six months. Please advise treatment.—E. W. D., Merced.

[Try the following for your heifer; one dram powdered iron sulphate, twice a day for two weeks. Give your horse 5 grains potassium bichromate in one ounce of water, three times a day.]

BRINGING BACK MILK FLOW.

To the Editor: I have a cow that was supposed to freshen about January 1. As she showed every indication of carrying a calf she was dried up about three weeks previous, but she has refused to make any bag, and it is quite evident that she was not pregnant, although careful watch has been kept for signs of becoming in heat since she went to the bull last March. Today she showed some inclination to be in heat. I have been told that by careful feeding her milk flow can be partially brought back as she was never completely dried up. Please advise whether this can be done and how before she freshens again.—C. A. B., Sacramento.

[Heavy feeding and thorough milking will partially bring back the flow, but it will not be as strong a flow as it was before you dried her up.]

COW HAS RHEUMATISM.

To the Editor: I have a cow that comes in heat at irregular intervals from ten to fifteen days. She gave birth to a healthy calf about six months ago, and is now in good condition and milking well. What can I do for her? I have another cow that is quite lame in one hind leg. When she walks it seems to fly out of place. As she walks it pops and seems to be quite painful to her. The trouble came on very gradually. What would you advise?—G. B., Tulare.

[Have the first cow's ovaries examined by a veterinarian. The other cow has rheumatism. Give one dram each in water of sodium salicylate and formalin twice a day.]

HORSE WITH BARBED WIRE CUT.

To the Editor: About three months ago one of my horses cut her foot on barbed wire, between the fetlock and the hoof. It healed up in six or seven weeks, except small hole, from which pus continued to run. Finally that closed up but it keeps breaking out in a new place near the crown of the hoof. She is too lame to work. What can be done for her?—J. L. G., Ripon.

[Inject tincture of iodine in the opening once a day. If this fails to heal up the opening properly, an operation will be necessary.]

PIGS HAVE ACUTE INDIGESTION.

To the Editor: I have a few sick pigs that at first carried their head on one side and a few weeks later began to stagger and walk in circles. When eating out of a trough they would fall over backwards, having difficulty in getting on their feet again. One of these pigs became paralyzed in hind quarters so I killed it. His stomach contained no food, only a yellowish green slime and the lining was covered with sores. His intestines were full of food. When drinking sour milk and swill pigs seemed to be very hungry, but could only drink slowly. Please advise disease and cure.—C. V. P., Wash Station, Sacramento county.

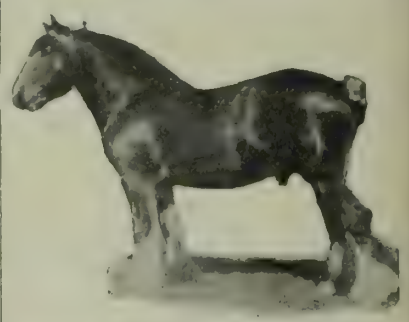
[This is acute indigestion, probably brought on by overfeeding. Prevention is the best remedy. Cut down their ration.]

COW GETS SICK AFTER FRESHENING.

To the Editor: I have a cow that was giving about three gallons of milk, up to the middle of January, when she took sick and refused to eat. I gave her one pint of Boiled Linseed Oil. This acted about three hours afterwards. She was then lying down and unable to get up. On striving to get up she passed blood with urine very thick. I gave her a dose of nitre, which seemed to do her good and in about three days she was able to eat her usual ration. Her milk flow dropped off about two quarts, but has since dropped to about a gallon. I fed her beet pulp, soaked, citron, and as much alfalfa hay as she would eat without wasting. This morning she refused her feed except citron. I gave her a bran mash and one-half pint of Linseed Oil and she now seems shivery and her urine is thick again. Any information will be thankfully received. —F. H. S., Fresno.

[Raw Linseed Oil is the proper oil to use for a purge. Boiled Linseed Oil kills animals in large doses and it is a wonder that your cow survived the treatment you gave her. Give two pounds Epsom Salts and discontinue the citron in the feed.]

SALVADOR STOCK FARM



Shire Stallions

If you are in the market for a Shire Stallion, and wish to take advantage of the fact that I am closing out, you had better do so at once, for they are selling fast. All the young stock is sold, but I still have a few **first-class Stallions** for sale. These stallions are some of the best I ever imported, and include first-prize winners and champions.

Be Careful What You Sing When Milking.

To the Editor: I would like to know which brings the best results, fast or slow milking. For example, suppose I had two fresh cows, testing the same and giving the same number of pounds of milk daily and the same treatment is accorded both. A. milks one of them, being a very slow milker, using but one hand part of the time, and B., who is a fast milker, milks the other one. Which would secure the best results?—Subscriber, Glenn county.

[Answered by Prof. Gordon H. True, University Farm, Davis.]

[My notion on this matter as a result of experience in milking is that in so far as the motion of the milker is concerned it is necessary to milk some cows with a quicker movement than others, that the small teated cows would naturally be milked much faster than the cows with a large teat capacity, so to speak. I know that I have had to milk certain Jersey and Shorthorn cows in the same string and it was impossible for me to milk the latter as fast as I could milk the former. It used to be a saying of old Governor Hoard's in Wisconsin that it was all right for a man to sing while he milked keeping time to his music, as he naturally would, with the milking operation, but that in the milking of some cows you would have to sing Old Hundred and with others Yankee Doodle, but it would be important that a man should not make a mistake and sing Old Hundred to the Yankee Doodle cow and vice versa. This seems to me to express the idea that I have in mind pretty well.

Other things being equal, I think the milker who has sufficient strength to milk continuously without resting will get better results than the one who has to delay on account of weakness or lack of grip, and that the more nearly one is capable of taking the milk flow as fast as it comes, the better milker he is.]

No Citrons for Sows in Pig.

To the Editor: In your issue of February 5, I notice an inquiry from a Visalia subscriber in regard to piemelons for sows. I have had some experience with citrons or piemelons, fed to sows that were due to farrow in three or four weeks. I was then feeding about four or five citrons a day per head and every sow in that feed lot lost her pigs from one to two weeks before they were due. Some came dead and others alive. We were then feeding a liberal allowance of grain with the citrons.

I have fed citrons at other times when the sows were not so far along in pig with no unfavorable results. I have also heard of others who have suffered loss in the same way, so advise E. W. V. not to feed piemelons in large quantities to sows due to farrow in three or four weeks and to be on the safe side make it five weeks.

After the pigs arrive there is no danger that I know of, if fed with grain. I hope other readers will tell of their experiences with piemelons. —F. W. Barney, Hanford.

[In view of the large amount of citrons or piemelons that are grown in the various parts of the State there should be a great deal of information available regarding their value, etc., and we should be pleased to relate others' experience regarding their feeding value.—Editors.]

YOUNG SOW WON'T BREED.

To the Editor: I have a young registered Berkshire sow that won't take the boar. She comes in heat, but won't breed. She is about 16 months old. What can I do with her?—D. W. G., Colusa.

[Answered by Chas. Goodman, Williams.]

[This is not an uncommon occurrence with Berkshire sows and with other purebred hogs we suppose. It seldom happens among scrubs.

Mr. A. J. Lovejoy, a veteran Berkshire breeder, advised us to use a breeding crate. The process is what the darkey would call "being forced." As we have no breeding crate at hand we never tried it.

Dr. A. C. Rosenberger of the U. S. Dept. of Agr. examined a sow which we had been unable to breed and said that she had some disorder of the ovaries and would never breed. His statement proved true.

Last summer we had a gilt that was about in the condition of the one described above. We let Nature take its course and after a time everything came around all right and she is now due to farrow March 2.

If the sow is a very valuable one we would consult Dr. Neilson of Colusa or some other good veterinary surgeon. The difference in price between breeding and market hogs is so small that it would hardly be advisable to spend much money in treating an ordinary hog.

Dairymen around Elk Grove are agitating the organization of a cow-testing association.

It costs less to buy a

DE LAVAL

than to buy experience

EACH year some 40,000 farmers, who have bought at one time or another "cheap" cream separators, discard their inferior, cream wasting machines and replace them with clean skimming De Lavals.

These men bought the "cheap" machines because they thought they were "good enough" or "just as good," and that by purchasing such machines they could save a little money. They actually would have been better off in most cases had they bought no separator; for they lost most of the money they spent for the "cheap" machines, besides all the cream these machines have failed to get out of the milk.

No one ever saved money using a "cheap" cream wasting separator or an old or half-worn-out machine. No one ever got back the money spent for such a machine by continuing to use it. Those who bought "cheap" machines and got out of the difficulty best are the ones who quickly discovered their mistake, discarded the inferior machines and put in real cream separtors—De Lavals.

There are nearly 2,000,000 farmers who have bought De Lavals, and every one of these had just as many opportunities to buy "cheap" separators as any one else. They did not do it and are now money ahead. They have avoided paying the high cost of experience, and their De Lavals have paid for themselves many times over. It always pays to buy a separator of proved, known superiority.

The nearest De Laval agent will be glad to let you see and try a De Laval on your own farm, without obligating you in any way. It is better to take advantage of this opportunity than to pay dearly for your own cream separator experience. If you don't know the local De Laval agent, simply address the nearest main office as given below.

NATURAL INCUBATION.

[By Mrs. Susan Swaysgood, Pomona.]

There are a great many ways to set a hen and it sometimes happens that the hen will have none of them, but just suits herself. This is only excusable when the hen is on range and steals her nest, as sometimes happens, and she generally makes a fair job of it because she does it in her most natural way.

This is, of course, one way of natural incubation, but we really can't afford to use it because the hen may sit on one egg or a dozen and if left to spend three weeks of her time on one or two eggs we are the loser.

When a hen steals her nest she usually finds a nice, quiet place, away from other hens and secluded from observation from any and all things. And we can pretty well imitate her in this one thing, and that is about as far as it is wise to venture into the strictly natural method of incubation.

Making the Nest.—Find a quiet place, away from other fowls, and be sure dogs or cats can not bother her, then make your nest. If a hen has been used to laying in a box, give her a box somewhat similar in appearance for a nest and if she is accustomed to laying on the ground make her nest on the ground. It pays to humor a hen in these little things.

In the bottom of the nest, whether it is a box or an earthen nest, lay a good half of a gunny sack, well sprinkled with coal oil. This will protect the hens from mites, if there should be any in the buildings, then put soft straw or hay on top of the oily sack, filling up all corners to prevent eggs from rolling into them. In fact the nest should resemble a saucer in shape; the size being regulated by the size of the hen that is to occupy it for three weeks.

Don't lose sight of the latter item, for three weeks is a long time for a hen to set on a dirty, poorly made nest and sometimes, no matter how good a hen she is, it is not possible for her to stand three weeks of punishment, just to have a family. It nearly always turns out that the person who made the nest and set the hen is to blame for broken eggs and deserted nests.

After the nest is ready, put in a few decoy eggs for a start and after dark move your hen from her old nest to the new one. Dust her thoroughly before doing so, however, then put her where she can see the nest, and if she is a good hen and the nest is inviting she will take to it herself without compulsion.

Feed Well.—If she takes to her nest, shut her up so that nothing can disturb her and the next morning place food and water where she can see it. If she sets very quietly through the first and second days it will be safe to give her the eggs you want hatched. Always keep food and water where setting hens can see it for they usually get off the nest very early in the morning, and if food is not handy, either go back to the nest hungry or get away if possible to look for food, then fail to get back to their nest.

The hens should be well dusted at least three times before hatching, then there will be no fear that lice will attack the chicks.

At hatching time, if a hen gets very nervous, it is best to leave her to herself, allowing room for the chicks to get from under her and yet not get away to be chilled. A little close watching at this time is often better for chicks than too much meddling.

After the hatch is off, feed the hen generously; she has earned it and really needs it. It is a mistake to think hens do not need good feed at this time on the theory that they give no nourishment to the chicks. If you hold this belief just watch the chicks of a half-starved hen and those of a well-fed hen and see which lot grow the fastest, look the slickest and run the quickest. You will soon find that the well fed hen does really impart her vitality to the chicks.

MARKETING RANCH EGGS.

To the Editor: I have recently increased my flock of hens so they produce more eggs than I can sell hereabout and tried shipping to San Francisco. The grocer wrote he had to sell them as seconds because they had not been handled right, but he would pay top prices if we were more careful. Can you send me some instructions for handling eggs right?—Subscriber, Honcut.

[Answered by Geo. H. Croley.]

[This shipper has been careless in handling his eggs, but just how he is at fault we cannot guess. As this is the season when many farmers will try shipping eggs for the first time, the following which appeared in California Poultry Practice under the chapter entitled "The Care and Management of Eggs" should be helpful to such beginners:

"Market eggs should be gathered and cared for as faithfully as if for hatching. Cases with good clean fillers should be ready to receive the eggs as soon as gathered, and the cases should be stored in a room where the temperature can be kept at about 50 or 60 degrees. There should be no strong smell from vegetables, oils, or other matters, because eggs, like cream, absorb odors—through the shell. The egg fillers particularly should be above reproach, for if there is any broken egg on them, although to all appearances dry and inoffensive, there is danger. All such should be thrown out and clean fillers substituted. No matter how fresh the egg is that comes in contact with a dirty filler, it will soon be tainted. If the eggs are to be shipped to a distant market, no matter if but a few miles, they should be sorted to conform with the demands of the market. If there are both brown eggs and white, the brown eggs should be put in one side of the case and the white eggs in the other, a note on top of each side explaining how many of each. Grocers like this method because it saves them the extra trouble of sorting. If they have agreed to give you one price, it makes no difference. Make a statement of how many dozens of each—they will appreciate it. Also be sure that you send nothing but clean eggs to market. If you have pullet eggs, keep them separate and ship as pullet eggs; if you don't you may possibly lose a good buyer. These are busy men and have no time to spend explaining. Never, by any chance, leave eggs out in the sunshine. Incubation starts very easily in the sun and from then on decay is very rapid. If obliged to carry eggs during the hours of sunshine, a good layer of green grass laid over the case will keep the direct rays of the sun from striking them."]

POULTRY NEWS NOTES.

[By Geo. H. Croley.]

A recent arrival from Nebraska, Mr. E. F. Bailey, has purchased an improved five-acre poultry ranch at Petaluma.

At the meeting of the Petaluma Chamber of Commerce held Feb. 9 the executive committee discussed the matter of establishing an experimental station near Petaluma.

A site is being sought in Oakland on which to build a factory for canning chicken meat. It is claimed that both boiled and roast chicken can be placed on the market by the methods it is intended to adopt.

Judge W. S. Russell has returned to his former home in Iowa for the purpose of disposing of his property and settling up his affairs. In a short time he will return to California and actively take part in conducting the poultry colony adjoining the Oakland and Antioch Railway at Concord.

We have received a copy of California Poultry News, volume one, number one, published at Sacramento by C. A. Wilkins. The initial number is nicely printed on good paper. It is intended to champion the welfare of the fanciers of northern California by whom it will no doubt be appreciated and liberally supported.

Simple and Safe Remedies.

[Wrtten for Pacific Rural Press by Geo. H. Croley.]

During the past two years the poultry keepers in several districts of California have suffered serious loss caused by intestinal worms in their fowls. The ordinary remedies, that in the past had been considered efficient, failed to eradicate the worms or materially reduce the number. Many newly suggested remedies also produced unsatisfactory results, but a safe and simple remedy has at last been discovered. It has been tried by several breeders, all of whom report favorably.

We believe the credit for this discovery is due to A. L. Roddick of Soledad. His original report follows:

"I have found gasoline to be the best remedy for worms in poultry—the only medicine that brought them quickly and dead. I had tried powdered pomegranate root bark, copperas, cresoline in water, onions, garlic, pumpkin seeds, and a proprietary remedy; most of them brought a few live worms but not many.

The dose is one teaspoonful of gasoline to each grown fowl. If given direct, dilute it with milk or sweet oil. I gave it in a moist mash, feeding less mash than usual, and I added some fresh chopped meat so they would eat it up quickly because the gasoline evaporates in a short time. I have also put the gasoline on their wheat.

"This remedy did not reduce the egg production and we lost no fowls through the treatment. All effects seemed to be good ones.

"We found our flock infected with three varieties of worms: the tape, long round, and pin worms, but it seemed to get them all.

"I had 600 pullets about six months old that while they were not sick, they were very poorly developed and were small in comb. They were laying only 3 or 4 eggs a day. A month later, after several doses of gasoline, one would not think them the same pullets. I found that a hen may have a good many worms and still be fat, but she will not lay well. I am moving my hens to new, clean ground and by cropping the old runs for a year or two I hope to eradicate the worm eggs from the soil."

This being such a simple and inexpensive remedy, we recommend that all poultry keepers give their fowls at least one treatment. Some intestinal worms are present in nearly all flocks, but when the conditions are not favorable for them they do not increase rapidly and no very great loss results. It is well to constantly use preventive measures and thus escape a serious loss which is certain to result if they multiply. As the drinking water is the chief medium for spreading the trouble, the vessels should be arranged to prevent the fowls from putting their feet on the edge of the drinking vessels. In the chapter devoted to poultry diseases and their remedies that appears in California Poultry Practice, the following preventive of worms is recommended: "Feed a little wood ashes in the mash feed and give a dose of Epsom salts twice a month."

In building an incubator cellar be sure to have windows on all four sides.

SELLING BABY CHICKS.

To the Editor: I find it very unsatisfactory and profitless to hatch and try to sell baby chicks of good quality while other parties a few miles distant are seemingly reaping a harvest of money by supplying, at half my price, chicks from flocks that are not carefully mated; just a common run of Standard bred fowls that look good, but have never been trapnested or tested by any other system. My fowls may not be superior to those of my competitor in blood or strain, but they are the selected few that rate high for breeding as proven by the trapnest as well as the Hogan method. Anyone who has bred up a high producing strain knows how expensive it is. It costs fully double to produce chicks from such stock and unless a reasonable number can be sold without great additional cost for advertising, it is a losing business. I dislike to sell chicks that I know cannot bring success to the purchaser, but it seems that I must either do that or give up my chick selling enterprise. Can you suggest some remedy for this condition?—Discouraged Hatcher.

[This discouraged breeder is passing through an experience that is common to all conscientious producers. His time and energy have been consumed in creating something superior and he has not yet discovered how to secure the reward that the public is ready and willing to bestow on him. Do the people who buy the half-priced chicks know that our correspondent can sell them something for only double the price that may be worth as much as ten times the value of the "cheap chicks"?

As his communication indicates that business is unprofitable and money scarce, we suggest that he place a neat sign at his gate that reads as follows:

FOR SALE
Baby Chicks
At double ordinary price
We use the Hogan system.
Step in and let us explain.

This will tend to save much time because those who seek low prces will pass on while the prospective buyer who is aiming at ultimate success rather than a penny-wise first saving will be interested. If this plan brings satisfaction and profitable results we suggest that a more extended trade might be established through a similarly flavored advertisement in the Pacific Rural Press.]

POULTRY NEWS NOTES.

Owing to the rapidly growing business of the Tulare Co-operative Poultry Association, it is necessary to seek new quarters. The business for January was greater than any previous January; the business totaling $3861.22.

At a recent meeting of the Petaluma city council a resolution was passed pledging support and co-operation with the city officials in an effort to stop the stealing of poultry in that section of the State.

The Federal and local authorities in San Francisco have notified all egg dealers and handlers that anyone caught selling eggs to be used for food purposes in any form that have been tested out of incubators will be prosecuted. A recent decision relating to the pure food law prohibits the use of such eggs for human food.

A general business meeting of the Stanislaus County Poultry Association was held in the Board of Trade rooms on Feb. 11. A strong effort is to be made to secure the next annual show of the State Poultry Association.

Poultry Breeders Directory

Rates in this directory, 3c per word each issue; or if carried weekly for one year, 2½c per word.

GET YOUR DAY-OLD CHIX FROM ACTUAL PRODUCERS, who know what they have and who can stand back of their chicks. We are utility poultry raisers and our White Leghorn chicks this year are from pen of 635 that averaged 171.2 eggs each last year. Our Rhode Island Reds are also heavy winter producers. Owing to superior transportation facilities in Sacramento, quick delivery is assured. White Leghorn chicks, $12.50 per 100; Rhode Island Reds, $15 per 100. Book at once. Brooke Farm, 807 J St., Sacramento.

LIVABLE BABY CHICKS—We are supplied by reliable Breeders and experienced hatchers. Better chicks cannot be had from any source. All varieties, any number. High quality birds, bargain prices, breeders, laying hens, pullets. Free exhibit. Everything in Poultry, Pigeons, Rabbits, Dogs, Cats, Canaries, Pets. Give us a call or write. Fanciers' Exchange, 642 S. Main St., Los Angeles, Cal.

MAMMOTH BRONZE TURKEYS—Breeding stock. L. Riedel, Patterson, Cal.

The Home Circle Page of the Pacific Rural Press

MRS. BEST'S BULLETIN.

My dear Friends: Years ago women had only two costumes, kitchen and go-to-meeting. Today there is a different costume for every conceivable activity of women, and that has come to cover a mighty wide range of activity. Not only are there costumes for every occupation, as well as every season, but there are costumes for every hour, every room in the house, every mood almost. Now comes the sport suit, so-called, which, for a change, can take the place of a number of other suits and is the little sister of an extensive wardrobe. It is a very good every-day proposition, the sport suit, and it serves well in place of anything you happen not to feel like wearing at the time.

And you can take all sorts of exercise in it, from putting up dumb bells to putting up preserves; from running up a hill or to running up a bill at the store.

Some flannel sport suits are appearing, in grays and check effects. I think they will be liked.

Sport hats of fine braided straw, light and flexible, are to be found at $2.50. These are in half-natural color and solid shades, either the brim or under brim being colored. If the crown is colored the hatband is white; if the under brim is colored the hatband is to match.

Sport belts of white kid with ribbon stripes or bars of solid colors have arrived at 50 cents.

Saw a nifty blue taffeta silk dress of latest cut that was set off with a swagger blue velvet jacket or short coat tried on over it.

"Banjo stripe" tailor material is shown for suits. It is in dull blues or black grays, finished worsteds, with black, gray or sometimes green stripes. Similar stripe material happens also to be the spring fashion for men's suits.

Became convinced of a stunning effect in footgear by seeing it in use. It was a combination of patent leather boots with high wash leather or chamois spats. The wearer looked nifty.

The very high toque trimming (speaking of headgear now) hasn't arrived on the coast yet, or is hard to find. It is probably a bit too early. It'll be here.

The latest bid for novelty is a skating corset. In this the hips are cut away more, but as in any figure corset come down pretty low.

However, I believe skating will be about over soon. So I will stop right here and perhaps find something of more interest than that to chat about next time. Devotedly,

Rosabella Best.

(Note—Readers wishing information from Mrs Best, care of the Rural Press, will receive a reply if they enclose a stamped addressed envelope.)

SPIDERWEB EMBROIDERY.

There is something bewitching about spiderweb embroidery. The use of the web is particularly clever as a background for embroidered floral designs in bright colors; or dragonflies, or butterflies, or appropriately a spider. Any color is suitable for the web. One suggestion is for a Delft blue in varying shades, the lightest being used for the web.

PARKER HOUSE ROLLS.

(This Week's Preferred Recipe.)

Rub two tablesp. butter into one quart of flour and two tablesp. sugar; dissolve half a cake of compressed yeast in one pint of warm milk and when bubbles begin rising mix with the foregoing and set it aside to rise over night. Then in the morning stir in enough flour to let it knead without sticking and put it back in the dish to rise again. When it is light make it into rolls and let them rise again in a moderately warm place until evening when they should be light enough to bake in a quick oven. Brushing them with milk just before baking gives them a fine color. To shape parker house rolls, make a little ball of dough, then squeeze down across the middle of it with a piece of broom handle, and fold over.

THE ACACIA.

By Sunbonnet Sue.

The rich olive green of the acacia is a benediction to my eyes.

I call it the blessed tree, the acacia. It is full of the spiritual, and its life a round of good favor. It has the poise of perfection.

It has the vitality of honor in a place where it may live. It flourishes and is grateful to its environment. But in a landscape or a clime that is harsh it has no being.

With a subtle dignity it seeks a clime that is gentle and a scene that is a scene of beauty. It crowns the landscape with its perfection.

It is true, the acacia, and does not mope in the winter. On the contrary it bursts forth into vigor that is inspiring. It scents the days of dullness with its blossoms.

Amid the rains it laughs and tosses its arms laden with an incense of golden flowering.

It is my cheer in the days that are gray and a cool consolation in the brightest of sunlight.

It is clean and immune. The pests of the woodland respect it. The acacia is wholesome.

I am at peace with an acacia by my door.

BABY WEEK.

Another observance week has been "wished" on the land, and this time it is March 1-7 inclusive, and is spoken of as Baby Week. It is much different from Mothers' Day, since it has much more than a sentimental purpose, being in fact almost wholly practical. Another interesting feature of it is that the United States government is back of it—at any rate semi-officially; and it is by the Department of Labor that the observance is sponsored.

The plan is that during this week special attention should be given everywhere to the study and discussion of plans for the betterment of baby-life in town and country; in fact it is for the doing and planning of everything that will make better, brighter and more brawny babies.

EXPERIENCE EXCHANGE.

Miss Myrtle J., Selma: In your bedroom you might use chintz draperies and simple cottage furniture in a neutral shade of greenish gray, but the bed should match the other furniture. Glass covers for the tops of the tables and dresser are correct, and lace covers or chintz to match the draperies are placed under the glass.

Mrs. A. L. C., Santa Ana: A good dough for strawberry shortcake is made with 1 cup flour, two tablesp. butter, 1-3 cup milk, 2 teasp. baking powder, a little salt, and 1 teasp. sugar. This should be rolled out 1 inch thick and baked in an oven not too hot.

That old poem, very popular among sentimental ladies of the '70's, "The Gipsy's Warning," for which a reader asked a short time ago, is printed today on the opposite page. We do not know the name of the author.

SKIM MILK CHAMPIONED.

The general impression seems to be that skim milk is of faint value as food. The idea is that it has been skimmed of that which renders it of use. It is spoken of in terms of contempt. There is a prejudice against it that is laughably inconsistent with its employment for feeding livestock. The man who gives it to his hog with traditionally good results very often is the first to hoot at the suggestion that it is of any use as a human diet. As if a hog or calf could thrive on something that was not real food.

The Department of Agriculture is patiently trying to convince the thoughtless public that skim milk is real food. In skim milk is left all the sugar, and all the protein. It is as nourishing in a way as beef, and at the usual prices about twice as economical.

THE OLD MAN ON THE CRACKER BOX SAYS:

By Fred Schaefer.

A look of innocence is what a man wears when he comes home with cloves on his breath.

Some men's acquaintanceship isn't cultivated long before you strike plow sole.

The swiftest way to have the subject changed to crops or the weather is to mention any of your misfortunes.

In a general way we think of cooks as despotic, but as a matter of fact they are Too Easy.

What has become of the old-time clerks who were drilled in the truth instead of salesmanship?

Nobody is neutral about the rain; one is either for or "agin" it.

A pretty woman and a homely man are equally proud of the fact.

The more you rob the soil, the more it robs you.

In the meantime this thing of preparedness is an old story to the man with a lemon grove and plenty of fire pots.

Agents have no trouble selling anything to the lady of the house if they start telling about something that happened at home.

THE PNEUMONIA SCARE.

That title is a bit misleading—there isn't exactly a scare, but there is a most broad discussion of this treacherous disease, combined with an agitation for better prevention. As anyone must know who has done a good deal of general reading of newspapers and periodicals, there have been an unusual number of articles this winter devoted to the peculiarities of pneumonia and the best ways of combating it. Since the rigors of colder parts of the country are not the exclusive promoters of the disease, advice concerning it is just as good here.

The main reason for the awakening to pneumonia is that it is statistically responsible for more deaths than any other natural cause in the United States.

The article in a recent Home Circle page of the Pacific Rural Press, which was headed "Recuperation," dealt most pertinently with the best way of avoiding this scourge, although pneumonia was not specifically mentioned. Pneumonia is a disease that attacks a system which has suffered exposure and which has not had a chance normally to recover from it.

By the way, a "cold" is the advance agent of pneumonia. In every case where pneumonia develops, chill and fever is the first symptom; although everyone who has a cold does not have pneumonia. The thing to do is to take care at once of the cold. And the best thing is to avoid having a cold by breathing plenty of fresh air, taking exercise, and keeping the body and feet comfortable.

Generally speaking pneumonia is a "cold" that affects the delicate lining of the lung, much as the throat passage is affected by throat colds, the result being that the swollen, infected lung surface cannot perform its functions, and the patient practically smothers. This explains the rapid, labored breathing during the illness, the least affected part of the lungs having to do double duty.

It should also be remembered that pneumonia is contagious. Where there is a pneumonia patient the same precautions should be taken as with a tuberculosis patient. Pneumonia is transferred by germs exhaled or discharged by the sufferer, and anyone near by who is not in the best of physical condition will take the disease very easily.

THIS WEEK'S BEST HOUSEHOLD HELP.

To get a high finish on starched linen—Starch the linen twice before ironing; that is, starch, let it dry, then starch again. Then iron once and let dry, then dampen slightly with a wet sponge and iron again.

BILLIARD GREEN LIKED.

With vivid colors in favor, billiard green is among those put forward most persistently. Sport costumes of solid billiard green are already on the market. It is also being used in costumes for little girls, and is usually fur-trimmed.

THE GIPSY'S WARNING.

Trust him not, O gentle lady,
Though his voice be low and sweet;
Heed him not who kneels before thee,
Softly pleading at thy feet;
Now thy life is in its morning,
Cloud not this, thy happy lot,
Listen to the gipsy's warning—
Gentle lady, trust him not!

Lady, once there lived a maiden,
Young and pure, and like thee, fair;
Yet he wooed, he wooed and won her,
Thrilled her gentle heart with care.
Then—he heeded not her weeping—
He cared not her life to save!
Soon she perished— now she's sleeping
In the cold and silent grave!

Lady, turn not from me coldly,
For I have only told the truth—
From a stern and withering sorrow,
Lady, I would shield thy youth;
I would shield thee from all danger,
Shield thee from the tempter's snare—
Lady, shun the dark-eyed stranger—
I have warned thee. now beware!

Take your gold—I do not want it;
Lady, I have prayed for this—
For the hour that I might foil him,
And rob him of expected bliss;
Aye, I see you're filled with wonder,
At my looks so fierce and wild—
Lady, in the churchyard yonder
Sleeps the gipsy's only child!

BUILDER, SPARE THAT ATTIC!

Not everybody can have ancestors, portraits, family skeletons and the other things that go with lineage, but everybody can have an attic if they will make a stand for it and not allow a mere style in houses to deprive them of their rights. An attic is the nearest substitute for a family tree that has been discovered. It takes only a few generations to furnish it with mementoes that constitute a complete genealogical history of the occupants of the house. And these are the things—like portraits and skeletons—that go to preserve family pride.

No man can go into the attic and see the first copper-toed boots he wore as a boy hanging to the rafters without feeling some sort of a stir within him. He cannot see the remains of his grandmother's hoopskirts without feeling somehow that there's a connecting link between him and the history of his country. As for the padded silk brocaded vest his grandfather wore on his wedding day it is a patent of respectability equal to a suit of armor—besides looking a good deal like one.

Happy the family that has such an attic! Happy the family that has lived in a house long enough to see it properly furnished! There will be Johnny's initials carved by himself the day he was exiled for remarks at table. (It was Sunday and the minister had come to dinner.) There will be the dress Susie wore to her first party. There will be relics of all the styles of furniture that have come and gone since the family moved in with their horsehair stuffed chairs. There will be a complete history of the chromo age of art tacked on the walls. Captain Cuttle with his hook and glazed hat. Ichabod Crane, Tam O'Shanter beating the witches across the bridge. Napoleon at St. Helena. Execution of Charles I. There will be books, too, banished from the showy shelves downstairs for the offense of being ragged and in no condition to be seen by company. "Treasure Island." "Charles O'Malley." "Oliver Twist." "Midshipman Easy." "Foul Play." Westward Ho." 'The Cloister and the Hearth." "Handy Andy." "Mysterious Island." There will be the wreckage of all the Christmases since Johnny got his first skates. The chafing dish that didn't work. The cuckoo clock that blew up. The plaster Diana who fell off the piano and lost a leg. Father's mustache coffee cup.

And in pitiful ignorance of the far-reaching and fundamental significance of it all, builders are now boldly advertising as a point of merit houses with "finished" attics!—Kansas City Star.

THE FAIRIES OF ST. DAVID.

A long time ago, Elidorus, a boy 12 years of age, was punished by his schoolmaster, and he ran away and hid in a cave by the river, and there he remained without food for two days. Two wee men then appeared and said:

"Follow us and we will take you to the land of Delight."

And Elidorus followed them through a dark passage down the earth, out into a rich beautiful country. But there was no sun or moon or star there, only a strange twilight falling from a strange sky. The two wee men led Elidorus to their king, and the king made Elidorus the companion to his eldest son. And the people of the Twilight Land were very small, but they were very handsome, and they had long golden hair that fell over their shoulders. The King of Twilight Land allowed Elidorus to go back through the dark passage and visit his mother, and one day Elidorus was telling her what a rich country he lived in, and she bade him bring her some of its treasures.

So the next time Elidorus played with the son of the king he stole a golden ball and ran with it to his mother's house. The two wee men, however, pursued him, and they tripped him up just as he got indoors, seized the golden ball from his hand, and departed.

Elidorus was very sorry he had stolen the golden ball, and he wanted to beg the king's pardon, but the passage in the cave by the river side was closed and was never opened again to Elidorus.

Dad's Eccentricity.—Father will carry an armful of packages two miles for the good-looking wife of a neighbor, but mother says if she wants him to bring in one scuttle full of coal he raises all sorts of a racket.—Macon Telegraph.

His Turn Now.—"Are you going to have another garden this year, Mr. Smith?" "No, I ain't!" snapped Mr. Smith. "It ain't my turn. My neighbors are going to have the garden, and I am going to keep chickens."

Double-barrelled Invitation.—Little Bobby wanted a birthday party, to which his mother consented, provided he ask his little friend, Peter. The boys had had trouble, but, rather than not have a party, Bobby promised his mother to invite Peter. On the evening of the party when all the small guests had arrived except Peter, the mother became suspicious and sought her son.

"Bobby," she said, "did you invite Peter to your party to-night?"

"Of course I did, Mother."

"And did he say he would come?"

"No," explained Bobby, "I invited him to come all right, but I dared him, too."

The grand prize award bestowed upon Ghirardelli's Ground Chocolate by the Panama-Pacific International Exposition is in exact accord with the judgment of the entire Pacific Coast where Ghirardelli's has long ruled in supreme favor.

A daily cup of Ghirardelli's Chocolate is health giving, health sustaining and always appealing to the appetite. The hermetically sealed can in which it comes is health protecting. Order from your grocer today.

Pacific Rural Press Market Report

PRICES QUOTED AS PAID TO PRODUCERS.

San Francisco, Feb. 23, 1916.

WHEAT.

Lack of ships to handle export business is causing an easy feeling in the East, and the local market is quiet and easy in sympathy, though there is little actual change in quotations. California club is quoted a little lower, but the northern grain is about as before.

Cal. Club, ctl.	$1.75 @1.80
Northern Bluestem	1.97½ @2.02½
Northern Club	1.85 @1.87½
Northern Red	1.85 @2.05

BARLEY.

While a good deal of barley has gone East by rail, shipping facilities are poor and the stock is moving off slowly. There is also a disposition to sell on the speculative market, which has reacted on the spot situation, and values are easier.

Shipping, ctl.	$1.40 @1.42½
Choice Feed, ctl.	132½ @1.35

OATS.

The local demand for feeding is not very heavy, and with plenty of stock for all requirements values hold steady.

Red Feed	$1.35 @1.37½
Red Seed	1.45 @1.65
White	1.50 @1.55

CORN.

Eastern yellow holds steady, with the usual moderate demand here, and little local stock is appearing. The sorghum grains are in fair demand at the old prices.

Eastern yellow, ctl.	$1.80 @1.85
Milo Maize	1.40 @1.45
Kaffir	1.65 @1.70
Egyptian	1.50 @1.55

BEANS.

The downward movement in beans has not yet ended, apparently, declines having occurred in the last week on bayos, blackeyes and limas. The decline, however, has been very gradual, and it is hoped that the demand will pick up before it goes much further. The movement for the last two months has been a little disappointing, leaving a fair supply on hand for this time of year, and a good many holders have become anxious to sell; while the apparent easing of prices seems more likely to encourage buyers in their attitude of holding off.

(On wharf, San Francisco.)

Bayos, per ctl.	$4.70 @4.80
Blackeyes	3.40 @3.50
Cranberry Beans	4.75 @4.85
Horse Beans	3.25 @3.50
Small Whites (south)	5.50 @5.60
Large Whites	5.75 @5.90
Pinks	4.30 @4.40
Limas (south)	4.40 @4.50
Red Kidney	6.50 @6.75
Mexican Reds	4.50 @4.65
Tepary Beans	4.00

SEEDS.

The general line of garden seeds is a strong feature now; but of the lines quoted alfalfa is the only one attracting much attention. This line is moving well at the old figures.

Alfalfa, per lb.	19 @20 c
Melilotus Alba	6 c
Melilotus Indica	6 c
Bur Clover	11 c
Oregon Vetch	4¼ @ 4½c
Soy Beans	6 c
Canada Peas	5¼ @ 6 c
Sudan Grass	40 c

HAY.

No. 1 Wheat	$13.00 @16.50
No. 2	12.00 @14.50
Tame Oats	12.00 @18.00
Wild Oats	12.00 @14.00
Alfalfa	15.00 @18.00
Stock Hay	10.00 @12.00
Straw, per bale	.25 @ .40

FEEDSTUFFS.

Prices for feedstuffs are unchanged, but quite firm, with a lively demand for all lines. Some Oriental middlings are arriving, but not enough to affect the market.

(Wholesale prices per ton, carload lots, San Francisco.)

Beet Pulp, per ton	$22.50 @23.00
Alfalfa Meal, per ton	20.00 @21.00
Alfalfa Molasses Meal per ton	21.00 @22.00
Bran, per ton	26.50 @27.50
Oil Cake	Nominal
Cocoanut Cake or Meal	23.00 @25.00
Cracked Corn	39.50 @40.50
Middlings	33.00 @34.00
Rolled Barley	29.00 @30.00
Tankage	45.00
Rolled Oats	29.50 @31.00

RICE.

A few good sized sales to mills have been made in the last few weeks, and the market on both rough and finished shows a better tone. The recent demand has been mostly for medium and low grades, but more call for high grades is expected soon. The various mills have so far been well supplied, but will soon be in the market, and lower prices would not hasten the movement.

VEGETABLES.

The feature this week is the increasing offerings of asparagus, the crop of which will be in full swing with another week of warm weather, and an unusually large shipping business is expected. The stock thus far has been very good, and moves well at declining prices. In other lines business shows more life, but most lines are still rather scarce, and some are coming from distant points. There are hardly any peas. Celery, artichokes, and sprouts are somewhat lower on larger arrivals.

Cabbage, ctl.	50 @60 c
Cauliflower, doz.	50 @75 c
Sprouts, lb.	5 @ 6 c
String Beans	10 @15 c
Peppers, bell, lb.	15 @25 c
Rhubarb, box	1.00 @2.00
Peas, southern, lb.	10 @12 c
Tomatoes, L. A., crate	1.75 @2.00
Eggplant, lb	20 @25 c
Celery, crate	3.00 @3.50
Artichokes, doz.	50 @80 c
Lettuce, small, crate	1.00 @1.50
Asparagus lb.	12½ @25c

POTATOES AND ONIONS.

Oregon and Salinas are a little higher. Delta stock is unchanged, but the crop is getting pretty well cleaned up, with the exception of one large lot now being dug. Delta onions will all be sold from storage in a couple of weeks, after which an advance is expected.

(On Wharf.)

Oregon Burbanks	$1.60 @2.05
Salinas Burbanks	2.10 @2.25
Delta Burbanks	1.10 @1.65
Sweet Potatoes, ctl.	2.25 @2.50
Onions, Delta, ctl.	1.85 @2.25
Oregon	2.00 @2.50
River Bermudas, crate	2.00 @2.15
Garlic, per lb.	10 @12½c

POULTRY.

Turkeys are neglected now, and live birds are lower. Chickens also have been rather quiet the last few days, and while broilers have been scarce, in some cases bringing a premium, other lines show no great strength.

Turkeys, dressed	25 @27c
Live Turkeys, lb.	19 @21c
Broilers, 15 lbs. to doz. and less, lb.	38 @40c
do, over 15 lbs. to doz.	30 @35c
Fryers	24 @26c
Hens, extra, per lb.	17 @18c
Small	17 @18c
Smooth Young Roosters, per lb.	20 @21c
Squabs, per doz.	2.00 @4.00
Geese, per pair	2.25 @3.00
Ducks, young, lb.	18 @19c
Old	14 @15c
Belgian Hares	9 @11c

BUTTER.

There is very little feature to the market, extras having been unchanged for two weeks, with supply and demand about even. Lower grades, however, are cleaning up well, and show a slight advance.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extras	32	32	32	32	—	32
Prime Firsts	30½	30½	30½	31	—	31
Firsts	29	29	29	29	-	30

EGGS.

There have been a few orders from outside markets until recently, but now the outside demand is about over, and with liberal supplies arriving over the holiday another drop is noted.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed
Extras	21½	22	22	22½	—	20½
Sel. Pullets	19	19¼	20	20	—	19

CHEESE.

All prices stand as last quoted, arrivals being rather light in all lines, though there is not enough demand to warrant a further advance.

Y. A.'s, fancy	18 c
Fancy Calif. flats, per lb.	17½c
Monterey Cheese	18 @19c

LOS ANGELES DAIRY PRICES.

Eggs	20	19	19	19	19	19

DECIDUOUS FRUITS.

Stocks of apples in storage on the Coast are lighter than usual at this season, but there is still a very fair stock, and holdings in the East are very large. The movement for the last week has been very slow, both locally and for shipment, and the market is rather easy than otherwise.

Apples:

Pearmain	.85 @1.25
Baldwin	.75 @1.25
Oregon Spitzenbergs	1.50 @2.50
Jonathan	1.25 @1.75

DRIED FRUITS.

The continued apathy of buyers in consuming markets has caused a further marking-down of prices at this end, the decline being also attributed by some packers to difficulty of getting adequate facilities for shipment, either to Eastern markets or to Europe. The drop in prunes is rather surprising, and it is not at all certain that it is waranted by actual conditions, though the statement is made in some quarters that the amount of stock still on hand offers little promise of better values. The Eastern market, however, is stiffening up again after a period of easiness, and there is a steady and rather large shipping movement from New York to Europe in several lines, prunes being the most important. With a long period to elapse before new stock comes in, there should be no difficulty in cleaning up all that remains, and at better prices than are now offered. Peaches have received no attention for some time, and this line also has dropped; but with most other lines well off the market, it should be possible to get better values before the new crop is ready. Raisins are in active demand, and the outlook is very encouraging for the coming season. The New York Journal of Commerce says:

"California 1915 crop prunes for February or March shipment from the Coast are firmer than they have been for several weeks. Prices are inclined to return to the level which has been held by the principal packers and the general feeling is stronger, forecasting an advance in prices within a short time.

"Buying interest in prunes is very quiet, no one seeming to be anxious to secure more than very small stocks. Medium sized prunes on the Coast are said to be growing scarce in many quarters and prices are relatively stronger on those sizes.

"California raisins are very firm on spot, with stocks available only in fair supply. Coast operators report that prices are strong in California, with a good foreign inquiry. Shipments from New York continue to be made in heavy quantity. Shipments for the final two days last week totaled 425,000 pounds, England being by far the largest buyer."

Imperial Clusters, 6-crown, 20-lb. box	2.50
Bulk, layers, 50-lb. box	2.75

CITRUS FRUITS.

The eastern fruit auctions show lower prices paid for oranges, owing to heavy receipts, but as shipments from California have been held up for the past ten days the market will soon right itself and good average prices are expected.

At New York on Monday, Feb. 21st, oranges averaged on auction from $1.45 up to $2.80 per box, and lemons sold for $2.15 up to $2.55. At Chicago the same day oranges averaged from $2 to $3 per box. Lemons averaged from $3.50 to $3.75.

Total shipments of oranges from southern California up to Feb. 21st, were 6,788 cars, as against 5,895 to same date last season.

San Francisco business has been less active for the last few days.

HAY BEING SHIPPED TO THE ALLIES.

The hay market is exceedingly firm, local prices having been marked up again this week. This condition is due in part to the recent sale of 2,000 tons of wheat and oat hay, and a similar quantity of alfalfa, for shipment to Europe, and in part to a car shortage, which has made it impossible to bring in the usual amounts from storage points; as well as to the continued heavy demand for feed in nearly all parts of the Coast. The hay for Europe is going by Galveston, being put up in double-compressed bales. The market has been greatly relieved by heavy export shipments throughout the season, as well as by a larger home demand than was expected, and all offerings are expected to clean up by the time new hay arrives, stocks of alfalfa being already about cleaned out. The outlook, however, is for a large crop, and a good deal of grain land will probably go for hay.

Special Live Stock Market Report.

The only material change in the local beef market is the growing demand for lightweight cattle and this demand continues to grow stronger all the time, with only slight response from the country. Heavy cattle remain unchanged as last quoted.

Sheep and lambs have been scarce and it is thought will bring a higher price. There have been a few ewes on the market, but the wether situation remains the same. Practically all arrivals are from Nevada or further eastern points. No spring lambs are looked for before the middle of March.

Hogs are not offered very freely in California and the market here is strong at an eight cent top with prospects of a still higher market next week. California has been furnishing all of the hogs for this market but shipments from Utah and Idaho are expected to move in this direction more freely next week.

WOOL.

Wool buyers are still busy contracting for wool in Nevada, but with the exception of one contract reported in these columns last week, there does not seem to be anything doing yet in California. The highest price reported from Nevada is 22½ cents. The eastern market is about the same but fairly strong, and there is a tendency to stronger prices on coarse wools. The foreign markets show a little easing up in fine wool, but this is not expected to affect the local situation. There are still a few lots of old wool in growers' hands, but in general the State is better cleaned up than it has been for several years, at this time.

Prices on navel oranges and grapefruit are well maintained, while tangerines are lower. Lemonettes and fancy lemons have been marked up a little.

(Wholesale prices, San Francisco.)

Oranges, Navels	$1.50@2.75
Tangerines	1.00@1.25
Grapefruit	1.25@2.50
Lemons, box	1.75@3.50
Lemonettes, box	1.50@2.00

HONEY.

Local conditions show little change, except that the market shows gradually increasing strength, with really attractive offerings getting down to narrow limits and little coming in, while buyers take increasing interest. Requirements for the local trade, however, are not large.

Water White, comb	13@15 c
Amber	8@12 c
Water White, extracted	7@ 8 c

Dark	2@ 2½c

NUTS.

In response to queries regarding the almond quotations published during the past season, it may be said that the figures were the reguar quotations given out by the Almond Exchange, as its selling prices to the trade. The various expenses of doing business, cost of bags and other materials, etc., amounting to 1 cent or more per lb., must be deducted before the returns to members can be named, and this naturally cannot be done until the season is over, when expenses are figured out. The Exchange has been out of spot stock for some time, and now has taken all the orders subject to approval of price that it dares to accept, showing that, notwithstanding the good crop in prospect, there is a very large demand. There are still a few odd lots of walnuts, but these are gradually cleaning up, and Oriental stock is also about sold out.

(Prices f. o. b. San Francisco.)

HORSES.

There have been no notable offerings in San Francisco for some time, though a few sales of more or less interest have been held at outside points. The demand at present appears to be most active in the country, though there is always a market here for desirable draft stock, and good horses of medium to heavy weight for contractors' use are expected to get some attention later in the season.

(Approximate values in San Francisco, based on auction sales.)

Publisher's Department

A letter from the United Fruit Company of Newcastle, says: "We have received very fine results from the advertising with your paper and the only reason we are cutting the advertisement down somewhat, is that we are practically sold out of most of the varieties."

A new book entitled "Selected readings in Rural Economics" by Prof. T. N. Carver, has just been issued by Ginn & Co. of 29 Beacon St., Boston. The chapters cover general principles, agricultural history, land tenure, agricultural labor, the farmer's business, agrarian movements in the U. S., rural organizations and marketing, agricultural policy. The book contains 970 pages, well bound, and the intrinsic interest of the subject and the notable authorship will assure careful attention. The price of the book will be furnished by Ginn & Co.

If all of our readers knew of the value of our new book, "Second Thousand Answered Questions in California Agriculture," the edition, large though it is, would not last two weeks. We are selling lots of these books, but we want to supply every reader possible with a copy while the edition is fresh from the author's pen.

As the rainy season is nearly over and farm activity begins, our readers will find the need of referring to printed matter for information a necessity more and more frequent. Whether the information wanted is along tree planting lines, gardening, floriculture, stock feeding or poultry practice, we have the books that will help you. The list published by the Pacific Rural Press is printed in another column, and we will be pleased to fill your orders.

CHANGE IN CALIFORNIA CURED FRUIT EXCHANGE.

At a meeting of the Executive Committee of the California Cured Fruit Exchange, held at San Francisco this week, Wm. Jas. Hill of Shasta Co. was elected to the position of Secretary-Treasurer, in place of S. O. Walker. The business of the Exchange will be continued as before this change was made.

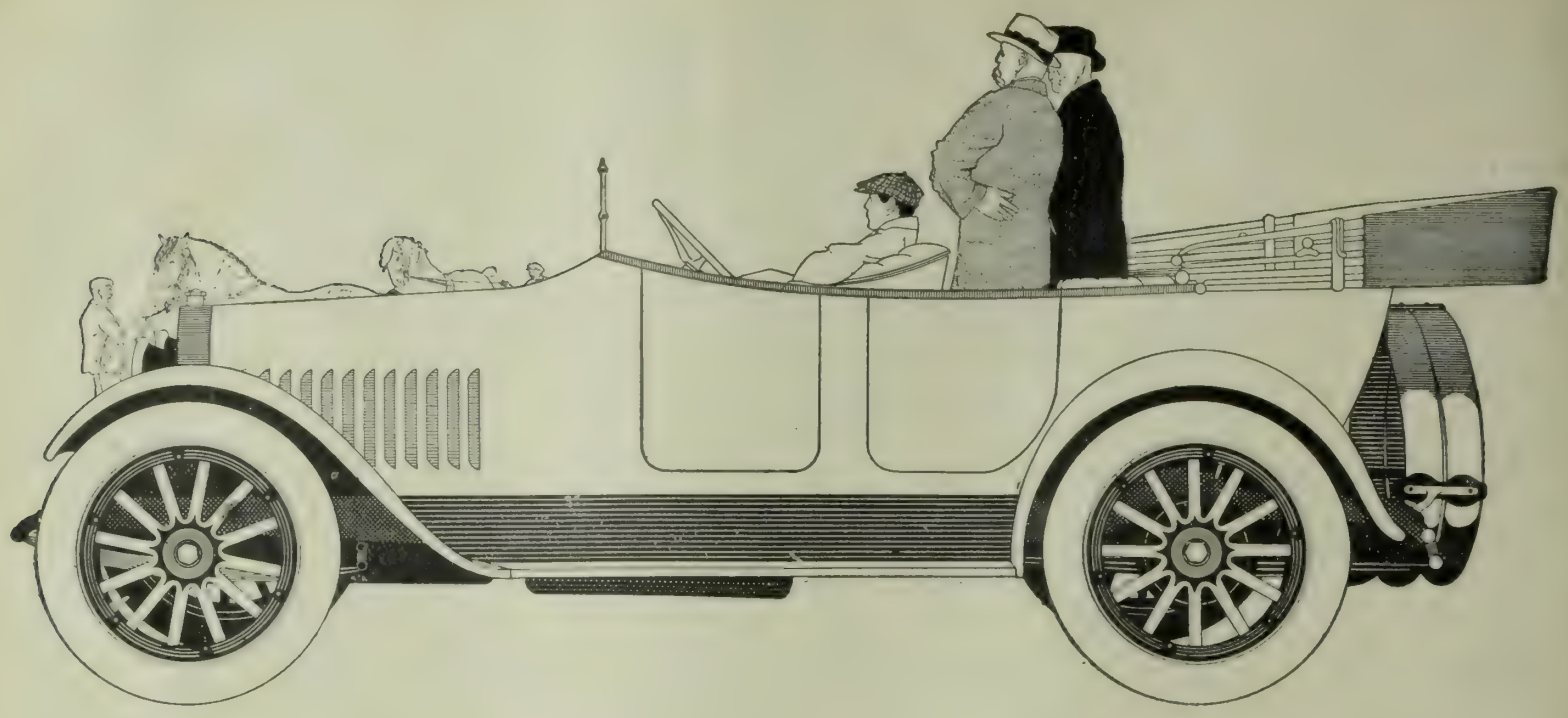
Planet Jr. Beet Cultivator



—greatest time- and labor-saver for beets and beans

This No. 3 Planet Jr 4-row Sugar-Beet and Bean Horse Hoe cultivates 4 rows of beets at a time, 18 to 22 inches apart. The patent shield hoes run close without covering plants or injuring roots. All steels, specially hardened, hold shape, keep sharp, and add 50 per cent to wear. Two styles of beet-cultivators—lower prices than ever before. Fully guaranteed.

New 72-page Catalog (184 illustrations) free! Describes over 70 tools including 17 entirely new ones and improvements to our Cultivators, Horse Hoes, Harrows, Seeders and Wheel Hoes. *Write for it today!*

IT'S A COMMON-SENSE CAR TO DRIVE—THIS 3400 R. P. M. CHALMERS

Great energy in an engine will do one of two things.

It will either deliver great power or great all-round performance. But it won't do both.

It was up to Chalmers engineers to decide which of the two would be the more desirable in the new 3400 r. p. m. Chalmers.

In early road and laboratory tests of this phenomenal engine's energy they found that it developed superfluous power.

The might of this small engine was amazing; the temptation to let it deliver its full measure of might was tremendous.

But Hugh Chalmers said: "Might isn't everything. We can't afford to sacrifice performance to power. Keep her horse-power down. Get long mileage on gas—quicken her acceleration. Make her perform."

So it was decided that the headlong power of the 3400 r. p. m. Chalmers must be held in check—by the curb-bit of fuel-economy.

Thus it added mileage to might, made every gallon of gas kick in with 18 miles of wonderful flight, with an uninterrupted flow of silken, miraculous acceleration, and speed up to sixty miles an hour.

But bore, stroke, and engine speed remained unchanged. It still recorded its 3400 revolutions per minute.

As long as motor cars run on gasoline, extreme racing speed will be as prohibitive in cost to the average user as extreme racing speed in a horse.

A Dan Patch is not for the average stable—an interesting sort of beast, but pretty useless when it comes to the prosaic requirements of the day's work in town or country.

When Mr. Chalmers refused to O. K. the sacrifice of all-round performance to mere brute might, he saved the owner of the 3400 r. p. m. Chalmers from $150 to $200 per year in cost of gas.

And so it's a common-sense car for a farmer to drive, because thrift is the first law of scientific farming. This car does not require a big burnt offering on the altar of useless might.

Its pick-up and ease of control will astound you the moment you set foot on the accelerator button. You can shoot ahead of another car's dust at will. No jar or sidesway—always four wheels on the road—you slip up the hills on high—your direction is straight and true.

Big and roomy; 115 inches of wheelbase; Westinghouse starting and lighting; deep, rich, genuine full-grain leather upholstery; stunning color options.

The next time you go to town, go and see this car; you feel already that this is the car you must own.

THE PACIFIC RURAL PRESS

California State Library

SAN FRANCISCO MARCH 4, 1916. LOS ANGELES

California's Ettersburg Strawberries.

The Pacific Rural Press was the first to give the world a systematic account of a wonderful new race of strawberries produced upon the basis of wild species and varieties found on our sea beaches. This work has reached striking results, which are described by their author for our readers.

[Written for Pacific Rural Press by Albert F. Etter, Ettersburg, Cal.]

TEN years ago, in the early spring of 1906, some of the older readers of the Pacific Rural Press may remember that in writing of what was before me in hybrid chiloensis strawberries, I said we were to have these very vigorous and robust plants that "would be wonderfully productive, evergreen, and everbearing."

Speaking of prophets, they may be very conveniently placed in three different classes, as follows: the real thing, or those who are able to foretell what is to happen; those who just guess what is going to happen and by luck strike it right; and those who see clearly ahead and tell what is going to happen long before the general public see any sign of what is coming. The writer is in the latter class and his best claim to modesty is that he usually gets far more than he promises. Or, to be more frank, he is no prophet at all and nothing to boast of as a keen observer, inasmuch as he only sees a few of the things that are taking place before his eyes.

This preamble gives us our bearings so that we may now announce that the statement of ten years ago is not only verified, but in getting it I have brought to light many other things that should delight all lovers of fine strawberries. From an educational point of view, for the person who likes to look backward from results, tracing their origin step by step, it shows how wise we may be if knowledge is limited to only a few facts; yet, still how stupid and shallow we are in our groping with a poor light, with the desire of our ambition lying in the open before us.

It may be remembered that when I crossed the Rose Ettersburg (the R. E. is a hybrid between the Peruvian sand strawberry and a third generation seedling, Sharpless X Parry) with the robust wild beach strawberry (a species of F. chiloensis), I got a plant that, though of remarkable vigor and a profuse bloomer, was almost absolutely sterile. Indeed, I had this plant for ten years before I saw its first berry; yet it should be remembered, if you would get the point in this story, from first acquaintance I said this worthless plant (known on my records as Ettersburg No. 20) had great possibilities in it.

When the No. 20 was produced, I emasculated another blossom of Rose Ettersburg and pollenized it with a blossom from our little wildwood strawberry (F. Californica), and produced another nearly worthless plant; but it did at least have the merit of producing some inferior fruit. Now, it would seem that I had made two worthless crosses; but, with a fighting chance, thought maybe a second generation would give a turn-up worth while. Foiled completely in the Rose Ettersburg X Beach hybrid (No. 20) (and I did want to show deep genius so badly); so all that was left for me to do, as the blossoming season was now passed, was to save seed of the Rose Ettersburg X California plants, and maybe I could make a cross between the two later on. But many a genius has slept his life away when he should have been working; and when he awakens he finds that opportunity has fled.

How a Bug Became a Genius.—So it is to be told on me, that while dreaming of what I was going to do, some pesky wasp, bee, or thrips (a tiny insect no larger than the point of a cambric needle) cross-pollinated my Rose Ettersburg-Californica blossoms, and instead of a second generation, all I got were multo-hybrids, showing the unmistakable impress of their male ancestor, Ettersburg No. 20. Ettersburg No. 80, 84, 91, 93, 111, and 112 all came out of this lot of seedlings. Truly, I got the results; but the bug had the genius end of the game. At the time this work was going on, I made a cross on the Michel's Early, pollinated with Rose Ettersburg. Both these parents are large, thrifty growers; but the only plant that ever left its blood in my work with strawberries was a puny little female plant whose fruit was of no value. Indeed, the plant was worthless from any point of view except to a genius, or a "wizard," as some people would like to term him. But alas! I was no wizard in a situation like that. Truly, I did use this plant in making a cross with the Alpine strawberry, but I did so because it was a helpless little female, and it was growing right in the dooryard. That may be opportunity—but genius, never. The progeny of this cross was vigorous and productive, but not very reliable. One of these was Ettersburg No. 114.

TREBLA—A New Evergreen and Ever-Bearing Strawberry. Variety believed to be capable of yielding twenty tons to the acre and full sister to another seedling, which is practically unproductive. One plant of this variety was thirty-eight inches across and had 125 fruiting crowns.

Ettersburg No. 80 (distributed by the Pacific Rural Press) is well known in California, where many people in various parts of the State esteem it as a variety of sterling merit. No. 84, a sister of No. 80, is less well known. It has a more delicious berry than No. 80, and is more of the texture of the ordinary strawberry. It is a stronger grower, and has the reputation of being an all-summer variety in favored localities.

How Trebla Came.—In a certain cross between Ettersburg No. 114 and No. 84, producing only a few seedlings, two very remarkable varieties came into existence. Both of these produced well at two years of age; but one of them has never produced any berries to speak of since. However, the plants are immense in size. One I measured was 38 inches across and had 125 crowns. The other variety was formerly known as No. 222, but it now known as "Trebla." Trebla sounds as though it might have some relation

California Weather Record.

The following rainfall and temperataure record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau, at San Francisco, for the week ending at 5 p. m., February 29, 1916.

STATIONS	Rainfall Data: Past Week	Seasonal To Date	Normal To Date	Temperature Data: Max'm	Min'm
Eureka	.67	29.68	31.55	64	36
Red Bluff	.66	18.36	17.64	72	38
Sacramento	1.20	17.00	13.95	66	44
San Francisco	1.12	25.55	16.33	70	48
San Jose	.59	15.10	11.64	72	40
Fresno	.68	9.84	6.48	68	42
Independence	.12	9.68	6.34	60	—
San Luis Obispo	.90	24.42	14.08	76	40
Los Angeles	1.62	18.97	10.96	78	50
San Diego	.40	11.49	7.31	72	50

THE WEEK

WE ARE writing on February 29th—a thing possible only once in four years, because it requires 365¼ revolutions of the earth on its axis to fill the time needed by our planet to make its circuit of the sun. As it is impracticable to introduce a fraction without abandoning the obvious advantage of making the diurnal revolution our time-unit, we are obliged to jump a cog in the wheel once in a while to catch up with our proper relation to the sun, which, in the long run, is by far our most important thing to maintain; for the year, and not the day, is the standard of measurement in the solar system to which we belong. On this well-known phenomenon and the fact of our human attitude towards it, we wish to base the suggestion that in purely human affairs we shall also be wise if we jump once in a while from the path in which we have been running to another path which seems to have a clearer upward grade. To one climbing toward a ridge by using the trails of grazing animals, this is so familiar that the method is almost unconsciously adopted. In affairs less material and obvious, we do not adjust ourselves to upward courses so readily. We need to think about it and to discuss directions in which different courses seem to lead, to be sure that a present path carries us only on a level or downward, and that a new path, to which we can leap, is surely upward. This is the exercise to which we invite the reader of these columns this week. We take the general theme: what should the future course of our State executive horticulture be? It is timely to discuss this theme, not only because it is leap year, and we think that we ought to jump to a somewhat different path to go upward, but because Dr. Cook has announced his retirement and thus opens the way for a change. And though we shall proceed to consider such a change, not abstractly, but somewhat concretely, in the light of recent events which seem to us significant, and though we shall make free use of personalities, as signs of tendencies and dispositions which we think should be avoided and abandoned, we have no personal ill-will to gratify nor any personal interest to serve. We have reached an age which is out of hearing of the call of personal ambition—except to do well, and in the public interest, the few things which many years have taught us to do. And we would deny no man his right to that same liberty and pursuit of happiness. But, naturally, there will be different views of what constitutes truth and value to the public interest, and between such different views the public itself must decide.

We believe that the State institution for the executive advancement of fruit-growing should now leap to a clearer upward pathway. It has drifted along until it has become entangled with other institutions made for public instruction and for research, and is duplicating their tracks across territory in which they hold the right of way; it is building barricades across the advance of legitimate and necessary business interests; it is at war with itself on the matters of inspection and interior-quarantines, as we have already pointed out, and it is doing such things because it has no proper conception and grasp of other things which are just now most important to do. But this is all in the abstract; if the reader please, we will now proceed to shovel the concrete.

WHAT MADE MOSES GREAT?

FOR thirty-five years California's executive horticultural work has been largely pest-killing and exclusion, and the effects of it may be conceded to have been incalculably valuable. It was given that turn by Matthew Cooke, of blessed memory. There was no entomologist in the State in 1880 who believed in pest-killing, so Matthew boxed his compass as a box-maker and started out in that direction, blindly but zealously and efficiently. It was a great emergency and he rose to it. Since his time conditions have radically changed; the University has educated an army of trained pest-killers; barrels of manufactured insecticides and fungicides are easier to buy than beer; spraying machinery is freely and enterprisingly advertised by manufacturers; full information of pest-killing preparations and the use of them is given continually in our agricultural journals and books and in the circulars of the county horticultural officers. Thus, whosoever will can clean himself of pests and the State should see that he does it, largely by commercially pinching out poor fruit and the growers thereof, as has been suggested—with whatever police regulations may be necessary thereto. When this is agreed to our State executive horticulture can be largely in the line of commercial pomology, which is now our greatest need. And commercial pomology is a more important industrial thing than pest-killing, which is only incidental to it. Let the State advance along this broader, higher line of promotion for fruit growing; let State officers demonstrate how better fruit can be sold, more profitably to good growers and more cheaply to a world of consumers. If the State can make all the fruit which goes on sale, good for something, the problem of greater profit will be at least half-solved. Such work by the State will also be the greatest possible advertisement of our product in the eyes of the world.

Now Moses was the greatest pest-killer of antiquity, and for swatting flies and bouncing grasshoppers and frogs he has had no rival to this day. But let it be remembered that it was not these achievements but his release of people from bondage and his establishment of the greatest commercial race on earth which gave Moses rank among the most distinguished of mankind. Our conviction is that our fruit interests require, not a bug-killer, but a pomological Moses with such new laws as he may need to enable him to proceed toward making fruit products more profitable. We are face to face with a commercial, not an academic problem.

HIRED AND FIRED!

THE committee hired by the Visalia Fruit Growers' Convention to move toward the standardization of the horticultural laws of the State was fired by the San Bernardino convention—that is, almost. As shown by the report in our last issue, Dr. Cook is the lone survivor of the old committee. It reminds us of the story of the eagle and the owl. A little owl, hard pressed by a hungry eagle, made a quick dart into a squirrel hole, but the eagle swooped and pulled out all his tail feathers. The little owl, in the refuge of the squirrel hole, turned his head to observe the extent of the injury and exclaimed in thankfulness: "By gum, I have lost my tail, but I have saved something!" And so it is with this committee: it is almost a total wreck—all hands lost but the cook!

So far as anybody cares what happened to this committee, the formal firing of it by the San Bernardino convention is simply funny. But in its relations to courtesy and consistency between the consecutive conventions of fruit growers, the operation at San Bernardino was high-handed, dangerous and illegal. The transactions of the Visalia convention were complete, the body adjourned sine die and its transactions must stand forever. Other conventions can ignore its transactions, or can undertake other transactions which would render earlier ones of no avail, but they can no more abolish these earlier transactions than they can obliterate a page of history. Dr. Cook ignored the Visalia transaction by never calling its committee together, and that he had a perfect right to do (the wisdom of the action being an entirely different question); but to undertake to invade the transactions of the Visalia convention, which was clearly within its rights in making them, is a petty manifestation of the same attitude over which Europe is now at war. We do not expect Dr. Cook to see this. He has given the attorney general's office a busy four years in the effort to teach him that he is a creature of law and not the creator of it, and yet he does not seem to have retained much impress of the effort. And even that does not much matter. The danger in the lack of respect for an earlier assembly, which the San Bernardino convention was induced to manifest, is that it opens the way for all sorts of personal malice or stupidity to attempt to re-write history for its own purposes and that will very soon reduce the interest which California fruit growers take in these unique assemblies and thus destroy their influence. Dr. Cook had done enough previously to prostitute these conventions to his own mistaken purposes. In this last transaction he has used dynamite to secure his own way, which he could have secured just as well by doing nothing at all. For the Visalia convention placed its com-

mittee in his power just as completely as the San Bernardino convention has done. Whatever he does, then, he will be still following the lead of the Visalia convention. The personnel of the committee is not a matter of any importance, and yet that seems to be Dr. Cook's only reason for invoking this vain and illegal ruction.

DR COOK WILL RETIRE.

WE ARE sorry that Dr. Cook had to announce at the San Bernardino convention that he would soon retire from the State commissionership of horticulture because of ill-health or the fear of its approach. We wish every one with whom we have to do, or try to undo, to feel like a fighting cock—for then there is some fun in the game. We are honestly sorry that Dr. Cook ever felt impelled to put his health to such a strain as he has valiantly endured during the last four years. We would like to emphasize that point, but Dr. Cook would not believe it honest and would charge it up to us as some new kind of a slam. But we are sincere, because we have a conviction that a round plug never did and never can feel good in a square hole. There must always, in the nature of things, be some stress upon the central tissue in the effort to fill the corners without bulging the sides. And this is what Dr. Cook has been trying to do for four years. He should have a rest, but we are sorry that he needs it. Perhaps there is no more significant indication of his inappreciation of the fitness of things than his misplaced desire to relieve Governor Johnson of the responsibility of making appointments, by naming his own successor. For one of the San Bernardino resolutions said of Frederick Maskew, in nominating him for State commissioner, many good, true and well-deserved things, and pointed its pyramid with these words: "Who will maintain the same high standard of practical and scientific efficiency which has characterized the administration of Commissioner Cook." Think of that: offering to help the governor to make an appointment guaranteed to be just like the last, which has given him more trouble than any other he has made in the whole course of his administration! The governor does not need that kind of help, and Mr. Maskew does not deserve such a handicap. It is the same old, round plug in a square hole.

Besides, the use of a fruit growers' convention as a nominating agency for an executive appointment is an outrage upon the history and traditions of over a third of a century. If the action at San Bernardino should be accepted as a precedent, the end of these beneficent popular assemblies will be clearly in sight.

WHY NOT MR. MASKEW?

AS DR. COOK'S appointment of his successor is, we presume, subject to ratification by Governor Johnson, it is still proper to speak of it without personal prejudice, and according to one's conviction of what is for the public interest. Mr. Maskew is a man capable of original thinking, of good reasoning power, of independent and self-reliant judgment, of firm decision and unswerving action. He is also fully possessed of the exact knowledge which the foregoing mental traits need for intelligent operation. He has also clearly demonstrated ability beyond question in technical executive matters. In all these things he is a square plug for a square hole, but Mr. Maskew is an academician. That brings us to a brief re-statement of the conviction which we have expressed before, that in the emphasis which has been placed upon certain lines of work the administration of our horticultural laws hitherto has not brought State aid to meet the greatest present needs of our great fruit industries. It is true that the laws themselves have been turned too far aside from these greatest needs, and that is explained by the fact that each succeeding horticultural executive and his supporters have secured laws fitted to their own waist measures. That is one of the reasons why these laws need a thorough overhauling. In a way, they are too largely academic and not sufficiently industrial and businesslike in their points of view and their subject-matter. They have exalted the killing and control of pests overmuch—losing sight of the fact that research and extension teaching are the proper sphere of other State institutions—and the other fact, that if the State will make fruit-growing more profitable by regulating and promoting trade, the business will induce the growers themselves to fight for it and be eager to kill their own pests—which is really only an item of successful production. To bring this about it may be necessary to have all the protective provisions, and officers to enforce them, which we now have; it may be even necessary to have more and better provisions and officers. We are not claiming that existing safeguards be relaxed, but that they should be made more rational and consistent and be no longer regarded as the greatest function of our State executive horticulture.

WHAT THE STATE SHOULD DO FOR FRUIT.

BY INSISTING that the State shall do for the fruit industry broad economic and commercial work, and by gradually requiring that growers learn to handle their own producing problems largely, with proper penalties against those who endanger others, we shall come to serving this industry better by State enactment and executive activity and develop, among individual and associated growers, a spirit of understanding and control of incidental difficulties of production, perplexing though they may seem to be. And this result is to be attained, it seems to us, by getting the greatest possible amount of good fruit and food products into the hands of a world of consumers at a minimum cost of distribution; by getting all the bad fruit into hopeless unprofitability, by condemnation or otherwise. When this is done, most growers will attain to something like the efficiency in pest control which our best producers already manifest, and all others will be pinched out of the business by economic laws or by penalties against pest-breeding. We see no future for pest reduction by paternal effort to protect and perpetuate what should be blotted out as imbecile and unprofitable.

We have mentioned only one line of statesmanlike executive work for the extension of our greatest industry, which California should push forward. To mention others would only be to multiply instances of which there are many. As we think of these things we are firm in the conviction that there should be a radical change in the point of view and policies of our State horticultural work. Mr. Jeffrey saw a great light a few years ago, but that now appears only as a glimmer through the nebular hypotheses of Dr. Cook. Our conviction is that the next State Horticultural Commissioner should be a man of experience and mastery in the growth and handling of commercial fruits; a man who knows the value of academic things and how to use them to advantage; who could organize the State fruit work for the greater profit of fruit growers; who would enlarge the scope and dignity of Mr. Maskew's work and not mess in it; who would have intelligent initiative and experience to bring to the support of Col. Weinstock's efforts; who would remember the past, but press forward to better things. We have no candidate. Qualified men can be found in all parts of the State.

Queries and Replies.

Querists must give name and address.

Currant Mildew.

To the Editor: What shall I do with currant bushes which get full of mildew soon after they bloom, and when starting to ripen the berries are covered with a crust.—H. K., Oakland.

Spray now with lime-sulphur to clean the canes and then powder the leaves thoroughly with fine sulphur after the blooming if you see the trouble appearing. Apply when the leaves are wet with dew, if possible, for it stays in place better.

Bad Creeping Grass in Lawns.

To the Editor: I am sending a sample of grass that is coming up in my blue grass lawn. Please tell me what it is, and is it liable to run the blue grass out?—G. M., Carpinteria.

Whether this is one of the sneaking grasses which they rather enjoy calling "devil grass" (with proper emphasis) at the south, and whether its nature perhaps entitles it to rank with Bermuda in the deviltry it may play with a blue grass lawn, we are not sure. It does, however, belong to that horticultural group of creeping, joint-rooting intruders, although it has botany of its own. Frank J. Smiley of the Botany department of the University tells us: "The plant is Agrostis stolonifera, commonly called "Water Bent-grass." It is a native of Europe, but has been introduced into southern United States and into California as a pasture grass and is likely to spread in low moist places. Some of its varieties become troublesome weeds in Europe, where it is reported that they are sometimes difficult to control."

Possibly, however, the whole situation is not quite so easy as that because there is a variety of the species, stolonifera, which has some horticultural standing as a lawn grass and may be included in some "lawn-mixtures" offered by seedsmen. But whether you have the one agreed to be bad or the other which some hold to be good does not matter much if its different hue in the lawns offends you by color or by the patchiness which it produces and its disposition to become rubbishy on the surface. We can only suggest that it it does offend, the only treatment can be to grub it out when the ground is safe—pulling out, of course, as many long rooting-joints as you can. It is possible that you encourage this grass by keeping your lawn too continuously wet. If so, keep your blue grass growing by using a larger amount of water at longer intervals. This is the right way, for several reasons.

Sparks from the Citrus Convention.

[Written for Pacific Rural Press.]

MATURITY STANDARD OF 8 TO 1.

Fred Mason, Oroville: Nature shows when oranges are ripe by the color.

We do not believe in sweating to bring color to conceal inferiority.

Butte county conditions are such that the 8 to 1 standard is unjust.

W. W. Hinsey, Fair Oaks: The 8 to 1 standard is the great menace to the citrus industry of the north.

In one season it cost Fair Oaks 50 per cent of the crop, or $30,000.

Sacramento county oranges are on the verge of rotting when they have gained 8 parts soluble solids to one of acid.

They are the finest oranges in the world when they test 7 to 1, according to letters from customers.

We printed this season a notice of our olives on each orange wrapper, and in our returns on that we are getting letters from many parts of U. S. and Canada saying our oranges this season not shipped under the 8 to 1 test are the best they ever ate.

Many Fair Oaks oranges test as high as 15 per cent solids, a very high sugar content, but because they had 2 per cent acid, could not be shipped as 8 to 1 fruit.

Hobart Webster, Porterville:

The 8 to 1 standard saved Tulare county from ruin.

The question is not, "How much does it delay shipments from unfavored locations," but "How much more will a consumer buy after he eats the first oranges."

Before the 8 to 1 test was announced in 1914, the growers were getting desperate. As the yield increased, and the worse the conditions became, the earlier they shipped the fruit, because only the earliest shipments were bringing any money.

Since 98 per cent of the Tulare oranges were held for the 8 to 1 condition, not only Tulare but all of Southern California has benefited. Nearly 100 per cent of the growers are still in favor of the standard.

For the week ending Dec. 25, 1915, the Cal. Fruit Growers' Exchange, which sells only 8 to 1 oranges under its advertised brands, sold on the New York auction 17,806 boxes of oranges averaging $3.06. Outside interests at the same time and same place sold 9,964 boxes, some up to standard, some not, averaging $2.53. During the next week the Exchange sold 18,394 boxes averaging $2.53 while outside interests sold 9,964 averaging $2.14.

If, by good care, your soil or climatic conditions are such as will not produce fruit that is up to the government-suggested standard by the time it is colored, it is up to you to defer shipment until you can offer the consumer an orange that is good to eat.

W. L. Crowe, Lindsay: There are a few orchards in Tulare county that produce fruit early in the season, of high color, high sugar, and high acids, but which would not stimulate demand for another.

Some of the "earliest" fruit in Tulare county has proved to be the latest. It is very largely a matter of proper care of the orchard.

E. M. Chace, U. S. Dept. Agr., Los Angeles: Color of fruit can be regulated by manipulation of the tree.

Butte county has very little reason to object to the 8 to 1 standard. Of 11 growers who sent sample fruits regularly one had 8 to 1 fruit Nov. 4, 1915, two weeks before Tulare county came on, though 80 per cent color did not come until Nov. 25 except on one sample.

One orchardist couldn't get water for a month when he needed it. His oranges colored beautifully, but would not come up to the standard so early as his neighbor's. Last season, with plenty of water, he came up to standard two weeks ahead of the same neighbor, who in turn had water trouble.

Oranges with 15 per cent or more of solids and a high acid are characteristic results of lack of water.

Fruit lacking water colors beautifully, but is so sour that no very extensive number of people would buy the same kind twice.

MAKING NITROGEN AVAILABLE.

Prof. W. P. Kelley, Riverside Experiment Station: In converting the ordinary forms of soil nitrogen into the soluble nitrate form in which it is available for plant food, organic matter to support bacterial life is one of the most important factors.

Manure is slower to nitrify (its nitrogen to change into nitrates) than green cover crops plowed under.

Barley straw and similar bulky materials tend even to temporarily reduce the nitrates in the soil. Bacteria breaking down the cellulose of straw use nitrates, converting them into less soluble forms. These ultimately may be rechanged into nitrates, but meanwhile other nitrates should be supplied.

Small amounts of alkali or other soluble salts interfere with nitrification.

Most Southern California soils have nitrifying bacteria which will work on any of the common forms in which nitrogen is applied, provided they have organic matter and chemical and physical soil conditions that are favorable.

One of the first products of the decomposition of organic matter is ammonia gas, which unless quickly combined in moisture, escapes to the air and is lost.

NITRATE MOVEMENTS IN SOIL.

Prof. I. G. McBeth, Riverside Experiment Station: The brown soil incrustation often seen after orchard irrigation sometimes contains 100 times as much nitrate as the same amount of soil from 6 inches below.

These nitrates are unavailable to the trees whose roots cannot reach them on account of frequent cultivations and drying of surface.

They get there by being dissolved in furrow-irrigation water which evaporates from the surface of the soil and leaves them behind.

Soils fertilized heavily with nitrogen as compared with similar soils unfertilized, had four times as much nitrate in the upper six inches in Sept.; about twice as much from 6 to 18 inches deep; and just a little more 18 to 30 inches deep. Winter rains carried the nitrates down so that there remained scarcely any more in the upper 6 inches of the fertilized than the unfertilized plats; but four times as much 18 to 30 inches deep.

Furrow irrigation when water evaporates from the surface, shoves nitrates sidewise and upward so their greatest concentration is at a line along center between the furrows. In heavy soils, if the water from two furrows does not meet between them by seepage, the concentrated nitrates are left in two lines.

The way to realize greatest value of nitrogen fertilizers is to plow them under deep furrows so they will be in reach of the roots.

To keep them down, flood irrigation will be necessary with prompt cultivation to prevent capillary rise of the water and deposit of its dissolved nitrates at the surface.

Cover crops use much of the surface nitrogen, locking it up in insoluble forms during the rainy dormant season, but nitrifying quickly when plowed under deeply in tree-growing season.

WHAT WE KNOW ABOUT FERTILIZERS.

Director H. J. Webber, Riverside Experiment Station: There are only "mighty few things of which we are fairly certain."

The need of organic matter to aid in making fertilizers available and to keep soil in proper physical condition needs to be re-emphasized.

Wherever melilotus has failed as a winter cover crop, the trouble is probably wrong methods. It does grow successfully in most soils.

Melilotus is the best cover crop we have. We want a better one. It does not grow fast enough in winter. Perhaps a strain may be developed which will grow as fast in winter as purple vetch.

Cover crops fix nitrogen until danger of its leaching away is gone.

It would pay to buy alfalfa at $8 to $10 a ton to use as fertilizer for the nitrogen alone. But alfalfa also contains potash, sulphur, and phosphoric acid which would be a clear gain, as well as the improvement of the soil by addition of protoplasm and organic matter.

In alfalfa we have one of the strongest and best nitrogen fertilizers we can use. The hay becomes available as plant food two or three weeks after it is plowed under.

California ought to grow all the nitrogen fertilizer used in California.

Alfalfa may ultimately be fed to stock and the manure used more economically, but orange growers can hardly be stock growers.

Nitrogen is the next most important to organic matter. You get a nitrogen reaction right away, but usually not so with potash and phosphoric acid.

Nitrogenous mulches such as alfalfa and bean straw are likely to be more or less wasted unless they are disked into the soil. If top mulch is to be kept on, it had better be of a cheaper kind such as straw.

[Dr. Webber's statements are supplementary to the outline of his address given on page 252 of our issue of February 26.—Eds.]

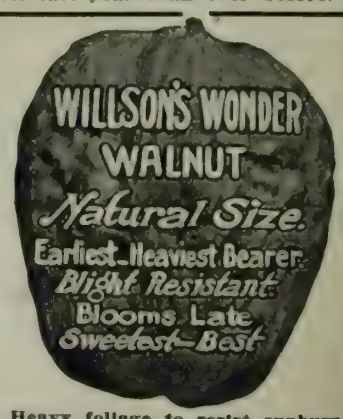
PLANTING AFTER BLASTING.

To the Editor: I am planting quite a large almond acreage. We have had an unusually trying year for work. We blasted the holes and planted the trees in holes that were quite wet. In fact the bottoms of these holes were soft. We tried hard to bar down any cavities or chambers formed by the explosion but in spite of this I find that the rains have settled the ground and also the trees in the holes a great deal. Now these trees were planted with the stump of the bitter almond —where it was budded—just about level with the ground. I find now that the bud is down in the ground from two, three, four, and in a few extreme cases, six or seven inches below the surface. Will you kindly advise me just what I should do?

Will the bud grow up any as the tree grows this spring?

Will the tree do well with the bud so deep in the ground?

Should I dig up those that are from five to seven inches and leave those that are two to four inches below?



I was advised by some one today that the bud would grow up, but am inclined to doubt it. I could hardly dig up the entire acreage that has settled, but I could dig up the worst ones—say a few in each acre—and replant. The holes were dynamited about 4 feet from surface.—B., San Francisco.

[The bud does not grow higher than set. It sometimes looks that way because the surface soil is shifted by wind, cultivation, irrigation or otherwise.

We should do just as you propose. Let those alone which have only sunk a little and re-set those which have sunk a good deal. If the soil is heavy, 2 or 2½ inches too deep would not matter. If the soil is sandy 3 or 4 inches would not hurt—if you leave it a little hollow around the tree. All deeper than this limit (according to the nature of the soil) we should re-set.

Of course it is not wise to plant over a recent blasting. Blasting should be done early, when the charge is so deeply set, and the ground settled before planting.—Eds.]

Colonel Weinstock addressed a meeting of 500 farmers and merchants at Turlock, last week, at which time he advised the growers to broaden their association of melon growers to include other melon growing districts of the State. It was brought out at the meeting that Turlock melons reached more markets last year than ever before.

Heavy foliage to resist sunburn. Strong, vigorous grower. Those who advertise it otherwise haven't it.

Thinks Standard Prunes All Right.

To the Editor: For the benefit of those of your readers who are in doubt regarding the "Standard" prune, and growers who judge it by the imperfect fruits from young and immature grafts, I wish to state a fact that seems to have been entirely overlooked by those who are knocking this new prune.

No fruit tree of several years' growth that has been cut back and grafted will produce a first-class fruit until the new top growth becomes fairly mature. The first crop will ripen late and when dried will shrink 25 to 40 per cent more than fruit produced a year or two later.

About the poorest lot of prunes I ever picked and dried, was a first crop of French prunes from grafts on peach trees of several years' growth. When grafting the trees I used scions cut from a tree that always yielded a fair crop of very large jet-black fruit that averaged around the 40 point when cured. The prunes from grafted trees were very light in color and weight and bore but slight resemblance to those from the original stock.

One of my neighbors has had three crops on his grafts and says "Standard is the only prune I'll plant in the future."

If picked when nicely colored but still hard, "Standard" will develop a flavor even finer than when allowed to ripen on the tree. This point will appeal to shippers of green fruit. Thousands of acres now being planted to other varieties will be grafted to "Standards" before they begin to bear fruit.

J. T. Green.

Morgan Hill.

AVOCADO VARIETIES.

[Written for Pacific Rural Press.]

The originator of Santa Barbara softshell walnuts is now testing out avocado varieties in Santa Barbara with the help of his daughter. He does not contemplate profit from his work other than the satisfaction of being useful in his youthful, genial old age. His name is Joseph Sexton, and his hope is to find the best few varieties for his district that will ripen fruit early, medium, and late so as to have fruit throughout the year. He says there are about 85 named varieties in the State, of which he has about 50. Below we give their observations concerning some of the better known varieties. These results may easily be very different in other parts of the State.

One of the first buds Mr. Sexton ever set was of the White variety, Sept. 10, 1911. In August, 1914, 7 ripe fruits were picked, the largest weighing 7½ ozs. The second crop was 100 fruits, largest 9 oz. The third crop ripened June 1915, 60 fruits, the largest 9½ oz. On June 28 he picked off 403 fruits of the fourth crop leaving 100 to ripen in Oct. and Nov. The tree bloomed in Oct. for the fifth crop of which the last were picked about Jan. 1, while there are now buds, blossoms, and small fruits developing. The flesh of the fruit has fine flavor but is stringy.

The Harmon has been shipped East and back again, but is subject to dry rot of the nose and the stone gets loose in its cavity. The flesh is thin and it cracks if it hangs on the tree long after it ripens.

Some of the Ganters crack on the tree after ripening, and have nose rot.

Nutmeg is a Hawaiian variety, the original tree of which Mr. Sexton saw while on the island. It has fine fruit, is growing well in January and the new growth has a very ornamental red color.

Blake is a small fruit of fine flavor analyzing about 28 per cent fat. At Pasadena it stood a temperature as low as 15 degrees F.

Taft has a desirable low-spreading growth of thrifty color and large trees, but has not fruited. Such growth is desirable to avoid wind which injures fruit. It is believed to be one of the best three varieties.

Blakeman and Maserve are the other two of the three best commercial varieties. Blakeman has larger fruit than Blake. Sharples is another good one. Cardinal has very ornamental new red growth in winter.

As a result of the agreement between the Central Water Users' Association and M. B. Moon, chairman of the bond holders of the Sacramento Valley Irrigation Project in Colusa and Glenn counties, greater activity in agricultural development is assured for the west side of the Sacramento valley this year than ever before. Large planting of alfalfa, fruit trees and rice which have been held up pending a settlement of this water controversy, now seem assured.

THE "BOSS" TREE PROTECTOR

Made of Yucca Palm. Is cheap, durable and quickly put on the tree. It prevents rabbits from destroying your trees. A sure protection against frosts, sunburn, grasshoppers, or dry winds. Can be easily removed, will last for years. Send for samples.

Lemon Lessons Gathered During 1915

[Address of C. T. Tengue before the Fruit Growers' Convention at San Bernardino.]

The year 1915 has gone down in history as the most disastrous in the history of the lemon business.

The California lemon crop was marketed at a loss of approximately thirty cents per packed box to the grower. The bad results obtained were due to several causes:

First: The reduction of the protective tariff from one and one-half cents per pound to one-half cent per pound permitted the importation of heavy supplies of foreign lemons during the spring and early summer months in the face of the largest California crop that the State had produced. Competition thus forced prices to a ruinously low level in the early spring and there followed the coldest summer all over the United States known in history. Heavy supplies of stored fruit, much of which was aged and in bad condition, was forced onto the market when there was little demand. The result was an almost completely demoralized market condition.

Postmortems are usually held, not for the benefit of the dead, but for the living. Adversity, tribulation and even death often result in benefit to the living. Let us hope that the lemon business will ,in the long run, benefit from the experiences of the past year.

Benefits Expected.—Some of the benefits that I shall hope for, are: An increase in the protective tariff on lemons. Surely it should be easy now to demonstrate that our industry should have a duty that will protect it against our markets being flooded with cheap, poor quality foreign lemons, produced by cheap labor, and shipped to our markets by cheap water transportation.

Second: The bad results of the past year will make the growers and packers scrutinize more carefully their cost sheets and endeavor in every way to get their costs down as low as possible, and, at the same time, increase the quality and quantity of their production.

Third: The excessive amount of decay reported in many cars on arrival in Eastern markets and the object lessons of how this decay affects values, will certainly cause growers and packers to bend every effort to seek the causes. Nothing affects good results in the lemon business so seriously as excessive decay, and the good or bad reputations of any brand, and its ability to command the highest market price in any market, depends largely on the record that that brand has made for good keeping quality.

To Supervise Packing.—Appreciating the importance of this, the California Fruit Growers' Exchange, through which is shipped eighty per cent of all of the lemons of the State, has permanently added to its forces a field man, or supervisor, of all of its lemon packing houses.

Mr. G. W. Hosford, one of the ablest and most experienced lemon men of the State, has been employed in this capacity and is making regular rounds of the Exchange houses studying the records of these houses, pointing out to the managers the weak places in their methods of picking, handling, grading and packing. To my mind this is one of the most important steps in advance taken by the Exchange within my knowledge. Hitherto the Exchange said to the local association: "We will take your fruit and market it to the best our ability, leaving it entirely to your judgment as to how that fruit shall be handled and packed." The result of this naturally was that good association management got good results and bad management bad results, and the figures gotten by bad association management were used to discredit the Exchange system of marketing by those interested in so doing. This Field Department will undoubtedly result in greatly improving the quality of the pack from the Exchange houses. Even this early, improvement is noticeable in the standardization of grades and in less decay by reason of better handling and by the proper classification of green, light green, and ripe fruit at the washing machines, which means that much of the ripe fruit which has been allowed to be packed under extra choice and choice brands at the expense of good keeping quality, will not, in the future, be packed under those brands, but will be packed under ripe brands and sold on its merits.

Brighter Future.—Out of all of the grief of the past year, therefore, has come better business methods on the part of the grower, packer and seller, which is resulting, and will result more and more as time goes on, in placing in the markets of America a better California lemon, which undoubtedly is the best lemon that the world produces when it is handled properly, and when this fact is generally recognized among the jobbers, retailers and consumers of the country, as it will speedily be through the Exchange system of national advertising, with a reasonable tariff, there should be no difficulty as the California crop increases of gradually forcing the foreign lemon out of American markets, resulting in an American-grown crop supplying an American market, which is as it should be.

Development in orchards in the Porterville section this spring promises to equal that of three years ago, up to that time the record-breaking year.

Great Apple Yield.

[Written for Pacific Rural Press.]

"They say you sold $2,000 worth of Rome Beauties from four acres; what was the main reason for such success?" we asked of A. A. Warren, who has many acres of apple and pear orchards on the flats of the canyon leading up to Oak Glen in Riverside county.

"Water is the main thing. Rome Beauties are thirsty trees; they need more water than any other variety we have here. I have my own intake and over 3,000 feet of pipe leading to the orchards, so I just water the trees whenever I get time. From early in July until the apples are picked in October, they are watered at least once every two weeks. That gives them color and size, which are the main market requirements.

"We got over 2500 boxes in 1914 from about 400 trees 11 years old. A heavy snowstorm the last of April, 1915, spoiled our crop last year. The first grade apples were sold to the wholesaler at $1.25 per box—the rest were sold as culls at about $20 per ton. The box apples had to be strictly fancy and 80 per cent full color.

"Pruning is important, to get the color; and we must spray in this country. We use 200 to 225 pounds pressure with a Bean Power Sprayer. Lime-sulphur cleans up the trees in winter and two arsenate of lead sprayings about 15 days apart usually keep the worms out. We combine iron sulphide or soluble sulphur to control powdery mildew which would affect Rome Beauties pretty badly."

Mr. Warren's neighbor, J. W. Crouch, with 25 acres including many Winesaps, had fine prospects for a crop of that variety last year in spite of the freeze, but lost most of them because of worms which infested them in August, though he had sprayed for them till June 1.

BLIGHT-FREE WALNUTS.

[Written for Pacific Rural Press.]

In the quest for blight-immune walnuts, A. L. Linquest of Goleta has come near success. On ordinarily level land, among 75 acres of 25-year Santa Barbara Softshells are about 12 acres of seedlings of a variety called Kaghazian, planted at the same time. So far as Mr. Linquest knows, there are few if any others in the State.

He claims eight tons of blight-free, tight-shelled, practically all white-meated nuts from the 12 acres, though some blighted nuts have been picked from under the trees. Some of them have been kept unbleached for two years and were then sweet, though slightly dried.

Ordinarily the variety does not bear so heavily as the Softshell, but the practical immunity from blight often brings the crop considerably above the latter. Very little if any blight has been observed on the twigs, leaves, or wood.

They bloom a month later than the Softshells, which may help account for freedom from blight, but they also ripen later—scarcely ever are they harvested before Nov. 15. Mr. Linquest thinks they might be earlier if irrigated.

The nuts vary as do all seedlings, but many are of the Eureka type, some are more pointed. They are often borne in clusters—as many as 15 have matured in one cluster. Trees bearing nuts of Mayette shape are now used for grafting wood to work onto black walnut stocks planted in spaces wherever other trees die.

ADVICE ABOUT TWIG BORERS

To the Editor: I would like to know if something has been found to paint or spray the scions after grafting so that twig borers or bud moths won't bother them?—E. A., San Jose.

[Nothing has been demonstrated to be effective. Arsenate of lead has been proposed as a poison likely to kill a bark biter and whale oil soap as likely to repel by its bad smell, but we are not aware that any one has reported positive results.—Editors.]

A $5000 canning plant is handling 80 tons of olives continuously for the Hemet-San Jacinto Growers' Association which was organized last September and started to build Nov. 20. J. A. Campbell, the veteran olive canner of the State, is in temporary charge of the plant.

THE ALPHA AUTOMATIC POWER SPRAYER

Fitted with
THE ALPHA AUTOMATIC PRESSURE GOVERNOR

ELIMINATES unnecessary wear and tear on both the engine and the pump.
THE PUMP STOPS when nozzles are closed. No liquid being pumped except it is forced through the nozzles.
NO RELIEF VALVE or diaphragm for the spray material to corrode and get out of order.
THE AUTOMATIC PRESSURE GOVERNOR is a simple arrangement of a combined lever and spring on each plunger connecting rod, which, when the pressure reaches a predetermined limit, automatically discontinues the operation of the pump without interrupting the driving power, again permitting it to resume operation when the pressure falls below the point at which it has been set.
THIS INSURES SAFETY, secures uniform pressure and eliminates unnecessary wear (no liquid pumped except it passes through the nozzles), the pressure relief is not dependent on the operation of a sluggish or defective relief valve, but is positive and mechanical, thus making it impossible to run the pressure up to the danger point.
BUILT IN ALL SIZES from a 2x3 inch pump and a 150-gallon tank to a 2½x3-inch pump and a 200-gallon tank. (Either Duplex or Triplex).

Peaches Need More Light.

To the Editor: I have 1000 9-year old Lovell peach trees that have never produced heavily enough to pay for care and first cost. Last year with one irrigation before harvest about July 20 the crop amounted to about 54 tons green.

These trees are planted 24 ft. on the equilateral triangle method—86 to the acre. The soil is for the most part rather sandy with good drainage. The trees have been topped each year, the object being to produce heavy, stiff branches and to cause the throwing out of fruit spurs in the lower part of the tree—this system having been successful on Muir and Elberta trees. The result however, has not been all that could be desired. The short spurs start in the spring and do well for a time, but the heavy growth in the top apparently shuts off light and air to such an extent that growth stops on the short spurs.

When winter pruning comes on, in order to get the tree in proper shape and down to a point where it would not break, the greater part of the fruit buds would be cut off. Would it be advisable to do little if any thinning in the tops of the trees? Would the opening up of the tree from the bending and breaking of the over-loaded limbs have a tendency to cause the fruit buds and spurs to form in the lower part of the tree?

The trees were irrigated in September directly after harvest for the purpose of giving strength to the fruit buds for the following year, but before the trees were dormant. No new growth followed irrigation. —W. G. F., Red Bluff.

[You have been giving your trees good rational treatment in irrigation, etc., but to get more fruit you must let them retain more bearing wood. If you did less cutting above, the top-load would probably swing open the tree and encourage new growth below as you suggest, but it would be more rational to open the canopy above by removing some of the central branches and give the trees more of an open-center. If you do that now and do not cut back the new top-growth so much, you will get more peaches both this year and in the future because the shoots which break below on the old wood will make a thrifty growth and set fruit buds for next year's bearing.—Eds.]

NEW DESIRABLE CAPRIFIG.

[Written for Pacific Rural Press.]

Seven generations of caprifig wasps in a year have been produced on the Pseudo carrica capri trees according to Francis Heiny of Brawley. This enables Imperial Valleyites to save the breba or winter crop of Smyrna figs. The hot weather develops and matures the wasps faster than in other districts. This combined with the fact that the Pseudo carrica capri fig fruits contain pollen in all of their crops and that they hold fruit all winter, brings the wasps out while the winter figs of the Smyrna are receptive. Mr. Heiny has one such capri tree with about 2,000 figs on it this mid-January, from which he expects wasps to emerge in February.

The variety was accidentally discovered by Mr. Heiny among some supposedly female fig trees which Dr. Francesci of Santa Barbara had imported from Italy and sold to him. The first crop on this tree dropped, and when the second crop of 15 figs was well set one October, Mr. Rixford saw them and later sent some wasps from the California Nurseries at Niles. The wasps infested the Pseudo carrica figs, multiplied, and have spread over the whole valley, where the fig is now one of the most promising fruits.

FROST INJURY TO GRAPE CANES.

To the Editor: I am sending you a cane of muscat grape. In the late fall or winter the bark cracks and dies back to the root, and ruins some of my vines. What is it and what can I do for it? The best thrifty vines are mostly affected. The soil is both sandy and heavy sandy loam. The vines are one and two years old and it works in spots. It is not the vines with black-knot which are affected.—J. S., Hardwick.

[Answered by Prof. Bioletti.]

[The vine cane shows the symptoms of injury by autumn frosts. Vines which are growing vigorously and which have not ripened their wood when the autumn frosts come are very liable to be killed back, sometimes to the arms and sometimes even to the ground. The remedy is to promote the drying out of the soil by ceasing cultivation sufficiently early to allow the vines to mature their wood before the frosts.]

GRAPES AT CUCAMONGA.

[Written for Pacific Rural Press.]

Wine grapes are very largely being interset with peaches, apricots, and walnuts, or being worked over to Sultanas in the Ontario-Cucamonga district. Time was when many Muscats were raised there for raisins, but oranges took their places. A few Muscats are left in that district, but their time of ripening (late Sept.) usually makes drying hazardous, especially because of the long time required on the trays or cloths on account of their size.

Thompsons are being tried but with little success, according to F. W. Whitney who has 16 acres of grapes between Ontario and Cucamonga, of which three acres are Thompsons and two of Muscats. He says Thompsons in that district have generally been pruned long and the canes twisted together in circles over the crowns as the Sultanas are trained. Whether from lack of sunlight or other causes, Thompsons seem to be shy, uncertain bearers here and not so prolific as Sultanas. Some will be trellised on wires next season as in the Fresno district, perhaps with better results.

The prevailing grape of the district in new plantings and graftings is the Sultana, on account of its good regular bearing, easy drying, and resistance to mildew.

-hardy citrus trees

Thrifty citrus stock—including Washington navel and Valencia oranges, lemon and grape-fruit. Prime, sturdy, two-year-old budded stock—caliper ¾ inch and up. Straight stems. Trees in perfect condition—grown in exposed positions. Best citrus stock that proper soil conditions and scientific culture can produce.

$2 Combination Offer

Four trees — Washington navel and Valencia oranges, lemon and grape-fruit $2.00. Additional trees 50 cents each. Single trees, 65 cents each. All trees carefully balled—perfect condition for planting. Write to or ask for Mr. Peck.

We have three citrus nurseries—Escondido, Anaheim and Los Angeles. If you are near these points we can save you money by shipping direct from nurseries. Take no chances with inferior trees — get healthy, robust stock. The Germain reputation for highest quality is back of every tree. Special prices on large shipments.

CHERRY TRAINING.

[Written for Pacific Rural Press.]

"In this valley everybody used to be afraid of pruning cherry trees on account of gumming, but we find that they do not gum so badly when cut in summer," says F. W. Duncombe of Beaumont.

But they must be formed while young, and Mr. Duncombe believes in selecting three limbs, as well as possible to avoid the basin which is so often formed in old cherry trees by growth of main limbs closing up to center so it holds rain, leaves, etc., to decay the trunk.

Two limbs are left at the second winter pruning on each of those left the year before; and a year later the number of framework limbs is again doubled as a general rule. Allow variations only to balance the tree, and save only the main limbs which will not crowd each other unduly when the tree is old.

No center limb is left, as the tree should be open. High color is one of the high points of Beaumont fruit; and it can be obtained best by a maximum of sunshine to the center of the tree. Where a moderate or large-sized center limb is cut out, it weakens the unions of the remaining limbs.

After the third winter pruning, only light topping back in summer is practiced. One limb, Mr. Duncombe pointed out had been cut back in 1914, had grown a long shoot last summer which was topped back and a new shoot had grown several inches. Practically every bud on the limb grew out ¼ to ½ inch long, and a number of fruit buds have developed just below last winter's cut. The light summer pruning stops endwise sap flow and forces it into the lateral buds, making them form strong fruit buds more abundantly.

A LANTERN WAX-HEATER.

The Placer County Farm Adviser prints in his monthly bulletin that a gallon of grade "D" asphaltum to which has been added one pound of rosin makes a good grafting wax. The rosin is added to prevent running during the hot weather. It is necessary only to heat the asphaltum to get it in the proper shape for application.

A. L. Teagarden of Mt. Vernon has an old lantern which he uses to melt the asphaltum. The globe is removed and a funnel-shaped cylinder put in its place. The lower end of the funnel fits over the wick and is of the same diameter as the bottom of the globe. The top end is about five inches in diameter and is open. A small can containing the asphaltum is set down in the funnel.

The pruning wounds of a large number of trees can be covered in a few hours with the aid of this heater. It could also be used to apply the mixture to grafts.

CREOLIN FOR CORN-EAR WORMS.

We have published a remedy found by Sam'l Haigh of San Jose effective against the corn-ear worm, by spraying the silk with creolin, one tablespoonful to a gallon of water. Mr. Haigh advises it only for garden use as he believes it would be too expensive to pay in field work.

Ridding the Farm of Weeds.

[Editor's Note.—This is the second of a series of five articles on weed eradication that have been prepared by Mr. O. W. Newman, Ass't Sec'y State Commission of Horticulture and which will appear in coming issues of this paper.]

ERADICATION OF WATER GRASS.

This weed infests low marshy places, frequently becoming a pest in alfalfa fields where the drainage is not good. It is not apt to be serious when the conditions for the alfalfa and the stand of alfalfa are good. In rice this grass has become a very serious pest. Chas. E. Chambliss says:

"During the past three years this grass has taken complete possession of more than 2,000 acres of rice land in Sacramento valley, and is now present in alarming quantities on a considerable acreage, which will soon be rendered unprofitable for rice growing unless active steps are taken for its complete eradication or control."

The seed germinates at the same time as the rice and the plants grow to maturity in about sixty-five days. If this first crop is allowed to go to seed a second crop will develop before the rice is ready to harvest.

Control: To prevent the further spread of this grass **sow clean seed.** It would be well if this could be an absolute command to the prospective rice planter. Have seed tested by the county horticultural commissioner or the farm adviser, and if it is not clean seed do not buy it, or have it cleaned until it will pass the test.

When water grass is present prevent it from going to seed if possible. Individual plants produce as many as 40,000 seeds.

Plow, harrow and irrigate land in the fall. This will tend to germinate weed seeds and leave the land clean for spring sowing. In bad cases crop rotation will be necessary, using, if possible, some hoe crop. Summer fallowing is also practiced with good results.

Ditch banks should be kept clean as well as levees in the field. For cleaning the banks a strong solution of sodium arsenite should be used, 4 pounds to 100 gallons of water. It is better to purchase this material already made up, if possible, as it is very poisonous and hard on the eyes and skin.

Screens should be placed in the headgates, using a very fine mesh screen for the inner gates. They should be cleaned very frequently, so as not to obstruct the flow of the water.

The following warning to rice growers has been issued to aid in checking the spread of water grass, by the Rice Committee of the Sacramento Development Ass'n:

Look our for water grass and other dangerous weed pests.

If your land is free of these, keep them out.

If your land is slightly infested, eradicate at once.

If your land is badly infested, take drastic measures with two purposes in view—first to prevent their spread, second to eradicate or control them.

Use clean seed—this is most important.

Use clean water—screen it if necessary.

Pull the grass out of your fields. Cut the roots below the crown with a spade or other sharp tool.

If too thick to pull, grow cultivated crops and cultivate well. A later bulletin will tell how to do this.

If your land is foul, don't plant rice this year. You will get a light crop and a low price and your weed problem will be worse next year. Clean your land and clean it now. This will be most economical. Urge your neighbor to clean his at the same time.

Remember rice is a profitable crop—the most profitable that can be grown on much of the rice lands—and that it will continue profitable only if these weeds are kept under control.

Water grass seed in your rice means a lower price for your crop.

Water grass seed on your land means no rice in the near future.

Don't underestimate the importance of the rice weed problem. The profits of the industry depend upon its being solved, and it must be solved right away.

Don't imagine you can kill these weeds by growing barley. You can't. To kill them after they are well set is a big job and will cost money.

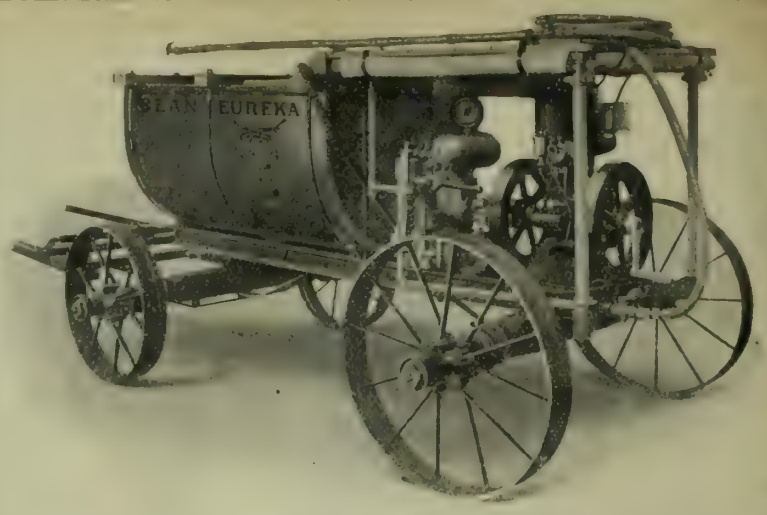
Don't be afraid to spend money when they first appear. This is the time to kill them, the time when eradication is easiest and cheapest.

Land owners leasing lands for rice culture should require lessees to keep fields, borders and ditches clear of these weeds. Put it in the lease and enforce it. Reserve the right to do it at the expense of the lessee—then do it at the right time if he does not.

Ditch companies should keep their ditches absolutely free of these weed pests. County roads must be kept clean.

The R. C. Merryman ranch of Exeter the past season averaged $1.96 f. o. b. packing house for their navels. This is the biggest year they have ever had. They sell through the Exchange, but pack on their own ranch.

KILMOL got him



One squirrel or gopher can do more damage for his size than anything on four legs. But Kilmol gets 'em every time—no uncertainty—a *sure* way at last.

KILMOL
SQUIRLGOPHENE

Will Kill 'Em All

Simply saturate a waste ball with Kilmol, put *one* ball in tunnel, ignite in from 3 to 5 minutes. The deadly gas does the rest—does it *quickly*—one treatment is enough. Results absolutely guaranteed or money refunded. Government, State and County officials use Kilmol. **Ask your local dealer** Write for information on squirrel and gopher eradication.

Col. Irish Prefers a Farm to a Bank.

"No accounting for tastes"—as the old lady said when she kissed the cow. He will probably get some hot shot on this statement.

To the Editor: Much trouble is caused by prejudice and by misunderstanding. We farmers, being brethren in distress, should tote fair and strive to understand each other.

Your correspondent, Mr. Doane, spots me as a politician, because I proposed a solution of rural credits by a simple amendment to the law, by which reserve banks would be authorized to receive long-time, 4-per-cent farm mortgages as security from the auxiliary banks. This would use banking machinery already in action, requiring no added cost nor salaries. Were I a politician I would join Mr. Doane in asking the creation of new machinery, commissions and salaries.

Mr. McClellan demands paternal government care of the farmer, because the National banks are paternal pets of the Government. He says: "I wonder how many people ever stop to think about the example of paternalism that we have in all our towns, even the smaller ones, in the shape of our National banks, who deposit interest-bearing bonds with the U. S. Treasury and draw down 90 per cent in National bank notes which they can loan to the farmer at as high a rate of interest as they can get."

Well, now, let us start a National bank, capital $25,000. The incorporators have to pay gold for $25,000 worth of U. S. 2-per-cent bonds, and get back, Mr. McClellan says, 90 per cent in bank notes, or $22,500. These banks are liable under the usury laws of the state in which they are located. Their average rate of interest is 6 per cent.

Now let us see what our bank is going to get out of it. At 2 per cent, its bonds bring it $500 interest. Its $22,500 in notes at 6 per cent bring it $1350, a total on its investment of $1850.

Out of that it must pay rent, insurance, taxes, and salaries of a president, cashier, and bookkeeper, the least office force with which it can do business. To me it does not look like a tempting snap. I would rather take my chances as a farmer, with $25,000 invested in land and improvements, with all the risk of flood, drought, bugs and fungus.

Our farmers need long loans, at as low interest as is compatible with good business. All this could be secured through the reserve banking system.

We need also less taxation, for that burden already amounts to more than 4 per cent on our gross income. The tax-eaters naturally want rural loan commissions, more salaries, more office-holders, more taxes to eat. They are able readily to divert the attention of farmers from the annual increase in taxes, by talking about loan commissions, and state paternalism, to produce cheap money.

Mr. McClellan regrets that there is opposition when it is proposed that "the Government shall loan money," at a reasonable rate of interest. But the Government has no money of its own, never had any money, and never will have any money. It taxes the people to get money, which belongs to the people and not to the Government.

Oakland. **John P. Irish.**

Pull Out Stumps
With the Famous Hercules!
Triple-Power

Pull an acre or more of stumps a day. Pull any stump in 5 minutes or less. Don't have loafer land when it's so easy and cheap to *pull the stumps out!* Make 1000% profit by using the Hercules. $1281.00 the *first year* on 40 acres! $750.00 every year after. Let us *prove* it.

Low Price and Book Free!

Get the facts. Read our book. Tells what all steel, triple power means. Shows many features of the Hercules. Shows many photos and letters from owners. Postal will do.

HERCULES MFG. COMPANY
112 24th St. Centerville, Iowa

WHAT CANNERS PAY FOR LABOR.

The wage board convened by the Industrial Welfare Commission of California has recommended minimum wage standards in the fruit and vegetable canning industry, which employs throughout the canning season some 10,000 women.

The wage board consisted of E. H. Kennedy, R. I. Bentley and A. G. Griffin, representing the employers; Isabel Schmitz, Erma Corey and Jennie Balistreri, representing the employes, and Katherine Philips Edson, of the Industrial Welfare Commission, who acted as chairman.

The wage board came to a unanimous agreement to recommend the following minimum rates:

	Per	Box of
Cutting	100 lbs.	40 lbs
Apricots	$0.225	$0.09
Pears	.375	.15
Peaches, cling	.225	.09
Peaches, free	.125	.05
Tomatoes, per 12 qts.		$0.03
Canning	Per dozen cans	
Fruit, No. 2½	$0.015	
Fruit, No. 10	.036	
Tomatoes, No. 2½	.01	
Tomatoes, No. 10	.024	

The new minimum rate on apricots will mean an increase of from 1 to 4 cents, per box of 40 pounds, to the women employed in 43 per cent of the canneries packing this fruit. Nearly one-fifth of the canneries packing free peaches will pay 1 cent more per box of 40 pounds, while 58 per cent of the cling peach canneries will put a wage increase in force. There will be increases in 36 per cent of the pear canneries, the same running from 1 to 3 cents per box. It must be stated, however, that a large number of factories heretofore have paid the newly established minimum.

An 800 per cent increase in the use of lemons for hair wash resulted in one ward from Exchange advertising in a local paper of an Illinois town last summer.

Not a "Mechanical Horse"

The first automobiles were spoken of as "horseless carriages." When they began to supplement horses instead of replace them—to do things impossible for horses to do—this term became obsolete.

The Yuba BALL TREAD tractor does the work of horses and it does things impossible for horses to do.

The orchardist uses it to pull tools that horses are unable to handle. He uses the Yuba to handle the heavy double disc cultivator—which at one operation does the work of the horse-drawn weed cutter, tooth harrow, the light single disc and the clod masher—and he gets close to the trees!

The grain farmer works his Yuba day and night, plows deeper, does his work when the land is in the right condition, and is less dependent on the weather.

Sandy roads or muddy fords are easily crossed by the freighter.

The Yuba BALL TREAD replaces 12 or 18 horses—does more and it achieves results impossible with horses. The catalogue tells why. Send for it.

THINGS TO KNOW ABOUT SUDAN GRASS.

[Written for Pacific Rural Press.]

Here are a list of questions and the answers to same about Sudan grass as compiled and sent to us by George C. Johnson, which will serve to enlighten many of our readers on this interesting new fodder crop.

How much seed to the acre when dry farmed? Ans.: two and a half pounds, sowed in rows with an Egyptian corn plate in the planter. How much seed to the acre on irrigated land? Ans.: five pounds drilled or sown broadcast. Will it grow more than one year? Ans.: No; it is an annual. Will it stand light frost? Ans.: Yes. Will it stand alkali? Ans.: Yes; it is harder to get a stand, but when started does not mind alkali, growing very rank. How long after seed is planted can it be cut? Ans.: In about 60 days, then every 30 days if irrigated. How much hay will it yield to the acre per season? Ans.: Ten tons or over on good land with water. What is its feeding value? Ans.: Moisture 4.46 per cent, ash 7.56 per cent, fat 1.53 per cent, carbohydrates 6.95 per cent, crude fiber 32.34 per cent, nitrogen free extract 47.17 per cent; Nutritive ratio, 1:7.3. Sudan grass has more than twice the feeding value of timothy hay per acre on account of the larger yield. Will it cross with other plants? Ans.: Yes, it will cross with all saccharine and non-saccharine sorghums, but its worst fault is that it will cross with Johnson grass and then becomes a pest to anyone getting such seed. Many acres have been ruined in this manner in Texas. Can it be put in silo? Ans.: Yes, alone or mixed with alfalfa makes a better balance.

The Southern Pacific Co. has announced a reduction of 25 cents a hundred pounds on nursery and florists' stock from California points to the East.

CALIFORNIA'S ETTERSBURG STRAWBERRY.

(Continued from page 281.)

to three times, but if you will spell it backward, you will readily agree with me that it has a much closer relation to conceit.

Trebla is that wonderful evergreen and everbearing strawberry that in its initial test produced at the rate of three quarts of husked berries to each and every plant, or at the rate of 25,000 quarts per acre. Knowing the conditions under which this record was made, in fairness to it, I feel that I am not over-estimating its ability when I say it is capable of yielding 40,000 quarts or twenty tons of berries per acre. More than this, it is a variety so distinct that it is a radical breaking away in strawberry forms with striking possibilities for the plant breeder.

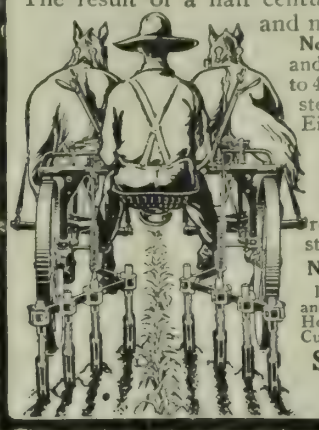
Being a Good Stumbler.—When you look back over the ancestry of Trebla, and note the general worthless character of its ancestors, you want to call this man Etter a genius to so twist Nature to give up a progressive secret to the horticultural world. But remember what I said about shallow-pated, would-be geniuses, groping around with a poor light, seeking in dark places what is laying in the open before them. Truly, I went through some dark and unusual ways to get an evergreen and everbearing strawberry and thus crystallize my predictions. But while I was thus engaged, I crossed Chesapeake with No. 20 and produced a more thorough everbearing variety, but not with all the other qualities of Trebla.

The moral to this story is: It is better to be a good stumbler into something good than to be a real genius always trying to find a way to "break in" and never getting anywhere.

Some Good Stumbling Blocks.—To continue the story, if you would like to know what I have stumbled into, I will say it seems to me that I had stumbled into everything. When I say everything I am speaking with inside information, with a knowledge of much I have not disclosed to the world. Again, I am such a poor prophet that to protect myself, no matter what turns up, I can say: "I knew it was coming." Some of this, as one may gather from my story, is so close to the surface that it is in the reach of anyone who is willing to grow a few seedlings. By this, of course, I mean if he strikes a lucky number. Again, the roundabout, crooked, unreasonable, idiotic plays one can make in combination, and still get surprising results, makes one wonder where it will eventually wind up. It literally means that one does not need very much brains if only he be persistent in crossing. And if I may offer a real tip to the beginner, look back over the ancestry of Trebla, dismiss your reason, and go ahead full speed.

How to Cross Strawberries.—In hybridizing strawberry blossoms, the process is simplicity itself. You may need a penknife, but not necessarily You will need a piece of tissue paper two or three inches square which is used as a hood to hold the male blossom in place over the newly opened female blossom. The stem of the plucked male blossom is inserted in a hole through the center of the tissue paper, the blossom placed over the female blossom. Now fold the paper back and tie with a small piece of cord. This is all there is to it for practice work. As the male blossom withers, the pollen sacks burst and the dust is brought into contact with the pistils. By using a pistillate female parent, all that is necessary is to plant side by side with a prospective male parent, and insects will do the rest. This, of course, is not scientific; but it is practical.

Observation of New Varieties.—As time goes on, I am continually learning something new about these hybrid strawberries. Those who write and tell me their experience in the cultivation of them make it possible for me to give this information to the public. Whether good or bad, it is all acceptable. Various correspondents corroborate my admonishment about putting these hardy, half-wild plants in too rich ground where they all go to foliage. Some are unwilling to wait until the second season for berries. In several cases where too good treatment failed to give results worth while, neglect of the beds gave a big crop the following season. Where they have been put on moderately fertile to poor land, good results have been the rule. On moist, rich land leaf-spot is always worse, No. 121 being particularly susceptible to it. Several of my newer varieties are almost, if not quite, immune to leaf-spot. As regards hardiness against colds, they seem as able to resist cold as are the ordinary varieties.



What Cultivation May Do.—We must live and learn, as the saying is, but sometimes our desire to get results by careful methods stands between us and our knowledge. For years I believed that reasonably good cultivation would give best results. Now, I am forced to believe that with varieties such as No. 80, 84, 89, 112, and 121, where the plants run wild and cover the ground, we get more and better berries than where we have been in the habit of giving spring cultivation. Where the plants had not been disturbed for three years, having taken possession of the ground, there was a perfect carpet of berries. They were of fine size, perfectly free from dirt, better color, flavor, and general quality than from cultivated plants. Stranger still was the behavior of those uncultivated plants when we had a three days' spell of 100 degrees in the shade. The cultivated plants of the same varieties suffered severely, while the uncultivated ones suffered not at all. In this case I will say no irrigation was practiced. All this is very significant because it means that these new varieties are so hardy that here, where originated, they will grow wild where the regular varieties will not succeed even with good cultivation.

Hardy Against Rain and Frost.—But this is not their only adaptation to our needs. A man writing from Turlock says that No. 80 will stand with very little injury rains that

Planet Jr. Cultivators

have no equal anywhere

They produce the best crops and biggest profits wherever used. The result of a half century's experience of a practical farmer and manufacturer. Fully guaranteed.

No. 76 Planet Jr Riding Cultivator plows, hills and cultivates corn, potatoes or similar crops 28 to 48 inches apart. Specially hardened cultivator steels. Pin-break or spring-trip standards. Eight styles—*lower prices than ever before.*

No. 8 Planet Jr Horse Hoe and Cultivator is stronger, better-made and capable of a greater variety of work than any other horse hoe made. Non-clogging steel wheel. Depth-regulator and extra-long frame make it run steady. Adjustable for both depth and width.

New 72-page Catalog (184 illustrations) **free!**

Describes over 70 tools including 12 entirely new ones, and improvements to our Seeders, Wheel Hoes, Harrows, Horse Hoes, Orchard-, Beet- and Pivot-Wheel Riding-Cultivators. **Write postal for it today!**

P. & O. No. 40 Combined Corn and Bean Planter

Furnished with open center or solid concave tires.

The Combined Corn and Bean Planter here illustrated is a machine built by one of the largest manufacturers of planters in the world, particularly to meet the requirements of the Pacific Coast trade.

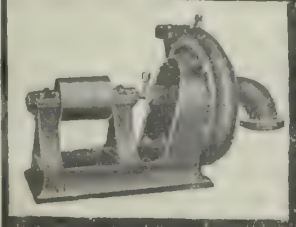
It is not a made-over machine but is built from the ground up for Coast needs. This fact, together with the reputation of the P. & O. Company for building tools right in every detail, insures absolute satisfaction to every user of this planter.

It's the Way They are Built

FEATURES:

Equipped with a full set of plates for planting any of the different kinds of corn or beans commonly planted in California, including Egyptian and Kaffir corn.

Adjustable to any width rows from 28 to 44 inch. The check rower machine is adjustable for checking rows 3 ft. 4 in., 3 ft. 6 in., and 3 ft. 8 in.



Accurate planting insured by the sight feed. Sight feed has a large opening, and the seed is visible at all times to the operator as it drops from the hopper to the upper valve.

Quick, detachable runners held on the shank by one bolt. Easily removed for sharpening.

Write for descriptive circular and address of nearest agent.

will ruin ordinary varieties while ripening. From New Meadows, Idaho, I have it that during the blossoming season, Ettersburg strawberries will stand rain, hail, and frost and still make a crop where ordinary varieties were ruined. My observations on No. 89 in particular, are that it will stand frosts without injury while in blossom that actually destroyed a large percentage of the blossoms on some of the other varieties. This hardiness of blossom alone is a mighty big factor in the strawberry world.

In Hot Valleys.—Rose Ettersburg has proved to be well adapted to the San Joaquin Valley. It is a variety that requires considerable heat to develop its best quality. From the hot valleys in Arizona, good reports come from Ettersburg No. 80, where it is superseding the Arizona Everbearing as a better berry in several respects. The Arizona Everbearing is a one-crop berry here just like No. 80. It is large, but rather soft and of low flavor. This variety and the Minneola are both of Chiloensis stock, and of all the hundred or so of regular varieties I have here, they are the only two I would so consider. The foliage, blossoms, runners, and fruit all show the Chiloensis type.

The New York Agricultural Experiment Station, at Geneva, reports success with No. 80, 84, 89, and 112. Maryland says No. 80 is good. Good reports also come from Michigan. As soon as eastern growers appreciate the fact that their hybrid buck strawberries will grow on land too poor to grow ordinary varieties, it is highly probable that they will become popular because they will overcome some of their most trying places.

Shipping Characters. — The shipping qualities of such varieties as No. 80, 89, and 121, and of some of the newer varieties, are remarkable. I have shipped them from Ettersburg to Eureka, a distance of 82 miles, over rough mountain roads 64 miles, and they arrived in perfect condition. They were neither carefully picked or packed in special containers, or transported in light springed wagons. They were carelessly picked, even to overripe berries, packed in 5 to 7 pound boxes, 4 to 6 inches deep, and for over half the distance were hauled on what was practically a dead-axle wagon, the vehicle being a large platform spring wagon without a ballast. Some of these berries thus hauled 34 miles were kept in good condition for four days after arrival.

Credit must be given to the extra shipping quality of berries grown here without irrigation, but we must not forget that a berry of solid structure, of such specific gravity that it will almost sink in water, must in the very nature of things have merit peculiar to its class. Again we must give credit that a berry, such as these beach hybrids, having just about double the days of life in condition after they become red, must be of special merit as shipping stock.

It has been laid down by certain authorities that a shipping strawberry must have prominent seeds to protect its surface from abrasion when packed. However true this may be with ordinary varieties, my opinion is that it will not hold good with what is now in existence among my hybrids. Most varieties of strawberries have very delicate and fragile skins that are exceedingly easily broken. Then I have noticed among some hybrids that even though they may have sunken seeds, they will stand an amount of banging around and scarcely bleed, that would put the ordinary variety into a shapeless mass.

Will There be a Crisp Strawberry?—A variety may have fruit that is soft and loosely constructed, or it may be soft, but filled to the brim with juice. In either case, the juice of the berry is held in cells, and it is the toughness of these cell coverings that makes the berry resist handling. Some of the ordinary sorts have much fiber that naturally strengthens the framework of the berry. Varieties like No. 80, 89 and 121 have practically no open core as is characteristic of the ordinary varieties, but what might aptly be termed a cling core analogous to a cling peach. Like a cling peach, as compared to a freestone, they also have some fiber, but the whole structure is more meaty and filled in solid. A fruit of this type, with tough cell skins (if I may be allowed to use such a term), has every advantage in the way of a fruit to stand handling.

It is the lack of fiber, and the thoroughly filled and closely compacted cells, full of juice, that makes the crisp apple. I believe that we shall attain the same thing in a very marked degree in strawberries. I don't predict this as a prophet, or guess at it trying to be a prophet, but I have seen enough to believe that a crisp strawberry is attainable.

[To be concluded next week.]

John Deere Plows for Light Tractors

For Orchard and Vineyard

Practical—work with any standard tractor. One-man outfits—controlled by man on the tractor.

No levers—one reason why these plows work so successfully. Plows leveled and depth regulated by screw device. Can be run close to trees and vines without injuring branches.

High and Level Lift—Pull the rope and all bottoms raise high and level. Another pull lets them down.

Plows raised in fourteen inches ground travel. Make square headlands.

All bottoms raise high like a double bail, high lift horse plow. You know from experience what this means. Plows do not clog or gather trash on the turn.

Extra wide and semi-floating front truck.

Equipped with either three or four famous John Deere 12-inch bottoms with Quick Detachable Shares—the shares that can be taken off and put on in one-fifth the time it takes to change bolted shares.

Write us for free booklets telling all about John Deere Light Tractor Plows for orchard and vineyard work, or Light Tractor Plows for regular field work—the plows with Quick Detachable Shares, high and level lift.

John Deere Disc Plows for Tractors

For Field or Orchard

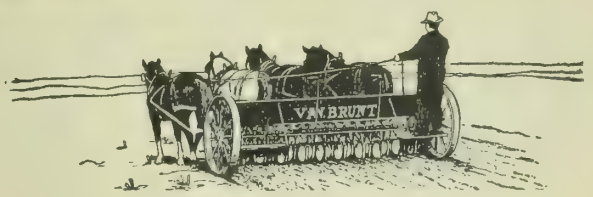
MADE especially for use in the West. Work successfully in every soil where a disc plow should be used.

Plow anywhere from five to twelve inches deep.

One-man outfits—controlled by man on the tractor. Work with any standard tractor.

Can be used either for field or orchard work simply by changing the land axle.

All levers down close to plow when at work—plow can be operated close to trees and under limbs without injuring them.



Easily transported—special lever at the rear for lifting discs high and level.

Over fifteen inches clearance under beam; twenty inches between discs.

Twenty-four or twenty-six-inch discs with chilled metal bearings—constructed so that bearings do not drag along wall of furrow when plowing deep.

Can be reduced to four discs by taking off one intermediate section and telescoping connecting rods.

Write for free booklets describing the John Deere Tractor Disc Plow No. 10 for field work and No. 11 for orchard and vineyard.

Van Brunt Drills

With Adjustable Gate Force Feed

THEY plant any small seed, alfalfa to bearded oats, peas or beans. Quantity per acre easily regulated merely by shifting feed gauge levers.

All the ground planted without wasting seed. The Van Brunt adjustable gate force feed and special agitator in the hopper compel seed to leave hopper in even, continuous streams.

An even stand of grain is certain. Pressure springs compel discs to make furrows of equal depth and seed is protected until it reaches bottom of furrow. Single or double discs. Write for free booklets.

John Deere Syracuse Plows

The Plows with Perfect Fitting Parts

SYRACUSE chilled shares fit perfectly—extra shares go on easily. Share draws up snugly to its place—a smooth joint formed always.

Syracuse 601 Series, wood beam, sloping landside plows are superior for general purpose work in light soils—the 16 Series, wood beam, with side shifting clevis, for hillside work.

Syracuse J-gang plows, three bottoms, are especially satisfactory for vineyard and orchard work.

Write for free booklets. Also ask about Syracuse non-cloggable spring tooth harrows.

R. & V. Engines

Dependable Farm Power

"R & V" Triumph—always develops rated horse power—made in 1, 1½, 2½, 4, 6, 8, 10, 12, 16 and 20 H. P. sizes, stationary and portable.

Easily started; perfect speed control (speed can be varied 40 per cent without stopping engine). Complies with insurance regulations. Hopper cooled—a simple, efficient system that does not require long pipes and numerous fittings.

High grade throughout. Inspect the extra guard ring over piston pin to prevent possibility of scoring cylinder. Ask about the "R & V" oscillating magneto. Write for free booklet.

John Deere Dealers Everywhere

Better Farm Implements and How to Use Them

BOOK FREE—168 page reference book—tells all about a complete line of farm implements and how to adjust and use many of them. A practical encyclopedia of farm implements. Worth dollars. Describes and illustrates: Plows for Light Tractors; Steel and Chilled Walking and Riding Plows; Disc Plows; Cultivators; Spring Tooth and Spike Tooth Harrows; Lister Plows and Cultivators; Disc Harrows; Alfalfa and Beet Tools; Farm and Mountain Wagons; Teaming Gears; Manure Spreaders; Inside Cup and Portable Grain Elevators; Corn Shellers; Hay Loaders, Stackers, Sweep Rakes, Mowers, Self-Dump Sulky and Side Delivery Rakes; Hay Presses; Kaffir Headers; Grain Drills and Seeders; Grain Binders; Corn Binders; Gasoline Engines. This book sent free to every one who states what special implements he is interested in and asks for Package No. X-152.

John Deere, Moline, Illinois

General Agricultural Review.

CITRUS AND SEMI-TROPICAL.

The Corona Lemon Co. has been taking out its frost pots emptying them in a specially economical way.

Co-operative citrus distribution to the jobbers last year cost 1.2 per cent of the gross sales. The year before, the cost was 1.4 per cent.

Over 50,000 grapefruit trees were planted in Imperial county last year, according to horticultural commissioner F. W. Waite.

A 10-year grapefruit tree about 10 feet tall was washed out on Harry Cook's orchard near Redlands. One of its big roots was over 15 feet long.

The California Fruit Growers' Exchange sells to about 3,000 jobbers who sell to about 300,000 retailers who sell to nearly 100,000,000 people.

The National Orange Co. is irrigating several hundred acres of oranges on steep soil with surface irrigation pipe discharging into basins between the trees.

No orange in the world equals the Valencia Late in keeping quality on or off the tree and in seducing money out of the other fellow's pocket, according to C. C. Chapman of Fullerton.

Two cars of oranges were shipped last week to Salina, Kansas, by Bishop and Merryfield of High Grove. Orders were received and prices named by wire while the fruit was still on the trees.

The newly organized Strathmore Fruit Growers' Association elected the following officers: T. H. Radley, president; S. A. Warson, vice-president; J. Leon Linden, secretary; A. W. Shaw, Chas. F. Stegemeier, L. A. Jones, and Geo. G. Cole, directors. This new association will market through the Tulare County Citrus Fruit Exchange, handling about 100 cars next season.

The following committee has been named by State Market Director Harris Weinstock, to confer with the State officials on a system of State control of the citrus output: W. E. Sproutt, Sec'y and Manager of the Tulare County Citrus Fruit Exchange; P. F. Goswell, El Monte; A. Gregory, Redlands; C. C. Chapman, Fullerton; C. C. Teague, Santa Paula, E. M. Lyon, Redlands; P. J. Dreher, Pomona.

GRAIN AND FIELD CROPS.

E. E. Bush of Corcoran contemplates planting about 600 acres to rice on his land there.

Large shipments of flour and wheat from the Middle West to California are reported.

H. W. and W. E. Meek Co. shipped the first asparagus from Antioch on Feb. 23.

Green pea shipments by the carload are said to have commenced from Brawley.

About four carloads of lettuce are ready for shipment from Heber, Imperial county. Part of this will be shipped East.

The acreage sown to grain and alfalfa in the Livingston district this year is reported to be considerably larger than usual.

It is estimated that there are over 8000 acres of land seeded to sugar beets in the Visalia district this season, which is over 1000 acres more than last year.

It is expected that the crop of new potatoes in the lowland districts will be very late this year on account of excessive moisture in the ground preventing planting.

Three hundred bales of Mendocino hops belonging to J. A. Ford, Kirk Ford, and J. Wooley were purchased last week by Geo. Proctor, Santa Rosa hop dealer, at 12 cents.

The Irvine Ranch in Orange county will have 2,300 acres of lima beans again next year. Perhaps because they are not irrigated, the yield on this ranch is only 10 sacks per acre.

The sugar beet factory at Corcoran, which has not been in operation for several years, will open this season. The new management will endeavor to contract for 50,000 acres of beets.

Milton Wasserman, who is an extensive hop grower of Sonoma county, is planting prunes between the hop rows on 50 acres of his land. He expects within the next three or four years to grub the hops out.

The February report of the International Institute of Agriculture made up from data supplied by each country, shows that war needs have increased the crop area of the world 7 3-10 per cent.

H. K. Wiley, alfalfa seed expert of Springfield, Idaho, recently visited the Orland project with a view to investigating conditions there for the purpose of raising alfalfa seed for market.

The Rice Growers' Association of Yolo county held their second meeting on Feb. 26, with G. H. Hecke as chief speaker of the day. One of the purposes of this association will be to get lower freight rates for this year's crop.

State Market Director Harris Weinstock has called a meeting of all delta farmers to be held at the Palace Hotel, San Francisco, on March 9, for the purpose of discussing ways and means of standardizing and marketing delta products, especially vegetables.

Ernest Rapp of the Laramie Broom Corn Co. of Ogden, Utah, was recently in the Imperial Valley investigating the possibilities of raising broom corn in the Valley. He declared that the facilities there for growing that product were of the best.

At the close of the Exposition the Sperry Flour Co. of Stockton purchased 26 lots of wheat placed on exhibition by Australia and New Zealand and planted them on a 25-acre tract near Stockton. Before doing so they were tested in the Sperry Flour laboratory to determine their worth in making flour.

The Sherman Institute Ranch under Supt. J. R. McClellan of Arlington nearly filled two silos of 90-tons capacity each from 20 acres of Indian corn last year. He expects to fill the silos next season from considerably less than 20 acres of King Phillip flint corn, seed of which is already secured.

The San Joaquin Fruit Co. of Orange county has used 1400 tons of lima straw in the past two years as mulch on 60 acres of oranges and lemons. They will apply 1000 tons next year on other acres at the rate of 5 to 8 tons and will continue the practice till their 400 acres are so treated, then repeat every three years.

DECIDUOUS FRUITS.

It is reported that more young fruit trees are being planted around the Chico district this spring than ever before.

Apricot prices are pretty sure to be higher next season than they were last, according to Manager W. S. Mudd of the Hemet Canning Co.

Hemet apricots were in full bloom Feb. 22. They indicate the lightest crop in years, according to president E. O. Eggen of the Hemet Cured Fruit Association.

"We will certainly summer prune our apricots hereafter," say A. E. Goodrich and Son of Hemet who have been experimenting on a large scale for several years.

Efforts are being made to combine into a Southern California organization the Cured Fruit Associations of Ventura, Santa Ana, Hemet, Banning, and Elsinore.

Hemet Cured Fruit Association sales this year totaled about $80,000 according to Manager C. G. Hamilton. The last 90 tons of apricots have just been shipped out on one order.

A meeting of the Reedley peach growers was held last week in the interest in the newly organized Cali-

Cuts Operating Costs

THE Rumely OilPull has firmly established itself on the Coast and has successfully met Coast conditions. It is a cost cutter from the start, burning "Stove Tops" and the cheapest distillates *at all loads, under all conditions—all the time.*

As one Coast owner writes in, "We have three different tractors and find your Rumely by far the cheapest to operate. This is due to your ideal system of building a tractor, and your carburetor which handles low gravity, cheap oil."

Then, the strong construction of the OilPull, and the high quality throughout, naturally cut down upkeep expenses.

Notice that on the OilPull the air intake on the carburetor extends high up out of the dust. The oiling facilities are particularly efficient and all working parts are well protected.

Oil cooling is another advantage—no bother with cooling water and no danger of radiator freezing.

As a threshing engine and for all belt work the OilPull is as efficient as on the draw-bar. It is throttle governed—there is no fuel waste and the power is steady and uniform. The temperature of the engine is so regulated that it will run equally well on full load, light load or on no load There is, of course, absolute freedom from sparks.

You will find that the OilPull will handle all your power jobs, draw-bar or belt, and save money at each operation. Two sizes, 15-30 and 30-60 horsepower.

Ask our nearest branch for an OilPull catalog?

Advance-Rumely lines include Rumely traction plows, the light weight GasPull tractor and the new All Purpose small farm tractor, threshers, steam engines, hullers and huskers—all dependable machines and backed by Advance-Rumely service.

fornia Peach Growers' Association. About $1320 in stock subscriptions was secured.

The Hemet-San Jacinto Growers' Association expects to begin the erection of a $40,000 cannery in March to handle olives, honey, peaches, apricots, etc. Their present temporary plant will be dismantled.

The Ehmann Olive Co. is planning to set out 24,000 fruit trees on 200 acres in Happy Valley, Shasta county. Six thousand olive trees will be planted with rows of peaches and plums between them.

Growers of the Northwest recently organized the Fruit Growers' Agency with headquarters at Spokane, Wash. This organization plan is built upon a uniform contract in which the grower is permitted to set the price for which his fruit may be sold.

Fowler peach men met last week and were addressed by Pres. Glass, Vice-President Niswander, and Fred Nelson. Every man at the meeting had taken stock before at the rate of $20 an acre and one man subscribed as high as $100 an acre. Additional subscriptions received amounted to $1610.

Peach growers of the Sanger district held a meeting on Feb. 24, at which Pres. W. Glass and Manager Sunderland spoke for the Association. Most of the farmers attending this meeting had already signed up and subscribed for stock also, but at the close of the meeting $1000 more had been added to the fund.

Kenneth McKay, manager of the Hood River Fruit Growers' Exchange, Hood River, Ore., was a recent visitor in Watsonville and while there urged that the Watsonville Apple Distributors affiliate themselves with the Northwest Fruit Growers' Exchange, pointing out the many advantages of such a union.

The newly-organized Apple Growers Auxiliary of the Humboldt County Farm Bureau recently met and elected a Board of Directors consisting of: M. F. Gardner of Petrolia; Jas. Hubbard of Shiveley; Geo. Wrigley of Elk Grove and Pres. Geo. W. Cummings of Shiveley and Secretary Robt. L. Werner. Growers from Arcata, Bayside, Shiveley, Mattole, Rohnerville, and Elk River have signed up.

OLIVES AND NUTS.

M. L. Requa of Oakland is planting 200 acres to almonds in the Loam Ridge tract near Orland.

Orange Cove olive growers have started the movement for the formation of a local olive growers' association and the erection of a local pickling plant.

The Tulare cannery will continue operations for some time longer, having on hand 60 tons of olives yet to be packed. The pack so far has been 1300 boxes or about 26 tons.

J. H. Wheeler of Napa county has been advised by Exposition authorities that the jury of awards had given him one of the highest medals of honor for the walnuts he exhibited.

Three almond trees three years old and six inches in diameter, having been planted as two-year stock, bore three pounds of nuts each last year on the Devore ranch in San Bernardino county.

Olive growers of the Wyandotte section of Butte county met recently and organized the Wyandotte Olive Growers' Association. Over 50 per cent of the acreage in olives joined the association at the first meeting and it is believed that practically the whole acreage will join.

MISCELLANEOUS.

A National Farmers' Association designed to bring together all farmers in the United States was formed at Kansas City on Feb. 22.

March 6 is the date tentatively set for the organization meeting to be held in Humboldt county for the purpose of giving Eureka a farm center.

The Southern Pacific bought the California Development Co. for $3,875,000 to turn over to the people of Imperial Irrigation District, taking District bonds in payment.

Since the Imperial Valley levee showed its strength, Los Angeles financiers have been offering money on farm loans there at 7 per cent interest, lower than ever before.

Shade trees will be planted along the State Highway from Bakersfield to Tejon for a distance of 19 miles in an effort to make that one of the most attractive shaded boulevards in California.

The annual meeting of the Riverside County Beekeepers was held recently, electing the following officers: B. L. Powell, president; W. C. Hoare, vice-president; R. J. Brown, secretary and treasurer.

The establishment of a Contra Costa farmers' market in Oakland is under consideration by the growers of that county, who desire to try their hand at marketing their produce without the aid of middlemen.

The California Nursery at Niles has presented the city of Oakland with an exact duplicate of the 100 species of conifers, or cone-bearing trees, which were planted in front of the Hoo Hoo building at the Exposition.

The warm weather of last week has made a crust on top of the ground and the farmers in some sections of Fresno county are rushing their cultivating. The ground is not dry by any means, but this crust on top is not good. C. R. Stockdale is not worrying a bit. He takes his rotating harrow and harrows all his land before starting to plow, leaving the surface of his soil nicely pulverized, preventing it from cracking, and drying out; also giving him more time for plowing. The soil is in better condition when he is finished because none of it is plowed too early and none too late.

The Salof Self-Setting Gopher Trap.

Only trap having free passage Will entirely rid your place of gophers in one season. Will catch all sizes. If you want a trap that will give results, try this one. If your dealer can't supply you, will be sent postpaid for 50c; 3 traps, $1.00. Circular free. A. SALOF & CO., 3914C 39th Ave., Oakland, Cal.

CHUBBUCK'S IDEAL GOPHER TRAP

Larger than runway; jaws pull rodent in; catches large or small gopher and holds it. Farmers say it's worth dozen other makes. Big sales. **Price 50c.** If not at your dealer's will send it to you postpaid; 2 for 95c; 6 for $2.70; 12 for $5.10. Money back if you are not satisfied. Free circulars. E. J. Chubbuck Co., Dept. B San Francisco, Cal.

As your mileage mounts higher and higher—7,000, 8,000, 10,000 and even 20,000 miles in many cases—you will more fully appreciate our slogan, "No load too Savage for Savage Tires."

And Savage tires cost less than most of the so-called standard makes. You buy them direct from factory through employed distributors. The middleman's usual profit is saved, and we give it to you in higher quality—extra miles. Adjustments are made on the basis of 4,500 miles.

It is easy to obtain Savage Tires. You can buy them of distributors near you or mail your order to our nearest sales branch. Either way the price is the same.

Ask for the address of your Distributor and for our interesting Tire Book No. 1318. It describes Savage Tires and Grafinite Tubes and explains our money-saving sales plan.

Mechanical Power on the Farm.

GAS ENGINE IGNITION.

[Written for Pacific Rural Press by W. H. Sanders, Yuba City.]

In recent issues many of your subscribers have discussed starting a gas engine without the aid of batteries, or direct from the magneto.

Now this is a common practice with most standard engines put out now days if purchaser so desires, and is done by using a high tension magneto, many makes of which give a spark at only a half turn, and there is no need of spinning the engine or turning it over several times as your subscriber from Palermo does, and these high tension magnetos are usually geared to crankshaft and thus avoid all friction or belt-drive troubles. This latter relates to one-cylinder engines.

Should your subscribers now using batteries desire to convert their engines to a batteryless engine they could do so by getting any of the standard high-tension magnetos installed. Say, for instance, the Bosch high-tension magneto could be installed on any common one-cylinder engine or engines with more than one cylinder.

If the make and break spark is used it would be necessary to change the jump spark, and the make and break device taken off, which would be done by your dealer if he is thoroughly acquainted with his business.

If the jump spark is in use the change should not take long.

This does not relate to small engines which can be spun or turned over several times with ease, but relates to any size in common use, as a half-turn of the fly-wheel will give a spark sufficient to start without difficulty.

This change would in common cases cost downwards of $50 according to magneto selected.

Where dry batteries are used, and engines are in use a long period of time without stopping, it is advisable to use a double set of batteries and a double switch, thus using one set for an hour and switching over to the other set, as resting will often recuperate a set of batteries so they will be much stronger and last longer. This would not be advisable where a low-tension magneto is used as the batteries are only used to start from.

In buying batteries be careful and do not accept any with a broken face or any that have been sweating, or in other words, such as have an appearance of salt on them, also do not keep the battery tester on the tying posts of a cell or battery longer than is necessary to find out its strength, as it will have a tendency in some cases to cause a short circuit and be harmful to the battery.

It is also a very good practice to keep all terminals clean from rust and grease, and keep the ends of insulated wires scraped clean. This can be done when changes are made from old batteries to new ones.

Above all things keep the batteries dry. With a low tension magneto where the batteries are only used to start from, a set of batteries will last a long time, but the service might not be as satisfactory as with the high tension magneto, as the batteries will have to be used to start from, and without them a low-tension magneto would be practically useless unless you had a very small engine which could be spun at a very rapid rate of speed, say possible 200 r. p. m.

The batteries with a low tension magneto will gradually get weak, just the same as a set left on a shelf in a hardware store or anywhere else for a long time, as there is a mechanical action going on in the dry cell to some extent even if not in use, though not to any great extent; it always has a tendency to weaken more or less.

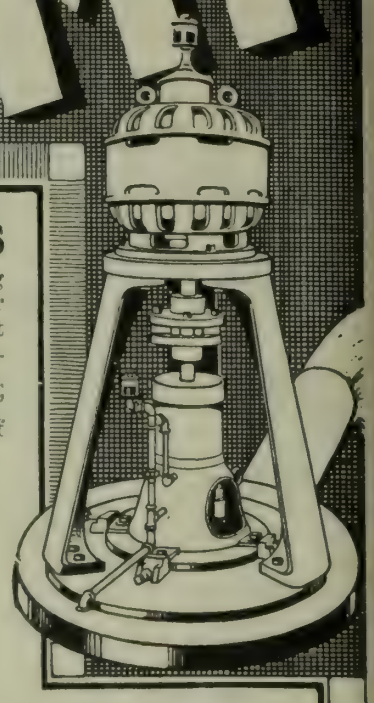
MATERIAL SCARCE—TOOLS HIGH.

"On account of the war" is becoming a tiresome answer to those consumers who are almost daily asking why the price of this or that has been so materially increased in the past year and a half. That the buyer of farm machinery will also face a general increase in price for his implements seems certain from the following extracts of a letter received by a California implement manufacturer from the East, who has to buy large quantities of raw material:

"The price on steel bars, plates, pig iron and sheets have now advanced to prices averaging 50 per cent greater than they were in June, 1915. Proportionate increases are also in effect on such items as soft center and solid steel for cultivator shovels, plows, harrow discs, malleable castings, bolts, springs, etc. Lumber of all kinds has advanced and paint has practically increased 100 per cent. Leather belting, tool steel, babbitt steel, wire nails, and fuel oil are also advanced 20 to 60 per cent.

"Ths will mean an advance in price on all farm tools of approximately $.75 to $1.00 a hundred pounds and possibly more. The steel mills reports sufficient orders on hand now to run their mills for nine months without taking another order, and the condition is getting worse all of the time.

"It is, of course, very uncertain just what will be done in time for another year's business commencing July 1, but it will undoubtedly be to your interest and the interest of your customers to keep them fully advised as to this condition, so that they will be prepared for the heavy advance next year and make their plans accordingly. There will be a shortage of farm tools for spring shipment due to the great difficulty in getting shipments of raw material at the present time, even on orders that have been placed many months ago."



CHOPS PRUNINGS IN ORCHARD.

[Written for Pacific Rural Press.]

Tree prunings are chopped up in the orchard for the San Joaquin Fruit Co. of Orange county. A Ross Little Giant feed cutter is mounted on two 4x6's laid edgewise as a bed on wagon wheels. It is set just in front of the rear wheels. A heavy sheet-iron hopper holds the prunings as they are pitched onto the wagon to be run through the feed cutter. Over the front wheels is a Root and Vanderwoort 5 h.p. gas engine which runs the cutter by belt.

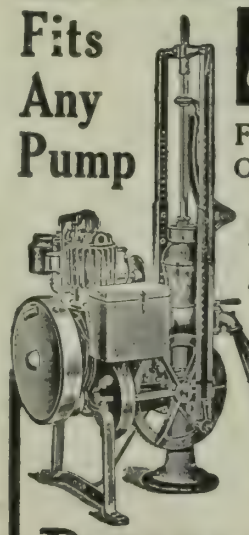
The ranch includes 600 acres of walnuts and 400 of oranges and lemons.

Layne & Bowler PUMP

Preparedness

—this one word is attracting more attention than any other national question of today. But laying aside the subject of national or military Preparedness, let's "get down to brass tacks" and consider the question of your individual Preparedness in providing ample crop protection.

Here in the West, the success of crops depends upon an absolutely reliable water supply. Every rancher knows this to be an indisputable fact. You can't be thoroughly prepared to raise successful crops, you can't be assured of the most profitable crops, unless you install a pumping system that can give reliable, unfailing service year in and year out; in addition a pump that will positively produce the cheapest water.



Be adequately prepared by installing the Layne & Bowler Pump, built to meet your individual requirements.

Write for Catalog No 25.

Layne & Bowler Corporation, 900 Santa Fe Ave. Los Angeles, Calif.

READ-MILLER CO.

Fits Any Pump

All You Want Of It

FROM 270 TO 2450 GALLONS OF WATER PER HOUR WITH THE

FULLER & JOHNSON FARM PUMP ENGINE

This Farm Pump Engine has been rightly called *"the mainspring of the farm."* Can be attached directly to any pump without extra fittings, special platform or foundations. It works in any kind of weather and will supply all the water needed for home or stock in the hottest and calmest days—for household or garden use—for washing buggies—fighting fire—for cooling porches—sprinkling lawns, etc.

No extras to buy. Comes complete in one crate, ready for instant use.

Remember there are 73 years of honest manufacturing experience behind this Farm Pump Engine.

It is not to be compared with cheap articles of the same sort which are *built merely to sell.* This engine is *guaranteed* and once you use it you'll say it's the best investment you ever made.

Our Low Price will surprise you.

Power

The Farm Pump Engine is also a complete power plant in itself. Relieves you of turning cream separator, churn, washing machine —in fact, anything that can be hitched to it. Runs steadily and easily and without vibration.

FREE BOOKLET

Let us explain in detail just what this pump can do and why it will pay you to own one. Send for our free booklet.

Pacific Hardware & Steel Co.

San Francisco.

Water

Andrew Cock, who has charge, showed us an orange stick ¾x2 inches across which had been cut to a 3-inch length. The orchards are pruned annually so not many sticks so large as this are found.

They cut the brush from 26 acres of six-year oranges and lemons in 1¾ days, using two men at a cost of $4.20 per day and two mules to haul the outfit through the orchard at $2 per day. The use of the machine is rated at $1.50 per day. It chops all the brush to pieces 2½ to 4 inches long and spreads them through the orchard where they will lighten the soil and will not have wasted the fertility used in growing them.

GASOLINE STRAINING DANGEROUS.

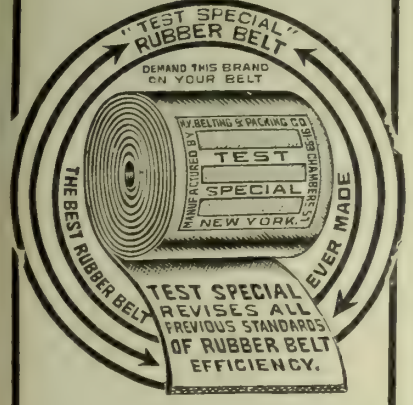
In a letter to this office J. N. Odell writes: "Apropos of an article in a recent issue of your paper advising people to strain gasoline through chamois leather, I am enclosing a clipping which may interest you. An automobile dealer tells me he tested this and found that the hazard described is existent and extremely dangerous."

The article follows:

Ross Brooks, chief of the Oklahoma City Fire Department, recently pointed out a new danger to automoble owners and motorists arising when a chamois skin is used as a strainer for gasoline, says the Pacific Underwriter. The danger and its remedy was alluded to by the chief as follows:

"It is a strange fact that not one motorist in a dozen knows that he is literally taking his life in his hands when he pours his gasoline through a funnel in which he has placed a chamois skin to act as a strainer. Statistics of fire departments in many cities show that an overwhelming per cent of auto fires are caused by this apparently trivial cause.

"Static electricity is formed by the friction of the gasoline passing through the chamois, which a careless motion may generate into a spark, causing a frightful explosion, which has several times occurred in the midst of a party of motorists, and the cause of which has until recently remained a mystery.



"So long as the funnel fits tightly into the mouth of the tank there is no danger. That carries a ground which keeps the electricity from gathering into a dangerous amount in the funnel. But when the funnel is held in the hand, or is separated from the conductor (in this case the metal tank) it becomes charged with one of the most powerful and deadly agents in the world, electricity. In many cases the motorist goes on his way, not knowing that he brushed elbows with death. For unless a ground is formed as the gasoline filters through the chamois, a spark will inevitably lean from the funnel to the nearest point of contact with the tank. Many persons have been burned and scarred for life, and several have been killed, through ignorance of this electrical phenomenon. Formerly somebody was supposed to have inadvertently struck a match when these sudden explosions occurred, but now investigation shows that the true reason is due to the fatal oversight of using the chamois skin in a suspended funnel.

"The moral of the whole thing is, never, under any circumstances, put gasoline through a chamois skin. The danger always exists, for electricity is a peculiar agent and it is an impossibility to know when the funnel being used so innocently by the ignorant motorist has received its maximum capacity of the statical current."

BELTING

that

Must Make Good

When you buy a rubber belt you should know what service it will give you or have the belt service guaranteed by a responsible firm who will make good in case the belt falls down. Every belt-buyer should know how to judge a rubber belt, and we would like to send you a **free sample** of **Test Special** together with our folder that will tell you just how to judge a rubber belt so that you may know just what service you will get from any belt you buy.

Fill out the coupon and mail it to us and we will recommend a belt that we will unqualifiedly guarantee to do your work satisfactorily. We have had seventy years' manufacturing and selling experience.

An Advocate of State Banking

To the Editor: While there is a lull in the verbal strife between the two versatile and talented Colonels I would like space to say something upon a subject which is, I think, of more importance than the one which has engaged the attention of my two esteemed friends. I refer to the question of cheap money for farmers. Measures pending in Congress are no doubt admirable in their provisions and calculated to do a great deal to relieve the existing conditions. Congressional action is necessarily slow and decidedly uncertain. Many years may elapse before any of the pending plans come to complete fruition. Such legislation must be national in its character and it will be found exceedingly difficult to adapt it to the various conditions existing in different parts of our country. For this and other good reasons it would seem that it would be the part of wisdom if this matter was left to the individual states to solve as local conditions demand.

Though the proposal to have the State take up this question was voted down at a recent election it by no means follows that the great majority of our people do not favor it. Fear of strengthening an already too potent political machine and of entrusting a great economic project to a number of job-chasing politicians caused many whom I have met to vote against it and no doubt was the principal cause of its defeat.

The tendency in California is toward small land holdings and intensive cultivation. There is usually a long interval between the settling upon the land and the procurement of a suitable and proper income from it. During this period the average farmer becomes pressed for money with which to carry on the work of proper development and because he cannot procure it in the usual way at a low rate of interest from the local bank many men, who would have succeeded and become prosperous farmers, fail. Every such failure works harm not only to the individual but to the community and to the State at large.

No security can be, or is, better than good land, yet it is the most difficult security upon which to borrow money in reasonable amounts. Bankers seem to lose sight of the fact that as custodians of the money of the public, they owe that public an obligation and should assist in the upbuilding of legitimate industries in which the people are engaged, so far as is consistent with safety.

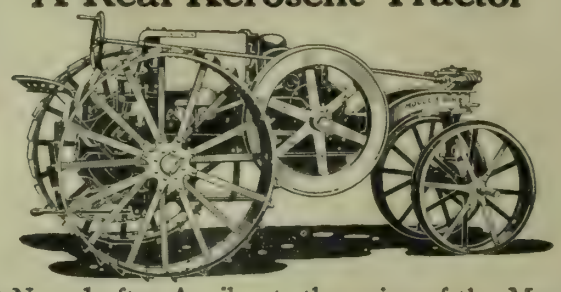
I can call to mind only one community in this State in which banks have pursued, and still pursue, a liberal and just policy toward the borrowing farmer. That is the city of Stockton where, unless conditions have changed radically of late, any deserving farmer can borrow 50 per cent of the actual value of his land at six per cent. The prosperity of the farmers of San Joaquin county and the sound financial condition of the banks mentioned testify to the wisdom and profitableness of this procedure.

In most localities the farmer who would borrow meets many difficulties, must pay a high rate of interest and in many cases is compelled to pay a bonus to a broker for borrowing what money he requires. There are some banks which refuse to loan directly upon country property which will accept a loan upon the same property from a broker who charges from two to five per cent for his services. Besides the brokerage the farmer must pay an interest charge of eight per cent and from three to five times the actual cost of sending a man to inspect his property. The banks are loaning the money of the people. Their own money is safely tucked away in government and other bonds and in improved city real estate. The Federal government lends them 90 per cent of their capital besides paying them two per cent upon the government bonds in which it is chiefly invested. Of all the tens of millions of dollars loaned by the National banks of this State, not one dollar belongs to the banks. The public supplies the money they loan and also provides the reserve fund which protects the loans.

Our National banking system is the most efficient device for enriching the few at the expense of the many, that human ingenuity has ever heretofore devised.

It is useless to call attention to an evil unless one can suggest a remedy. The remedy that I suggest is the carrying on of a banking business by the State. Bankers will cry "Socialism," "Paternalism," "Politics." There may be a trace of each to be found in the plan, but you will find the same thing in many others of our government activities. What these are the intelligence of your readers will recall without my enumerating them at length.

The State could carry on this business with a very small addition to its political machinery. We have an elaborate system involving a State and County Treasurer. There is an Assessor to fix values in every county and there is a Board of Control to supervise the whole business.



I will not trespass on your valuable space to go into smaller details. I am sure that the plan is feasible. I have given it years of careful consideration and am prepared to answer any objection which may be raised against it. It would not interfere with banks for loan and discount nor for the ordinary commercail transactions, but it would do away with the evils of our existing system of banking.

Savings banks would be only slightly affected, though many of these require a radical change in their procedure, as the following incident will show: A friend applied to a large savings bank for a loan on country land. The cashier told him that the bank was anxious to make good country loans and asked how much was wanted. "Four thousand five hundred dollars," was the reply. "Too small," said the cashier. A few days later he applied for a loan for a client who wanted twenty thousand dollars. "Too large, too large," was the reply.

I hope that this rambling screed will evoke a general discussion of this question. State banking will mean cheap money for farmers and that will mean prosperity for the country as well as the cities, for the latter depend almost entirely upon the former. H. J. Corcoran.

Esparto.

Mogul 8-16
A Real Kerosene Tractor

ON and after April 1st, the price of the Mogul 8-16 tractor will be $725 cash f. o. b. Chicago. All bona fide orders received up to April 1st will be accepted at the present price of $675 cash f. o. b. Chicago.

We are making this announcement early so that our thousands of friends who are thinking of buying Mogul tractors will be posted on future prices.

After all it is not the **price** a man pays for a tractor which is of the most importance, **but what its power costs. A Mogul 8-16, burning kerosene, in five thousand hours of work will more than save its original price over the cost of the same power produced by a gasoline tractor.** Remember the **Mogul 8-16 is a real kerosene tractor,** planned and built originally for using this cheap, plentiful fuel.

This readjustment of price is of minor importance compared with the wonderful saving which a Mogul 8-16 will make. It is necessary owing to the advance of prices in the raw material market. There is no change in the original policy to sell the Mogul 8-16 at the lowest possible price, always maintaining Mogul quality, but materials are almost unobtainable, even at an advance in price of from 50 to 100 per cent over prices of a few months ago.

Orders placed at once will stand the best chance of being filled in time for spring work. **See the Mogul 8-16 dealer, or write us.**

State Butter Record Smashed

A seven-day official record of 34.135 pounds of butter from 532.4 pounds of milk was completed February 25, by the five-year-old Holstein cow Alba Sadie Cornucopia Creetia, owned by Mrs. Anita Baldwin of Los Angeles, according to Supt. W. H. Taylor.

Alba Sadie Cornucopia Creetia (139651), Who Now holds State Record for Weekly Butter Production.

This is .295 pounds more than the State record made last year, and Alba Sadie is sailing ahead to smash the 30-day record of 128 pounds, made three years ago. Her test has been averaging five per cent.

This cow was bought by Mr. Taylor for $1550 in Colorado for another party and was later bought by Mrs. Baldwin. Earl Sturgis, who had charge of Tilly Alcartra, while she was making her world's record, is now officially recording Alba Sadie's performance.

The ration being fed daily is 76 pounds of carrots; 12 pounds equal parts bran and barley; four pounds soy beans; two pounds cotton seed meal; 10 pounds alfalfa hay and 20 pounds of oat hay.

Last year, two months after this cow was shipped from the East, she made 28.85 pounds of butter in seven days. She is a granddaughter of Sadie Vale Concordia, who once held the world's butter record.

Banks Should Loan Money on Dairy Cows

Practically all of the money that has been loaned to farmers on dairy cattle in this State in the past has come through the various creameries in the State. That such a condition is not a good one for the dairyman is obvious, as it practically places him at the mercy of the man to whom he sells.

Banking officials argue that the creamery man is the only one who can loan with safety on dairy cattle, because of his opportunity of keeping in closer touch with the collateral (cattle) than would be possible for the banker or other money loaner.

Maybe that is true as the law stands in California. If so our livestock interests should get busy and see that the law is changed. In the middle west bankers are evidencing a desire to promote the dairy industry and the following argument by F. W. Merrill of the De Laval Separator company is suggestive of why the dairy farmer needs and should have the hearty co-operation of his local banker or money lender.

It is safe for the bankers of a community to finance the dairy cow proposition. There are, of course, chances to lose out on a deal of that kind, but our bankers as a rule are conservative. They know their customers well and can manage the undertaking in such way as to come out even if they will study the proposition from all angles.

A large majority of our farmers, whether they are on the small irrigated farm, or on our dry land farms, or are located on humid sections, are not financially able to pay "cash down" for dairy stock, and even if they were—there are not many men who want to go away to purchase just the few with which they want to start. It would be too expensive for each farmer to follow a plan like that. Even if this were possible, it would not be a good policy because there would be no community interest, no co-operation among the farmers for the production of uniform stock, and a large number of failures are likely to occur, resulting from the purchase of poor stock.

Dairying is a co-operative proposition from the breeding of the cow to the sale of the finished products. No matter where you look for successful dairying, in foreign countries or in our own prosperous dairy sections, you find it most profitable and most successful from every point of view if there is a form and spirit of co-operation among all those interested. No community is financially able to start and develop four or five dairy breeds, but any community can develop one to the extent that in 15 or 20 years it would have a surplus of dairy stock to sell, and the fact that the stock were all of one kind would advertise the proposition everywhere and bring buyers from far and near. Why do we go to Jefferson county, Wis., to buy Holsteins or to Waukesha county, Wis., to buy Guernseys? Because the people of those counties decided 25 years ago to breed one kind. The best feature of this proposition is the opportunity it affords for good breeding. A few high class, well bred bulls—bulls whose sires and dams are animals of merit, could be used exclusively in the community and breed up the native stock. After all is said and done—there is no better way to start dairying than to grow into it, by purchasing purebred bulls and breeding them to native cows which show dairy qualities.

The bankers should have it understood among the farmers that they are buying the foundation stock, and the object of buying is to enable them to get started along the right lines and to build permanently. I think it is not asking too much of the farmers to have it distinctly understood before purchases are made that they will, by the continuous use of pure bred bulls, breed up the stock they already have to a high standard. So instead of having for our slogan, "Buy Cows," let us make it "Buy Bulls."

The idea of purchasing cows for the farmers is not for the bankers alone, but for all business men. In some of our northwestern states the realty men, who are interested in the permanent development of the country and are locating people for that purpose and not for mere speculation, are devising plans to assure the newcomer of a permanent living. To do this they provide the settler with some dairy cows and one or two good brood sows.

They know that if a man will milk cows he has something to sell every day in the year—his living is provided—he has no store bills accumulating beyond his ability to pay. If drouth comes he does not have to pick up and move. He must necessarily raise a variety of feeds. He has some manure to put on the land, and thereby keep up its fertility, and increase its water holding capacity. He erects some permanent buildings for his stock, and when all the farmers are doing this it gives the country stability and permanency.

WOULD SILAGE INCREASE PRODUCTION?

To the Editor: I have a herd of eight Jersey cows which gave an average of 206 pounds of butter fat last year. I fed alfalfa hay and green alfalfa when it was obtainable. I want to know how much I could reasonably expect them to gain by feeding them silage five months in the winter.—V. I. T., Manton.

[Answered by C. G. McFarland, Tulare.]

[I would say that your subscriber could easily expect an increase of 25 per cent in returns by feeding good corn silage five months in the year.]

How a Milking Machine Helps.

[Written for Pacific Rural Press.]

H. D. Fowler of Modesto is paying $20 an acre rent for 40 acres and is milking 25 cows. He says that he is making a good living out of it, and is not killing himself either. The drudgery of the work has been removed by the installation of a Calf Way Milker. The cows are milked in an hour and twenty minutes by one man. No stripping is found necessary with these machines and Mr. Fowler is of the opinion that the practice of following the machines by stripping is not good as the cows have a tendency to hold back more of the milk to be stripped. After using the machine for six months, he is convinced that the cows' bags are in better shape than from hand milking, that their milk is cleaner, and that dairying is a pleasure rather than a drudgery.

Another thing that Mr. Fowler is constantly on the lookout for is high-producing cows and sometimes gets one that is a bad kicker. He says that he has never had any trouble in getting them to stand for the milker.

He belongs to the Stanislaus Cow Testing Association and says that he can't afford to keep a cow that does not average a pound of butter fat per day during the milking period. His 25 cows average nearly 1½ pounds.

He gets up at 6 a. m., his cows are milked and ready for breakfast by 7:30. After breakfast he goes to work in the field while his father separates and cleans up. He can work in the field until 5 p. m. and then come in and do his milking and sit down to supper by 7 p. m.

He expects to add 10 more cows to his herd as he can manage that many more without any trouble and he is raising plenty of feed for thirty-five.

Rice By-Product for Hogs.

To the Editor: Can you tell me what should be fed with rice middlings to make a well-balanced ration for hogs? As rice middlings are high in carbohydrates, I want to know what should be fed with it, and in what proportion, to get the very best results. I want to give it a trial.—W. M. M., Manteca.

[Answered by Prof. F. W. Woll, Univ. Farm, Davis.]

[Rice middlings is probably a new name for rice bran or rice meal, a by-product from rice mills, which makes a valuable feed for swine and other farm animals, when from fresh stock and free from adulteration with rice hulls. It is considerably lower in protein and higher in oil (fat) than either wheat bran or middlings, while it contains more carbohydrates than wheat bran and less than wheat middlings. A good quality of rice bran will contain, on the average, the following amounts of digestible components: protein 7.9 per cent, carbohydrates 38.1 per cent, fat 8.8 per cent, nutritive ratio 1:7.3. It is preferably mixed with ground grains (barley, Indian corn, milo, etc.) in feeding hogs, in equal parts by weight, and fed in a slop with skim milk, about one part of grain to three or four parts of milk; two or three pounds of grain being fed per one hundred pounds of hogs. For growing animals, an addition of a small amount of tankage, say 10 to 12 per cent of grain mixture, will be advisable, especially if skim milk is fed in only small amounts or not at all. A good grade of tankage furnishes a cheap source of protein and makes an excellent component of rations for young pigs when supplied in the proportion stated. Linseed oil meal, cocoanut meal or cottonseed meal may also be used to increase the protein content of the ration, but they are relatively more expensive than tankage for this purpose. Cottonseed meal can only be fed in very small amounts to pigs with safety, making up not over one-fourth of the grain mixture, and even then only for a period of four to six weeks at a time, owing to its toxic properties.]

KEEPING MILK SWEET FOR PIGS.

To the Editor: Is there anything that can be added to skim milk to prevent it souring that will not be injurious to small pigs?—P. B. L., Tulare.

[Formaldehyde, borax and salicylic acid have all been used in the past by unscrupulous milk dealers as a preservative of milk and we suppose any of them would suit your purpose, but we do not know how much of either to use with safety. Lime water might do the trick and would not be dangerous. Use one gallon of lime water to 10 gallons of milk and see whether it has the desired effect. Anyway it seems to us you are going to a lot of trouble for nothing, as sour milk is, if anything, better feed for pigs than sweet milk. It would be a good idea to heat your milk to a temperature of 150 degrees F. before feeding. This would probably keep it sweet somewhat longer and would also guard against tuberculosis infection from the skim milk.—Editors.]

COWS NOT PASTURED.

[Written for Pacific Rural Press.]

The cows which produce milk to be bottled and sold in Holtville, Imperial county, are not pastured at all in summer, but are fed about 30 lbs. each of freshly cut alfalfa twice a day in the mangers and dry hay ad libitum in corral feed racks. The green alfalfa usually wilts before it can be brought in, and no bloating has ever occurred In the corral the cows average about 30 pounuds of hay per day.

In winter the cows are turned on green grain to pasture when it is not too wet; and then they do not seem to care for the cottonseed which is fed at other times to keep them up in flesh during winter.

There is not enough rain ordinarily to muddy the corrals; and they are easily kept clean with a buck scraper.

An inquiry for 40 Duroc boars in a bunch had to be turned down recently by Peters, Lamson & Walker of Devore because they were nearly sold out.

REMCO
REDWOOD PIPE

All diameters from 2 inches to 12 feet. Much cheaper than any metal pipe. Will carry 30 per cent more water than metal or cement pipe of same diameter. Will outlast any metal pipe except cast iron. Cannot be injured by roots or displacement. Furnished for any pressure from 0 to 400 feet, and guaranteed for 100 per cent overload.

Write for further information, prices, etc.

REMCO
Redwood Tanks

Cheaper than metal tanks. Last longer. Cannot rust. Not affected by chemicals in water. Thousands in use in the West.

We make them in all shapes and sizes, from 200 gallons to 500,000 gallons.

Redwood Manufacturers Co.

1608 HOBART BLDG., SAN FRANCISCO.

40 Shorthorn Bulls and Heifers

REGISTERED AND TUBERCULIN TESTED.

NOW, at my farm at Perkins, 6 miles East of Sacramento.

This stock was purchased from the best herds in Nebraska for my California trade, and are as fine a lot of one and two-year-olds as I could secure. Inspection invited. Call and see them before purchasing elsewhere.

Also have a few registered **BERKSHIRE GILTS** for sale.

I will leave shortly for the East to fill orders for Shorthorns and Herefords. Write me at once of your wants so that I may fill your order on this trip.

SHORTHORN CATTLE

Shropshire and Merino Sheep

FOR SALE, SINGLE OR CARLOAD LOTS

KING LANCASTER,

Son of King Edward, Grand Champion Bull California State Fair 1909, 1910, 1911. The only Bull 3 times Grand Champion at State Fair.

My range-raised bulls this year are the finest lot I have ever had.

THEY HAVE GRAND CHAMPIONS BEHIND THEM.

Dairymen of San Joaquin county recently held a banquet at the Hotel Clark, Stockton, at which the State law on tuberculin testing, which goes into effect October 1, was discussed.

Princess of Meadowbrook 25185, Guernsey cow owned by the Elliott Brant Rancho of Owensmouth recently made a new State record of 14,000 pounds of milk and 825 pounds of butterfat in one year.

Making Alfalfa Produce More.

[Written for Pacific Rural Press.]

Fertilization of alfalfa is commanding more and more attention in Stanislaus county, due to the considerable falling off in yield which has been pretty general there during the past few years.

An experiment in this respect which is out of the ordinary was carried on by J. M. Bomberger on his ranch north of Modesto last year. He applied 220 pounds of gypsum and 80 pounds of sulphur to the acre, using it on two checks, and setting aside two other checks, having equally as good a stand, to compare results with. At the end of the season those checks which were fertilized had produced about one-fourth more than the two left without fertilization.

Another experiment which Mr. Bomberger is trying out this year is with alfalfa seed. Last summer he observed that a scattering lot of alfalfa on the south bank of the drain ditch which runs through his ranch, matured a fine lot of seed. The alfalfa had been left on account of its being too wet to cut with the mower.

After watching the development of the seed grown along the bank he decided to see if he could not get a better germinating seed by cultivation. With that in view he has plowed up a three-foot strip, leaving a foot strip of alfalfa in two checks. By cultivating in this manner he believes that the sunshine reflected from the ground and the better circulation of air will improve the germinating qualities of the seed.

When asked why the life of alfalfa on so many ranches is short, he stated that in his opinion it is cut too close in the fall, just as it is becoming dormant. He maintains that close feeding weakens it to such a degree that quick sprouting foxtail gets a start on it in the spring and uses up a good deal of the plant food that the alfalfa should get. He has found it a good practice to leave a three or four inch stand in the fall instead of pasturing it close as is the common practice.

1480 Hogs on 25 Acres.

[Written for Pacific Rural Press.]

A specialized purebred Duroc hog ranch where convenient use of alfalfa pasture reaches the top notch, is that operated by Peters and Lamson near the Mexican boundary south of Holtville. Not over eight sows and their pigs are kept in each of ten woven wire pens enclosing 1¼ acres each of alfalfa. Every three weeks in winter and every ten days in summer, these pens are irrigated, while the pigs and sows are transferred for the same length of time to ten similar pens just across an alley. Alfalfa gets good growth while they are off.

The object in keeping not over eight sows together is to prevent them from piling up at night. That would make them come out in the morning with fever and watery eyes and might start them to pneumonia.

Opensided shades of old hay or straw on hog wire stretched over a frame on top of fence posts at the pen corners supplement the shade-trees. Sun heat does not penetrate hay like it would shingles or metal roofs.

Water is piped to each pen from a high galvanized iron tank into which it is pumped.

"Cool clean water to drink and plenty of shade will pull them through any summer. Wallows are unnecessary. They might be desirable if they could be kept clean and frequently drained, but there is no drainage here. Stagnant, foul places breed germs. We have no mudholes. There are always loose panels lying handy to set up around wet places until they dry. We keep the animals clean so the dip or spray we have to apply frequently for lice will take effect," says L. L. Lamson, who has charge of this ranch.

Dwarf milo corn or barley and tankage are bought to complete the ration. One grain is used when the other is more expensive. The pigs are usually about eight weeks old when taken from the brood pens to the alfalfa pastures. They eat about 2 per cent of their weight every 24 hours, a mixture of 95 per cent soaked corn and 5 per cent tankage. The corn is to be ground in the future.

As the pigs grow older, a creep is arranged so they can get to self-feeders in which corn and tankage are separate. Pigs under 100 pounds eat as much tankage as 7 per cent of the total, while at greater age they come down to 3 per cent. No milk is needed with the tankage and alfalfa—milk is hard to keep sanitary—and they have no cows anyway. After the creep is put in, the sows will not get all the feed they want, because they must not be permitted to get fat.

The alley between the alfalfa pens contains a dipping vat of permanganate of potassium or a coal tar preparation. The animals must go through this every time they are changed to the other set of pens.

Every pig and hog was recently vaccinated, and the brooding and fattening pens are separate, but those are other stories.

GRANDSONS OF TILLY ALCARTRA

At Prices within Reach of Every Breeder and Dairyman.

A Grandson of Tilly Alcartra.

We have several splendid grandsons of this now famous cow which we can deliver to you at prices which will suit the pocketbooks of every dairyman wishing to improve the quality of his herd, whether it be a grade or pure-bred herd. These bulls are sired by our herd bull, Prince Alcartra Korndyke and out of A. R. O. cows, and are the only living grandsons of a cow having a record of over 30,000 pounds of milk in a year. Such an opportunity for increasing production has never been offered **DAIRYMEN AND BREEDERS** in California, price and quality considered. Buy one of these bulls and solve your low production problem. Write

DAIRYING.

The Oakdale Creamery of Oakdale is now putting out 7800 pounds of butter daily, the largest output since the plant was started.

Jake Mull of Tulare is the owner of a Jersey calf only 11 inches tall, weighing only 20 pounds, but perfectly normal otherwise.

Cows on the San Joaquin County Farm near French Camp are averaging 30 pounds of butterfat per month for the 41 animals under test.

An important conference was held on March 4 at Eureka between the directors of the Humboldt County Farm Bureau and the creamery operators of that county.

A three-year registered Holstein bull was bought last fall for $250 from a San Bernardino dairyman for the Sherman Indian School ranch near Arlington. About 50 Indian boys and girls are learning agriculture and domestic science at the ranch, by doing the work.

The six-year registered Guernsey bull, May King of Fern Ridge 17432, owned by C. W. Main of Corona, is by imported King of May and out of Yeoman's Hayes Felois. He took third prize at the Panama-Pacific Exposition, having been fitted for only a month previous to the show.

St. Mawes Beauty 295047, the Jersey heifer bred and owned by Ed. Cary of Carlton, Ore., which was awarded first place in the two-year-old heifer class at the Panama-Pacific Exposition has completed a year's authenticated record of 10,239 pounds of milk and 586.8 pounds of fat.

H. E. Cornwall of Stanislaus county sold four bulls and two heifers to C. F. Austin of Milford Valley, Utah. Two of the bulls are from his blue ribbon cows at the 1914 State Fair. Mr. Austin bought about 90 head of grade dairy cows around Modesto and will use the Cornwall stock as his foundation herd.

After two conferences with State Market Director Col. Weinstock, the committee from the Bay Counties' Dairy Co. have been unable to arrive at any definite agreement with the San Francisco milk distributors' association. It is understood that the producers are asking 16¾ cents per gallon for milk beginning July 1, 1916, while the distributors claim that there are many dairymen who are producing milk for 15c and still making a good profit. Col. Weinstock is endeavoring to ascertain the cost of producing milk before recommending any fixed price per gallon.

HORSES AND SWINE.

Peters, Lamson & Walker of Devore and Holtville have 60 registered Duroc sows now and expect to work up to 100.

H. S. Boudier & Son of Napa county recently shipped a registered Duroc-Jersey sow to Jas. Cass of Cayucos, Cal.

Starting with 10 bred gilts 6 to 8 months old, in August, 1914, J. E. Hollingsworth of Hemet has increased his herd to 225.

Members of the Imperial County Boys' Pig Clubs held their first get-together banquet at El Centro recently, dining on roast pig.

The stallion, Indices, property of the Gridley Percheron Horse association, died last week. The association loses several thousand dollars as the horse was a fine one.

Hogs do better in Imperial Valley without wallows, according to a well-known breeder, because where they have them, they continually run back and forth to the water and out again.

N. D. Dutcher & Son of Livermore recently lost two valuable stallions in a fire—King Clyde, a Clyde, and British Oak, a Shire—which have been in the Dutcher stud for several years.

Dr. J. A. Crawshaw of Kings county has ordered from a breeder in Indiana two young sows and a boar of the spotted type of Poland-Chinas. At present there are no specimens of this type on the Coast.

Gorham and Rankin have sold the "Double Square" ranch in Nevada to Ed Partridge of North Dakota, together with 5000 to 6000 head of horses. This ranch has become famous for its horses, one of their regular customers being the U. S. government, which purchased several carloads yearly for use in the cavalry.

H. L. Murphy of Perkins writes us from Lexington, Ky., as follows: "I am writing to inform you that I have just purchased the great herd boar of Elmendorf Farm, Rival's Robin 2nd 195518. I think this is the greatest boar I have ever seen. This boar at the head of my herd mated with the type of sows I have, should give great results. I also purchased some sows. I go from here to Missouri to buy Shorthorn bulls."

The Oak Knoll Hog Ranch of Napa have moved 340 head of their O. I C registered hogs to a ranch that they have recently bought near Salida. They intend to fit up the place as a modern hog ranch. They have also purchased the old Butter's place near Ripon and will keep part of their herd there. The Oak Knoll people do not believe in having their eggs all in one basket so are branching out into the Berkshire game, having recently bought several fine brood sows and a boar from A. B. Humphrey of Escalon.

Chas. R. Hanna of Riverside is negotiating for a son of the Poland-China boar, Pritchett's A Wonder. Mr. Hanna has a bunch of beautifully built registered hogs including the two-year sow, Glenview Beauty, of his own breeding. He figures that this sow alone returns him interest every year on $1000 valuation. She has eight fine pigs now. Her bones are not as large as some, but are sound and compact. He has a 23-months boar sired by Iowa King and

Special Live Stock Market Report.

There has been no change in the local cattle market the past week, although light cattle continue to be scarce. There are still some cattle in packers' feed lots in Nevada and California and these will probably supply this market till the grass cattle start to come. A recent visitor to Idaho and Utah reports plentiful supplies of both light and heavy weights in those two states.

Lambs are a little stronger than reported last week and while there have been a few straggling bunches of spring lambs on the market it will take another three weeks to bring out supplies for anything like a general trade. Idaho and Utah are both reported to be extremely short on sheep and lambs, which strengthens an already strong feeling here.

The hog market continues to get stronger and the same condition is apparent in markets all over the country. Shipments have started from Idaho and Utah to this market but have not as yet assumed any importance. Too many light hogs are being offered to hold up quotations on that end well and it looks like good business to hold them in the feed lots for more weight.

WOOL.

Wool is now selling at the highest point in 30 years in face of the fact that 75,000 bales went through the local port during January and shipments from Australia continue to be heavy. Whether it is wise, in view of this, to delay selling, seems problematic. The Australian market is 10 per cent off and the London sales opened the last day of February 5 to 7½ per cent lower all the way round. Buying is reported to be still going on actively in the country considerable wool being contracted for at Red Bluff from 22 to 26 cents. At best the situation looks risky and the man holding wool, either in storage or on the back, would seem to be gambling.

LIVESTOCK DIRECTORY.

Rates in this directory, 3c per word each issue; or if carried weekly for one year, 2½c per word.

HORSES AND MULES.

8 JACKS FOR SALE from 1 to 6 years, or will trade for fillies or heifers. We took all prizes for mules at State Fair, 1913. Kelley & Son, R. D. 3, Box 93, Lodi, Cal.

SWINE.

BIG TYPE POLAND CHINAS—One to a carload. Any age, either sex. 600 on hand. They have plenty of size, extra good hams and shoulders, strong arched backs, great length, depth and thickness of body, with good looks as well. Many are sired by IOWA WONDER, a 1000-pounder in show condition. I believe his pigs are the best in California. Visitors say they are the best they have ever seen. He sires the kind that grow faster and larger, have more, better and stronger pigs, and are more practicable and profitable—the kind that are highly satisfactory. Extra special prices on account of being overstocked. I have hogs galore. Prices will surprise you. Satisfaction guaranteed. Write Geo. A. Smith, Corcoran, Cal.

BILLIKEN HERD OF IMPROVED CHESTER WHITES—Everything registered and Cholera Immune. Have two young boars of service size and a few bred gilts to offer. These are extras in every way. Price very reasonable. Have recently received some bred sows from the East that are from Grand Champions and are bred to Grand Champions, from the best and most popular blood lines. Will have an attractive lot of pigs to offer from the coming spring farrows. These will be the equal of any raised in this country. Am booking orders now for same. Write for prices and catalogue. C. B. Cunningham, Mills, Sacramento County, Cal.

YOUNG POLAND CHINAS—Large type boar, "I. B. A. Wonder," won first in class and Reserve Champion P. P. I. E. 730 lbs. under two years in breeding condition. Sows bred and sired by "I. B. A. Wonder." Also weanling pigs, either sex. Trios unrelated. None bigger. None better. $15 and up. Will please you or money refunded. W. A. Young, Lodi, Cal.

REGISTERED DUROC-JERSEYS—Prize-winning stock from Iowa, Nebraska and Wisconsin. 75 head—bred sows and gilts. Also weanlings in groups of from one to five and boar unrelated of Crimson Wonder, Golden Model, Alvancer, Golden Hero, Orion, Chief and Colonel blood. Price $10 and up. Haden Smith, Route 1, Box 97A, Woodland, Cal.

BLUE RIBBON HERD OF DUROC JERSEY HOGS—With 125 head of choice gilts and boars sold in year of 1915. I am going to sell 150 head in 1916. They sell because they are choice, and people are given a Square Deal on good ones. I have no $10 and $15 kind. I don't have to auction them off. John P. Daggs for prices, Modesto, Cal

DUROCS OF QUALITY—Predominating bloods of Defender, Buddy Ky, Crimson Wonder. C. T. Thompson, Bishop, Cal.

BERKSHIRES—Carruthers Farms, Mayfield, Cal.

out of a cross between Otts Big Orange and Long King's Equal.

The Glenn county Berkshire association was organized recently, with fifteen members, representing five to six hundred purebred hogs. The officers of the association are W. S. Guilford, president; L. H. Tweede, vice-president; Carl Ley, secretary-treasurer. Board of directors: James Mills, L. H. Tweede, G. M. Clare, O. L. Roper, G. O. Lovett, Wm. Durbrow and W. S. Guilford. This new organization proposes to help establish more pure-bred herds in its district; its members agree not to sell a registered hog worth less than $20; and to hold hog sales which will be kept up to a high standard.

CATTLE AND SHEEP.

Livestock worth $1,223,500 has been shipped from Klamath county, Ore., between July 1, 1915, and Feb. 10, 1916.

More than thirty carloads of Nevada cattle have recently been shipped to the Montezuma hills in Solano county for pasturage.

The Supply Department of the Panama Canal will shortly establish a large cattle ranch on four thousand acres of land in the vicinity of New Culebra. It is proposed to purchase 10,000 cattle and to fatten them on the ranch for the use of the Supply Department.

The University of California recently completed a six-weeks test at Davis fattening 249 lambs for market. The results indicate that silage, whether made of Indian corn, dwarf milo, or sorghum, can be economically used in a ration which includes barley and alfalfa hay.

Richard Glanville has sold his Clear Creek ranch in the Winnemucca district of Nevada to Liotard, a Golconda sheep man. The property consists of approximately 1,700 acres of land with first right to the waters of Clear Creek, and the purchase price is said to have been in the neighborhood of $30,000.

Instead of herders being compelled to stay awake at night to shoot in order to keep coyotes away from their flocks they will be able to have it done automatically by a new invention which has recently been perfected by several sheep men near Salt Lake. The invention consists of an apparatus that stands on a tripod and consists of a tank from which dioxide gas is fed into a gun. It can be set to explode at various intervals and will run fourteen hours without attention. Attached is a light which burns constantly and throws a glare 300 yards. It can be operated all night for 7 cents.

A Chicago exchange says this about the sheep market in the east: "The sheep market has surprised nobody connected with the trade. The handwriting was on the wall in legible characters. Mutton and lamb have got into the same category of luxuries as lobster and terrapin, and the only limit that can be detected is the capacity of the consumer to buy the stuff. Mutton is not, however, carrying the entire load, as pelts are commanding $2.25@2.50 each, and pulled wool has never sold as high since Noah stocked his justly celebrated ark. Bets have been made that before the Colorado lamb crop has gone to the shambles $13 will be paid for fleeced lambs at Chicago, and Robert Matheson, who is rarely known to forecast higher prices, says the 1916 lamb crop will put more money into growers' pockets than

MISCELLANEOUS.

L. A. Bridinger shipped two Saanen bucks to L. D. Stocker at Hermosillo, Mexico, last week. They were selected from Mr. Bridinger's prize herd on the Braley stock ranch at Santa Rosa.

The Widemann Goat Co. recently filed articles of incorporation in Monterey county. This will be the largest concern of its kind in the world, the business consisting of the buying and selling of goats and the manufacture of condensed milk. Gonzales is the principal place of business.

Easton and Ward of Burlingame report having sold a Shire stallion foal, Rampton President, to a buyer in San Benito county. They have just recently purchased three foals from Henry Wheatley of Napa, one of which was a first prize winner at the P. P. I. E.

Louis Hestorf of Monterey county recently shipped a carload of dairy cows to W. C. Crow of Crows Landing.

ORGANIC MANURES HELP NITRIFICATION.

Dr. W. P. Kelley of the graduate school of tropical agriculture of the University of California at Riverside, reports that in observing the nitrification of dried blood in soil from plats where the University has carried on experiments with different types of fertilizers for the past eight years, he found that the dried blood was more rapidly changed into a form available for plant food in soils which had been consistently fertilized with organic manures than in soils which had not been so fertilized, and that nitrification proceeded more rapidly when the concentration of the dried blood was reduced.

SWINE.

CHESTER WHITES (O. I. C.'s)—Bred gilts, $30. Bred sows, $45. Weaned pigs, $10. Also a fine herd boar 20 months old. D. Bache, Hollister, Cal

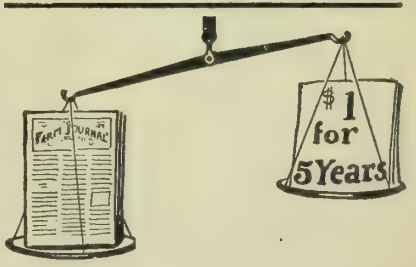
P & O

No. 6 Success Sulky Plow

A frameless plow in which are combined simplicity, strength, durability, service and moderate cost. It has every feature essential to the performance of perfect work. "It's the Way We Build Them."

Made in 10, 12, 14, 16 and 18 inch, right or left hand, and can be equipped with the style of bottoms which will exactly meet the most rigid requirements of any soil. Hundreds of thousands of these popular plows are in use in all parts of the country.

Heavy high carbon steel beams; high throat gives great clearance for trash. In turning, the rear wheel castors automatically, going back to its natural position as the plow resumes a straight course. Hitch adjustable for 2 or 3 horses, and for different depths. Eveners can't drop down on heels of horses. Will plow from 2 to 8 inches deep. Cushion spring absorbs all jolts and vibration when working in rough ground. Conveniently placed levers give easy control of plow. Wheels equipped with dust proof boxes, with sand bands and screw caps for using hard oil. Bottom is built on heavy double ribbed frog. Alfalfa shares interchangeable with regular shares.



Rolling coulter has a chilled cone take-up bearings. Rear wheel adjustable up or down to throw the plow on the point. Heavy axle saddle securely bolted to axle and beam; can't slip. Tongue Attachment and Swinging Hitch Attachment can be furnished.

Some Questions About Hog Selling.

To the Editor: I have understood from numerous published statements, that California produces only a small proportion of her pork products. It has been given out as about 6 per cent of the amount consumed by the people of California. According to reports issued by the federal government (statements of Senator Smoot of Utah on the floor of the Senate January 13th, 1916) there were exports in the year 1913 of cattle, hogs, horses, sheep, mules, and so forth, $5,600,000, while for the year 1915, they were $96,200,000. In a report furnished by the Secretary of Labor to Senator Stone of Missouri and published in the Congressional Record January 13, 1916, the total exports from the United States to belligerent countries of Europe, to Canada, Japan and Asiatic Russia, etc., were as follows:

Articles	1915	1913
Bacon	$ 6,978,754	$2,380,999
Hams and shoulders	2,768,800	1,853,314
Beef, fresh	1,345,320	37,055
Beef, canned	463,638	48,495
Total ...	$11,556,512	$4,319,863

In view of the published statistics, it will be interesting to receive some explanation as to why the farmers in central California are being offered four and one-half cents per pound for actual grain-fed hogs.—M. A. R., San Joaquin Valley.

[We agree with you that the basis of price fixing with livestock is a baffling one to the ordinary layman, so we secured the following advice from a responsible acquaintance with a complete understanding of the subject. From him we learn that if all the hogs which have been butchered during the time for which you give figures were ham and bacon the increase in exportations would have had, probably, a more beneficial result on the price of live hogs than it did. But the marketing of those two products does not nearly solve the problem. From all accounts soft corn and high grain prices seem to have had more to do with the eastern prices than anything else, as the farmers figured there was more money in selling their grain than in feeding it and accordingly dumped their hogs. This condition prevailing all over the country caused some of the biggest runs of hogs at all of the markets ever experienced.

Now, as has been said, if all of the hog was bacon and ham the increased outlet would have taken care of these heavy runs, but there is the lard, fresh meat, etc., to be taken care of also, and at that time lard could not be shipped to Germany, our heaviest customer, and the surplus of cuts which had to be marketed fresh bore down that market. The result was that the supply was greater than the demand and that occasioned a lowering of prices to retard further offerings.

The exportation of meats of all kinds to countries at war in Europe does not affect our market as there is no increase in exportation of either pork or beef from this coast on that account. The only way that our market would be affected would be to the extent that these exports would affect prices in the east, and the weakness of their market this winter has undoubtedly had some effect on the situation here.

All we can say about the fellow who bought your hogs at four and one-half cents a pound is, that he was a better buyer than you were a seller. The lowest price paid for hogs weighing 150 to 250 pounds, delivered and weighed off cars in San Francisco during 1915 was six and one-quarter cents, that being the market for about three weeks. That was the first time that hogs had sold at that price in this market for a long term of years, our present quotations showing a much higher level.

The local buyer naturally has to have something for his work and the shrinkage in shipping, but two cents a pound is too much. You can market your hogs direct if you have a carload, and any of the San Francisco packers will quote you prices f. o. b. San Francisco which are good for a week. If you haven't enough for a carload, arrange with your neighbors to make up a carload between yourselves.

At the present time California is producing about 50 per cent of the pork consumed in the State, although it was not more than 35 per cent two years ago.—Editors.]

RELATIVE VALUE OF BEETS AND BEET PULP.

To the Editor: Will you please tell through your paper, what the food value per ton is of cow beets for a dairy, and how they compare with beet pulp, also the price per ton? I am now feeding beet pulp, but have a chance to get the fresh beets if wise to make the change.—E. H. F. O.

[Answered by Professor F. W. Woll, University Farm, Davis, Cal.]

[I take it that cow beets is another name for some variety of mangels or common beets. Varieties of this field crop vary considerably in water content, and therefore also in feeding value, but there is no appreciable difference in the average figures for mangel and beet pulp as regards the percentages of total feed components or digestible nutrients which they contain, and they may on the average be considered of similar feed value, ton for ton. Neither of these feeds has a definite commercial value, as they must be fed on or near the ranch where they are raised, or the factory, respectvely. As ten tons of wet beet pulp will make about a ton of dried pulp, one can arrive at a fair basis for comparison of values by assuming that mangels are worth about one-tenth of the prevailing market price for dried beet pulp, say $2.00 to $2.50 a ton. Sugar beets which contain approximately twice as much dry matter as mangels would be worth at least twice this figure for stock feeding.]

WHO HAS LITTLE POLAND CHINAS?

To the Editor: Please inform me through your columns, where I can get the Little Poland China hogs.—J. W. Wimmer, McKittrick, Cal.

[We presume you mean medium type Poland Chinas. Many of our advertisers breed that type and we will leave it to their progressiveness in booking orders to get in touch with you. Some of them state in their announcement that they have the medium type.—Editors.]

On account of the recent importations of Corriedale sheep to this country from New Zealand, breeders have organized the American Corriedale Association. It is understood that the new association will maintain a flock book for all sheep of this breed tracing to Corriedale flocks recognized by the Sheep Breeders' Ass'n of New Zealand.

Raise the Horse That is Wanted.

There is no doubt but that the army horse buyers who have been active in all horse markets of the country have been discriminating buyers, and horse dealers in California maintain that instead of taking the culls, these buyers have taken only the best.

According to Carl N. Kennedy of the Oregon Agricultural College the condition in Oregon is worse than in California because the small, inferior horses which should have been sold are now on hand for the foundation of future herds. While we have many good mares on the farms of this State, his comments on the situation there are equally applicable here.

He says that many people are asking what is to be done to improve these horses so that those who are in the business at the present time may stay in it and derive a satisfactory income from their investments. The very first thing that will have to be done before advance is made is to replace the scrub stallion with a good pure bred stallion just as fast as it is possible.

In the next place these stallions must be given better care and more feed during the winter.

With sires such as are being used at the present time it cannot be expected that horses will be improved, since the sires themselves would scarcely make marketable geldings. We cannot get good, big, marketable horses from small, under-sized scrub stallions As long as we use mongrel sires we will raise a class of horses which will not only be hard to sell at a profit but hard to sell at any price.

With the advent of the auto and other forms of gas power times are changing and there is not now the demand and use for certain kinds of light horses that there has been in the past. To meet these changed conditions horsemen must change their method of breeding and raise what the market calls for.

WHAT FEEDS FOR COWS ON 10 ACRES.

To the Editor: As I am new in California and starting a dairy on ten acres, would like to know what crops would be best for me to plant. I would like to raise as much of my feed as possible. Would also like to know a good ration for a milk cow. —J. A. A., Merced.

[Alfalfa is probably the best thing for you to grow on your ten acres, at least for the time being. Later you might use a small patch of your land each year for stock beets, as they would be valuable as a supplement to alfalfa hay and would also be valuable for rotation purposes, assuming of course that your soil is not too heavy, otherwise they might be hard to cultivate, but we have seen stock beets growing well in pretty hard ground. Of course many dairymen here feed nothing but alfalfa hay, but it is being more generally recognized that better results are obtained where other feeds are used in connection. Corn silage would be the thing for you if you had more land or could rent outside land. Dried beet pulp is also a good feed to use in connection with alfalfa hay. The best ration to use varies according to the price of the different feeds. Prof. Woll has answered several queries along this line in these columns recently which should be of help to you in that respect.—Editors.]

WILL BEETS FOR DAIRY PAY?

To the Editor: Will it pay to raise beets for stock around this part of the country? The soil is sandy. If so, when should I plant, and how should I cultivate?—A. A. F., Livingston.

[Beets are an excellent feed for stock as a supplement to alfalfa hay and will improve the physical condition of your land. Both the Long Red Mangel and the Yellow Tankards are good beets for stock feeding. You can plant any time now. Plant thinly in drills two and a half feet apart for horse cultivation, using about five pounds of seed to the acre. Cultivation should begin as soon as the rows can be seen and kept up, not only to conserve moisture but to keep the lower strata of soil reasonably loose so that the soil may be displaced by the expanding beet. Beets should be thinned when the seedlings are small, say from two to four leaves, standing eight to ten inches in the row, according to the soil. Beets can be grown for winter feeding by sowing early in the fall on irrigated land. They can be sown later in the fall and during the winter and make a crop by rainfall. Or they can be sown late in the winter for midsummer feeding, being kept growing by irrigation after the rains are over.—Editors.]

BOILER FOR 300 BOTTLE DAIRY.

To the Editor: Would a one and a half horse power vertical steam boiler supply enough steam to operate a single bottle washer and to sterilize about 300 bottles at a time in a sterilizing oven; all other utensils such as buckets, cans, etc., to be sterilized by live steam? Would the bottles that have been washed in water containing washing powder need to be rinsed or would steaming be sufficient?—H. F., San Luis Obispo.

[A 3-horse power boiler would be better for your purpose than a 1½-horse power, as the sterilizing oven and bottle washer would sometimes pull the water down in the smaller boiler; and the additional cost in the larger one would be slight. If you use washing powder in the water to wash the bottles, you should rinse them off after steaming.—Editors.]

SHEEP FOR RANCH USE.

About 130 sheep are kept entirely for ranch use by the Santa Margarita Land and Cattle Co. of San Luis Obispo county. They lamb January to March on natural grass pasture at the home ranch and run in the hills till grain stubble is ready for fall and winter grazing. There are four ranches under the same management, aggregating about 75,000 acres. E. W. Black is foreman for the Reese Estate which owns or leases these ranches. Purebred rams are used.

W. J. Hackett of Ceres and R. H. Hogg of Denair recently sold Jersey bulls to Nels Larson of Modesto.

SPRING TROUBLES WITH POULTRY.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

Several inquiries as to what ails the poultry now that the weather is improving call for some consideration. Fowls that have been properly sheltered and fed during the winter months should be so busy laying that they have no time to think of anything else. But those that have not been so favored are liable to several diseases in the early spring months.

In some localities a slight cold soon assumes the form of roup if it is not noticed right away. If one or several hens are noticed sneezing there should be no delay about it. The very first thing is to give a dose of physic in some form; one of the most convenient is a dose of Epsom salts, a tablespoonful to a gallon of water, taking all other water away from them. If this is not possible, give the salts in a small quantity of moist mash, seeing that it is evenly distributed. This "first aid" is often all that will be needed if caught in time, but to make sure give a dose of powdered sulphate of iron in a little moist mash the next morning, a tablespoonful of the powder to a dozen hens. This is a tonic, and being mineral, supplies the hen with a much needed element in the blood.

I don't like doctoring the drinking water, because in most cases it keeps the hens from drinking all they need and when they are not quite up to the mark they really need to drink more. Epsom salts is colorless and almost tasteless, so this can be done without harming the hens.

In case the cold has not been taken in time, and roup has gotten a hold, it is safer to send the case into hospital at once. Washing the eyes and nostrils with peroxide of hydrogen, giving nourishing food, and a pill made of red pepper and carbonate of iron, once a day will often put them on the right road; if they don't mend quickly with these simple remedies souse their heads in coal oil and give a good physic, following it up with good feed, soft warm mash is best, and a liberal dose of sulphate of iron, half a teaspoonful to a hen.

Birds sometimes carry diphtheria germs, dropping them among chickens that are feeding. This I know from experience, as I lost some good hens one spring where a flock of birds lighted to eat the remnants of the chickens' supper.

As this yard was some distance from the rest of my flock the disease was confined to that one yard. If the smell is recognized as diphtheria it is safer to kill and burn the fowl at once, as it is dangerous to attempt a cure.

Some hens will respond at once to a little tonic, and the very best is the cheapest, nature's own remedy—a grass run. Get the ailing birds out on the grass and they will soon pick up, providing you feed them right and keep them clean.

For all contagious diseases, for worms and many other chicken troubles, there is nothing that will give so much satisfaction for the least expense as a good spray pump and a few gallons of distillate. Where chickens have worms, you may give all the medicine you like, but if the worm eggs are left on dropping boards, floors, and feed boxes, they are again taken into the hens' system to create another batch of worms. Take the spray pump and distillate along and destroy the eggs and your hens will soon be free from worms, especially if you feed something to rid them of them.

Ration for Rabbits.—One of our subscribers asks how she can fatten rabbits? Feed them oats—or oatmeal—milk and bread, carrots or ground barley, but not alfalfa meal. That will never fatten rabbits. Rolled barley is not bad, but oats or oatmeal is much better, in fact it is the best fattener for rabbits.

CHICKENS SUPPORT ORANGE ORCHARD.

[Written for Pacific Rural Press.]

Fourteen dollars a day net from the eggs of 850 White Leghorn hens hatched last June and run in a 5-acre orange orchard, is the record of N. Wilson of Ontario for the week ending Feb. 5.

He bought a thousand baby chicks June 13, 1915, hatched from the eggs of selected Hoganized hens. They laid their first egg Nov. 26. There was a big daily increase until 10,235 eggs were laid in January. They laid 534 eggs Feb. 8 and 536 Feb. 9, so Mr. Wilson expected 15,000 eggs in Feb. The week ending Feb. 5 he sold 11 cases for $124.80 after express to Los Angeles was paid. The feed of whole gyp corn, and bran in self-feeders, and alfalfa hay costs $3 per day, so the net was $103.80 for seven days' eggs.

No roosters are kept, but Mr. Wilson realizes the value of his fowls and expects to get some of the best Hoganized roosters next summer. He will then raise enough of his own chickens to replace his flock every two or three years. He figures that with so much run and shade, the hens, which are so bright and vigorous now, should produce a large percentage of fertile eggs.

The orchard is fenced with square mesh woven wire six feet high around most of the place; less around the house. Only occasionally does a hen fly out. A cross fence divides it into halves.

Lumber for a chicken house was ordered after the chicks were ordered last summer and Mr. Wilson built the house himself before the chicks arrived, in the dividing fence so they could be turned into either half of the orchard. It is 12 feet wide and 196 feet long. About half of the house lengthwise is taken up by droppings boards close under four lines of roosts, high enough to clean without bending over. The boards were put in tight, so the floor of the house would all be available as scratching shed. Moist winter weather swelled and buckled the droppings boards so they will be loosened and covered with galvanized iron. A line of nests is hung under the front edge of the droppings boards. The nests open toward the back of the house so they will be somewhat dark. Their frontsides are composed of 6-inch boards 12 feet long hinged so they can be raised and the eggs reached from the front. Five dripping fountains supply fresh water, and alfalfa hay takes the place of greens. The lower leaves of the oranges are somewhat eaten off, but owing to cold, wet weather in blooming last spring but little fruit was set anyway. That was the primary reason that the chickens were gotten, to furnish an income.

"I know also that the hens will help support the orchard," says Mr. Wilson, "until I become too opulent to keep them any more."

MOTHER TURKEY KNOWS HOW.

To the Editor: I wonder if your readers care to hear my experience with turkeys here in the Moreno, Allesandro Valley, out on the Box Springs Grade? I find that if you wish "good luck" with turkeys let the mother turkey do the hatching and let her be free to go from the nest when she likes. Don't disturb her when hatching, for when the eggs have hatched she will get off when it is time.

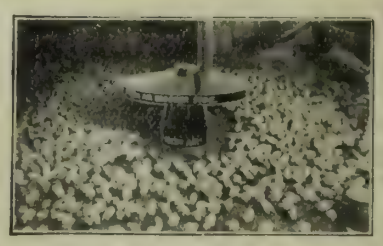
I feed very lightly with onions—green onions chopped—or with onions cut fine and well mixed with rolled oats. Maybe I give them a hard boiled egg at times. Don't bother with cooking bread for them, but if you have some stale crusts dip them in water, and then squeeze dry. For drink I give them just water.

There is no need to worry with the poults, for the mother turkey will look after them. I leave some weeds for them to run in for shelter. Be careful and don't put them in a dirty coop alive with vermin and don't forget the onions.

Mrs. Frances A. Greene.

POULTRY NEWS NOTES.

[By Geo. H. Croley.]



According to a report from A. Warren Robinson, Secretary of the Santa Cruz Poultry Association, the annual income that the members and associates of that association receive from eggs and poultry is over $500,000. One member reported a gross income for 1915 from 800 hens of $3,126.99, while another member with 340 hens on one acre of ground found in hand a cash dividend of $555.89 after providing for all expenses including taxes, insurance, and six per cent interest on his investment of $1500 in that portion of his property and equipment devoted exclusively to the poultry.

At a meeting of poultry keepers recently held in Petaluma, State Market Director Weinstock urged them to secure co-operation through the organization of a joint stock company. It was suggested that a share of stock valued at $25 should be held by each poultry keeper.

A little salt stops toe picking among brooder chicks. Put a level teaspoonful in one quart of their drinking water.

WHAT IS A FANCIER?

To the Editor: In reading poultry literature I notice reference to fanciers, breeders and keepers. Can you make it plain to me what, if any, difference there is in the meaning of these terms?—J. C., Stockton.

[Answered by Geo. H. Croley.]

[A simon-pure fancier is a person who breeds fowls or other domestic animals solely for the pleasure that may be obtained by successfully improving them in beauty and usefulness. He is sometimes referred to as an amateur breeder. A true fancier never expects to make money by his work and study, and many who have means and are independent also aim to expend a certain or an indefinite sum of money in addition to their efforts, simply from public welfare motives. A breeder is one who makes it a business to produce desirable fowls or animals for sale to others who may require them, usually for breeding purposes, or for use in other directions, for instance, horses for driving or teaming, shepherd dogs, etc.

A keeper is one whose business is the production or keeping of fowls or animals for utility purposes to supply his own wants or for sale in the general market. It is this class that supports the breeder and makes it profitable for him to devote time, money and special care to producing breeding stock that is superior to the general run of fowls and animals. Occasionally a bunch of breeders will get together and talk one another into the belief that they can ignore the wishes or demands of the great mass of poultry keepers, or keepers of other animals, but they soon learn that it will not work.]

BLACK SIBERIAN HARES.

To the Editor: I wish to know where Black Siberian Hares can be purchased.—B. C., Winters.

[Answered by Geo. H. Croley.]

[We have never seen any of this breed of hares on exhibition in California. They are rare and we doubt if any are to be had in California, but if any reader has them for sale let us hear from him.]

PRESERVING EGGS IN WATER-GLASS.

To the Editor: I wish to pack a large amount of eggs in water-glass. Can I get the silicate of soda and make the solution myself, and can you tell me how it is made?—H. H. P., Sebastopol.

[Answered by Geo. H. Croley.]

[The silicate of soda solution—water-glass syrup—is so readily obtained at moderate price, it is not economical to buy the flakes and prepare the liquid by dissolving them for the reason that the commercial solution, such as is sold by the stores, is the original form. It is usually produced as a by-product and is sold at a low price, whereas to produce the flakes, this solution must be put through an expensive process which makes it more costly than the solution. Some add ten or twelve gallons of water to this commercial solution or syrup to make the liquid in which the eggs are preserved, but the best results are to be had if only eight gallons of water are added to one gallon of syrup.

If you have a copy of "California Poultry Practice" turn to page 152 on which are complete directions for packing and handling eggs when this substance is used.]

SAVE ALFALFA LEAVES.

So harvest alfalfa as to conserve the leaves, if you want nutritious hay. Such is the moral pointed by Prof. M. E. Jaffa of the Division of Nutrition of the University of California. He says that a sample of alfalfa hay taken from a stack at the Stockton State Hospital shows 17 per cent protein. This percentage is about that which every sample of first-class alfalfa hay should yield, but many samples analyzed do not yield 10 per cent protein.

The difference between the protein the hay contains and what it should contain, is due to two main causes: the admixture of other hays, and carelessness in harvesting, bringing about a preponderance of stalks of the alfalfa with a minimum amount of leaf.

SALT LAKE ROUTE

BE SURE YOU'RE RIGHT

Then Go East.

Which is not quite what Davy Crockett once said, but it is applicable to our purpose to suggest that when you are considering which way you will go East, next time you go, you consult a Salt Lake Route ticket agent; 'tis a certainty that you will be right if you go East that way and that you will be thoroughly pleased with the excellent service of that line, with its three daily trains through to Chicago and other points via Salt Lake City.

Any ticket agent will be very glad to furnish full information.

if you have occasion to do business with an Express Company Remember The American Express operates over this route with best of service

MAMMOTH BRONZE TURKEY EGGS from selected stock. Also young Toms. M. M. Reiman, Pianada, Cal.

PHEASANTS—Golden and Ringneck. Eggs from April on. T. D. Morris, Agua Caliente, Cal.

FOR SALE—Thoroughbred Rouen Duck Eggs, $1.50 per dozen. Mrs. Emma V. Miller, Farmington, Cal.

The Home Circle Page of the Pacific Rural Press

MRS. BEST'S BULLETIN.

My dear Friends: I have to utter a piercing caution against the boot with the fur around the tops. Shun, oh shun, the boot with the fashionable fur around the coquettish tops. For why? For why, indeed. Don't I hear from Oklahoma City that the staid matrons of that not too mollycoddle town went to the city fathers to complain of flirting on the streets, and declared for one thing that fur-topped bootes incited it? And don't I hear from Winsted, Conn., that an unsuspecting young lady wearing footgear embellished with fur had a cat jump at it and gnaw it for a mouse? Such are some dangers that lurk in styles.

A riot of spring blouses in Georgette crepe and the heralded high colors has struck the metropoli on the Pacific. One can have a very decent selection for $5 in plain ones. Those with frilled and flowing lapels are coming into evidence, however. They are particularly chic in stripes.

New things in sweater coats of knit silk are to be discerned with the lining of different color, giving the outer surface a changeable effect. Loose sashes are used with them. A very few of these sweater coats are fringe trimmed. A stunner was a wine-colored one with a wide band of black fur trimmed at cuffs and skirt.

Full-skirted silken sport coats in subdued plaids of grayish or sepia tones are being introduced; they have sashes of the some material and sometimes side buckles.

Sport skirts, with yokes or without, are in solid colors, very vivid. When worn with blouses of a different color, as is recommended, the result is enough to fix every eye within a mile. One such skirt is of crimson with wide white trimming.

About the neatest thing in headgear, to my taste, is a plain black hat of fine straw, brim turned down, and trimmed with a 5-inch width of mouse gray Italian silk with a high upstanding bow of severe plainness. Yet the effect is bewitching instead of severe. This "lid" was $5.95.

You can get the new shades of rose-colored silks in double widths at $1 to $2 a yard.

Hist! they have black underwear now, in the everlasting Georgette crepe and Chantilly lace. This is to wear with the black blouse or gown.

Not only have they white gloves with black stitching but some have a zigzag bar of black around the wrist, which insures these gloves being distinguished from any others.

Some heavy plain scrim for curtains in 40-inch widths went this week at 12½ cents a yard. Figured scrim, in narrower sizes, was priced the same.

Having purchased some I will now draw the curtain until the week rolls by. Devotedly,

Rosabella Best.

THIS WEEK'S BEST HOUSEHOLD HELP.

To make a serviceable furniture polish—Equal parts of turpentine, linseed oil and vinegar; mix this together in a bottle and apply with a soft rag.

PUFF PASTE, OR PASTRY DOUGH.

(This Week's Preferred Recipe.)

Puff paste is made without leavening of any sort. Flour that has much gluten in it will give best results. One pound sifted flour with about one teasp. powdered sugar; the yolk of one egg beaten is to be poured into a place hollowed out in this flour, and the whole worked into a firm paste, adding water as necessary. Divide three-fourths pound of cold, hard butter into three parts, roll out the paste, put one part of the butter on half of it, fold over the other half and roll out; then treat it with another part of the butter, roll out; and then use the last part of butter. Then fold over again several times and roll out. The idea is to have alternate layers of butter and dough as thin as sheets of paper if possible. It is best to put it on ice or let it cool as often as it seems to become sticky while rolling, until the dough is firm. It can hardly be rolled too often. This dough will keep in a cool place several days. It is the basis for all sorts of pastries, tarts, etc. If properly made, paste of this sort one-quarter inch thick will raise to an inch in thickness when baked. To make it stick when folded over into tarts, brush the edges with egg yolk.

PRAISES "RURAL" RECIPE FIFTEEN YEARS OLD.

This item belongs in the Experience Exchange, but it is of so gratifying a nature that the temptation is irresistible to make much of it. There comes from Route 2, Box 45, Sebastopol, Cal., a recipe for sponge gingerbread with the enthusiastic comment by the contributor that she saw it 15 or more years ago in the Rural Press and has used it ever since and it is excellent. And here is that recipe, which sounds as good as it should taste:

One cup sour milk, one cup molasses, ½ cup sugar, 1 heaping tablesp. lard or other shortening, 1 teasp. baking soda, 1 egg, salt to taste, one tablesp. ground ginger and two cups of flour. Cream the sugar and shortening, add the egg and then the molasses, then the sour milk. Into this sift the flour, to which has been added the salt, soda and ginger. Bake in shallow pans.

EXPERIENCE EXCHANGE.

Mrs. A. M. S., of Berkeley, Cal., sends in this tried and enthusiastically recommended lotion to keep the hands soft and white: Mix equal quantities of vinegar and glycerine. This should be kept in a bottle handy to the day's work, and applied to the hands once or twice daily.

Several members of our audience were able to supply the long-buried words of "The Gipsy's Warning." We have to thank particularly Mrs. Cecil F., of Fowler, Mrs. J. C. B. of Sebastopol, and H. E. G. of Morgan Hill. Remarkable was the exactness with which the writers remembered the lines, with no copy at hand. Something about the tenacity of the memory for verses is referred to on today's miscellany page opposite. It was significant that the lines most unerringly recalled in the "Gipsy's Warning" were the more dramatic ones. Who knows the author or anything of the history of these verses?

DON'T LET THE CHILDREN—

Bite their fingernails.
Lick stamps or envelopes.
Taste samples of medicines
Suck slate pencils or lead pencils.
Pick up trash on the street.
Play with strange dogs or cats.
Play with matches, oils or fire.

CLEANING GLOVES.

It is a simple enough process to clean kid gloves, except for the one danger of fire. Do it in day time and away from any flame. Use about half a pint of gasoline in the bottom of a deep bowl. Soak the gloves in it till wet through, then place on a clean board and with a brush, sponge or cloth rub them from the wrist to the finger tips, one way only, and rinse in the gasoline. Renew the gasoline if it becomes very dirty. When the gloves are clean wring them out and hang them in the sun to dry. A slender round stick should be kept handy to fit the fingers over before the gloves become quite dry, or the gloves may be drawn on the hand to shape them. As a finishing touch polish the gloves with white French chalk and a piece of flannel.

OLIVE OIL FOR THE HAIR.

For people with harsh, dry hair, a weekly application of a small quantity of olive oil—enough for it to take up without seeming greasy—is recommended.

Hair has a natural oil which becomes exhausted through abuse of the hair. Olive oil replaces this when applied, and keeps the hair from becoming brittle, and keeps down dandruff—the latter through keeping the skin of the scalp in more normal condition. The hair of men, because shorter and cut oftener and too dry from wearing the hat too much, is particularly benefited by the judicious application of olive oil.

The ancients of Biblical times had a useful purpose when they "anointed their heads with oil."

THE OLD MAN ON THE CRACKER BOX SAYS:

By Fred Schaefer.

Kind hearts are more than coronets, but scarcely as numerous.

If a woman has a red nose she can blame it on corsets; but nobody would believe any excuse a man could invent.

In an argument as soon as the other fellow tries to be fair and concedes something, you flatter yourself you've got him whipped.

I know of people who periodically bring out their family skeleton and polish it like they do their silverware.

FIRST AID TO GARDENING.

Now is when one has the flower fever. And it is the right time, too. For the year's success in the garden depends hugely upon what is done right now.

With the pause in the rains the grass has romped, and this in the garden means weeds. On hillsides the ground was favorable for working a week after the downpour ceased, but on the level except in sandy porous soils, one had to wait a little longer. But the idea remains to tackle the plot at the first sign of freedom in working it and turn it over to bury the shoots of grass and unsprouted seeds. If the grass is too long an end of it will stick out of the upturned soil, and get air and live. It is not a bad thing to take a lawn mower to your weed bed, if it has run away with you, and cut it short before turning over the soil.

But at any rate get your garden into good tilth, both for the sake of the annuals and other things that you are going to plant. The rain you get from now on isn't likely to undo much of your labor.

Of course all kinds of seeds can be sown in the open ground and do well enough if attended to. But changes in the weather often discourage that. To make a sure thing of it start your little plants in flats and transplant them in your garden when the time is just right. A flat is a shallow box of a size easily to be handled when filled with earth, and has a few holes in the bottom for drainage. The professional size for a flat is 18 inches by two feet, and four inches deep. This should have very light and not too rich soil. Sand and leaf mold mixed is best. Leaf mold is the very best thing to use with the sand, as leaf mold, even by itself, will never harden to strangle the tender roots of a seedling.

The seeds should be started in these flats until they have three or four leaves, and then transplanted into flats containing soil that is stronger, say a mixture of loam and leaf mold. In this they will become sturdy and may be set out in a condition to keep right on growing.

The use of flats is very convenient, as you may have them under shelter and under your eye, so that there is every facility to water them and "fuss" with them. And you will be sure that the weeds won't rise up over night and choke them.

And then the fun of transplanting the seedlings is something that can be more deliciously felt than described.

DOMESTIC SCIENCE LIKED.

Seemingly domestic science is coming gradually into its own. It is dawning upon people that there is really something to study and know about the correct conduct of a household. It is announced in this connection that the correspondence courses in domestic science given by the University of California are increasingly popular.

The largest enrollment is in the course for the selection of foods.

THE SANDHILL CRANE.

By Mary Austin.

Whenever the days are cool and clear,
The sandhill crane goes walking
Across the fields by the flashing weir,
Slowly, solemnly stalking.
The little frogs in the tules hear
And jump for their lives when he comes near,
The fishes scuttle away in fear,
When the sandhill crane goes walking.

The field folk know if he comes their way,
Slowly, solemnly stalking;
There is danger and death in the least delay,
When the sandhill crane goes walking.
The chipmunks hide in their holes away,
The gophers stop in the midst of their play,
And "Hush! O hush!" the field mice say,
When the sandhill crane goes walking.

LOVE VS. HATE.

By Charles Grant Miller.

You may search the whole world of philosophy through and find no truer truth than this—that hate, pride, jealousy, revenge, malice, and all the other evil passions the heart is heir to work their first and worst injury to their possessor; they corrode, render wretched and destroy the heart in which they originate.

The one you hate and plot against may not know or care. If he gives any thought to your attitude it may be only to return our hatred. Is it worth while to steep our soul in poison for no better result than this?

We must expend much of our life forces on others. Is it not better to expend them in kindness that uplifts than in spite that debases?

Is it wise to sulk gloomily in the bogs of spite, when a step will take you out into the genial sunshine of kindness?

Is it sensible to dwarf your soul in efforts to make some one recognize that you are his enemy and can hurt him, when you can ennoble yourself by the lesser effort necessary to make him see that you are his friend and can help him?

What we give we get back in kind. Is it better to have the respect of others than their hatred?

Yes, your own feeling is reflected back to you from others. If you give love you get love.

Love is one of the things the more of which you give the more you have.

Love is born a twin and cannot exist without its counterpart.

The human heart, like the rose, only as it opens to the sunshine generates fragrance that sweetens its atmosphere.

It is your own attitude—your own thought—that attracts or repels others. According as you love or hate, you surround yourself with an atmosphere of inviting sweetness or you hedge yourself in thorns, with worms working where roses should bloom.

People are lovely to you or hateful, just as you love them or hate them. This is not mere seeming, but actuality.

Love is the light in which we see and live.

Hates are malarial mists in which we blindly grope and miserably die. —Christian Herald.

POETRY THAT LIVES.

Two middle-aged persons were looking over the literary stuff in their minds the other evening. They found that which they possessed most securely had been read years before. They could repeat with approximate accuracy passages of Shakespeare, Milton, Shelley or Tennyson which perhaps they had not looked at in twenty years. Of poetry read later hardly a line remained.

The reason, of course, was that when they were young and took it seriously they memorized what seemed most striking in the verse they read. In later lazy years they dropped the habit. For a person of normal retentive powers the habit of memorizing poetry is easily formed. Unfortunately it is as easily lost. It is doubtful if verse is much worth reading unless the most striking thing about it is worth memorizing. Otherwise it is no distinct feature of the mind, but only a vague object in the general fog. There is not much use in looking at a picture or a statue unless afterward one can recall at least what is most striking about it.

Probably young Webster, with only a few books, learning the Psalms and other parts of the Bible by heart, was really doing better for his mind than if he had been browsing through a library that left few clear thoughts and images. We say, memorize your poetry when you are young. Probably you will be too lazy to do it afterward. — Saturday Evening Post.

A CHINESE "DEVIL SHRINE."

Rev. Wm. C. Kerr of Chai Ryung, China, sends this incident from his itinerating experiences: "As I was entering Samsang, I saw a great assemblage on one of the hills in front of a little devil shrine. I found it was an annual meeting to do honor to their Satanic majesties, and I entered the low dingy building to find people bowing before crude water-colored pictures, intended to show forth the devils in all their hideousness, and praying for blessings during the coming year. As they left the enclosure, they would throw fragments of bread and cakes around on the ground to appease the unseen denizens of the place. But those same spirits are fast losing their influence, for it was only a few years ago that the worshipers met by the thousands; now only a few hundred appear, and the assemblage seems more like the average crowd on fair day than like a meeting for worship."—Christian Herald.

Pacific Rural Press Market Report

PRICES QUOTED AS PAID TO PRODUCERS.

San Francisco, Mar. 1, 1916.

WHEAT.

War developments caused an abrupt drop in the East a few days ago, but the market is picking up again. Locally, however, all grades are still lower than last week.

Northern Club	Nominal
none offered.	
Cal. Club, ctl. $1.70	@1.75
Northern Bluestem. 1.85	@1.90
Northern club is nominal here, with	
Northern Red 1.85	@1.95

BARLEY.

The speculative barley market has been decidedly active of late, with more firmness in prices. This has not affected the spot market materially, business being on a rather limited scale, with prices steadily held.

Shipping, ctl. $1.40	@1.42½
Choice Feed, ctl ... 1.32½	@1.35

OATS.

Nothing of much interest is transpiring in this grain, the local demand being of about the usual small proportions, while supplies are ample for all current needs and values are steady.

Red Feed $1.35	@1.37½
Red Seed 1.45	@1.65
White 1.50	@1.55

CORN.

Offerings of California yellow in marketable shape continue very light, while Eastern yellow moves fairly well at the old prices. Egyptian, etc., are in good demand, desirable lots finding ready sale at the range quoted.

Eastern yellow, ctl. ...$1.80	@1.85
Milo Maize 1.40	@1.45
Kaffir 1.65	@1.70
Egyptian 1.50	@1.55

BEANS.

The general market in this line shows a little more steadiness than for some time past, as it is expected that the Eastern demand will be more active from now on. The only quotable decline this week is on limas, which have been moving slowly for some time; while the scarcity of small whites is again having its effect, and this grade has been marked up a little. Other lines hold about steady at the old figures, with no definite indication as to whether prices will advance or recede still further. The usual large shipments of Manchurian beans are now coming in, most of them going out again to other markets.

(On wharf, San Francisco.)

Bayos, per ctl. $4.70	@4.80
Blackeyes 3.40	@3.50
Cranberry Beans 4.75	@4.85
Horse Beans 3.25	@3.50
Small Whites (south .. 5.60	@5.70
Large Whites 5.75	@5.90

Limas (south) 4.30	@4.40
Red Kidney 6.50	@6.75
Mexican Reds 4.50	@4.65
Tepary Beans	4.00

SEEDS.

Alfalfa has been marked up, as offerings of desirable quality are getting scarce, and there is quite a strong demand for spring planting.

Alfalfa, per lb. 21	@22 c
Melilotus Alba	6 c
Melilotus Indica	6 c
Bur Clover	11 c
Oregon Vetch ..... 4¼ @	4½c
Soy Beans	6 c
Canada Peas ..... 5¼ @	6 c
Sudan Grass	40 c

RICE.

Quite a lot of sales have been made recently in the Butte county district, at prices varying from $2.05 per ctl. for seed down to $1.60 for the poorest. Some of the mills report good sales, and with the railroad embargo on Eastern shipments lifted, a larger movement is expected. The Southern market is reported stronger.

HAY.

Arrivals have been rather excessive this week, which is attributed to a sudden easing of the car situation. This has weakened the local market a little, but prices are not quotably lower and lighter receipts are expected from now on, as stocks in the country are getting very small. Local trading has been more active than for some time; and while interior business is decreasing as the green feed becomes more plentiful, there is still a fair outside movement. Alfalfa is somewhat easier, as a lot of Nevada stock that was held up by weather conditions is coming in.

No. 1 Wheat $13.00	@16.50
No. 2 ..... 12.00	@14.50
Tame Oats 12.00	@18.00

Rolled Barley 29.00	@30.00
Tankage	45.00
Rolled Oats 29.50	@31.00

VEGETABLES.

Cool weather has held back the asparagus a little, but the arrivals have been quite liberal since Tuesday, and prices are considerably lower, with off lots selling below quotations. Steadily increasing supplies are expected from now on. Rhubarb shows a wider range, southern stock being cheap, while choice Bay stock brings higher prices. Carload shipments will start East from Alameda county shortly. Several kinds of vegetables are now coming from Florida, including peppers, eggplant, tomatoes and beans, all of which are high. Lettuce has advanced sharply, while artichokes are much lower, with abundant offerings.

Cabbage, ctl. 50	@60 c
Cauliflower, doz. 50	@60 c
Sprouts, lb. 5	@ 6 c

POTATOES AND ONIONS.

Some Eastern demand for onions is reported from the river district, but supplies in storage are getting pretty closely cleaned up, and prices are firmly held. No Australian stock has yet appeared, and Bermudas find a fair demand. The range on Oregon potatoes has narrowed down a little, with the top figure lower.

(On Wharf.)

Oregon Burbanks $1.75	@2.00

BUTTER.

Supplies have been steadily increasing for the last week, causing a gradual drop in prices, amounting to 8½c on extras. This is attributed in part to uncertainty regarding the new storage law, on account of which many who usually buy for storage are now holding off. The law requires that all butter sold after Oct. 1, if not from cows that have passed the tuberculin test, must be pasteurized.

	Thu.	Fri	Sat.	Mon.	Tu.	Wed.
Extras	31½	31	28	25	24	23
Prime Firsts	30	30	27	24½	23½	22½
Firsts	29½	29½	26½	24	23	22

EGGS.

Both grades have again declined, owing to the usual seasonable increase of production, and so far storage operators have not given enough support to stiffen up the market. It is believed, however, that prices have about reached the bottom. The new ruling that hereafter interstate shipments of eggs must be 95 per cent good has little effect on producers, nor does it apply with much effect to shipments from California north, which commonly consist of the higher grades. It merely means that eggs shipped, for instance, from the East to California, must be recandled before shipment.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extras	19½	19½	19½	19	18½	18½
Sel. Pullets	17½	18	18	17	16½	16½

CHEESE.

Flats are a little easier, but offerings are still limited, and all other grades are firmly held at the old prices.

DECIDUOUS FRUITS.

Storage operators who expected an advance have been disappointed, and there is now little prospect of better values, though stocks are expected to clean up fairly well. Local business is quiet, but there is some demand from the interior.

Apples:

Pearmain	.85 @1.25
Baldwin	.75 @1.25
Oregon Spitzenbergs..	1.50 @2.50
Jonathan	1.25 @1.75

DRIED FRUITS.

Dried fruit interests are greatly agitated over the report that England intends to put an embargo on the importation of dried fruits, which would shut off one of the most important outlets for the California product. While no official advices have been received from England, there is little doubt that some such measure is contemplated for the near future, and efforts are being made to oppose it. Under the present uncertainty packers and large handlers are buying only for actual requirements. Export shipments are being rushed, but it is said that no additional stocks are being bought for the purpose, as rail conditions are so uncertain that the proposed rule might take effect before the shipments reached the Atlantic. There is danger, also, that the ruling will demoralize the market for the new crop, and little contracting is likely until the matter takes definite shape. As for the spot situation, apples are unchanged and quiet, with very little demand anywhere and fair supplies still held here. The recent quotations on apricots were rather extreme, and have been reduced slightly, though the market is firm with light offerings. Figs are closely cleaned up, and both black and white are higher. Prunes are still moving fairly well on small orders, and the stock left in the country would not be heavy under ordinary conditions; but if the English market is cut off there may be a carryover. Values, however, remain fairly steady at the recent decline. Notwithstanding the prospect that the new peach crop will be closely controlled, this fruit receives scarcely any attention, and prices are still lower. Most growers, however, refuse to sell at the prices now quoted, and there is no very large stock on hand. The New York Journal of Commerce says:

"California raisins are dull though prices continue to be held, with a very firm tendency. The foreign inquiry for Coast stock is still felt in several quarters, and additional buying is said to be expected in a short time.

"Coast prunes are firmer and the unsettled tendency which was so prominent a few days ago has apparently entirely disappeared from the market, with the elimination of the small California packer. There is no indication that prices could be shaded, the quotations offered remaining steady and showing practically no change from the ones that were in evidence the early part of the week. Spot stocks are moderate and conditions generally quiet.

"Peaches are a trifle easier in some quarters on the Coast. Apricots show no change with little interest displayed either on spot or on the Coast."

Apples 6	@6½c

CITRUS FRUITS.

Eastern prices are off on California oranges, caused by too much fruit shipped early last month, and poor keeping quality of some of it. However, as shipments have been curtailed for the past ten days, it is thought that the market will soon right itself.

At New York on Monday, Feb. 28th, oranges on the auctions averaged from 95 cents to $2.95 per box, and lemons averaged $2.15 to $2.80. On the same day at Chicago the prices averaged for navels from $2 to $2.65 and lemons from $2.75 to $3.25 per box. Shipments from southern California up to Feb. 28th were 7,491 cars, as against 8,356 cars to same date last season.

Oranges are moving fairly well in the San Francisco market and for shipment to nearby points, with prices pretty firmly held. Grapefruit shows quite a wide range of prices, according to quality. The demand is moderate at present.

(Wholesale prices, San Francisco.)

Oranges, Navels $1.75	@2.75

HORSES.

More horses have appeared on the San Francisco market this week than for some time previous, and while there were no very notable offerings, some of the dealers have shown a fair assortment. Values on the whole are well maintained, especially on the heavier weights. Local buyers, though not especially eager, show a little more interest, and there is a very fair demand from some parts of the country.

Publisher's Department

While the rains interfered somewhat with field subscription work last week, yet we added 177 new subscribers to our list. We anticipate bigger gains from now on as the better weather season approaches.

Next week we expect to devote considerable space to silos and silage, in which subject we know there is a keen interest by stockmen in all parts of the State.

Have you sent for a copy of our new book, "Second Thousand Questions in California Agriculture Answered"? You need this book in your farm work.

We print this week the first half of an article by Albert F. Etter on his work with strawberries—the rest will follow next week. Many of our subscribers secured plants, through this office, of Ettersburg No. 80, and all of them will, we feel sure, be glad to read of the advance made in the work by Mr. Etter.

MISCELLANEOUS NOTES.

The Hughson Condensed Milk Co. will shortly have butter making machinery in operation.

The date of the Alameda County Fair has been tentatively set for two weeks after the State Fair at Sacramento next September.

There has been considerable activity in hop sales the past week, one report stating that 100 bales had been sold in Sonoma county for 13 cents and another saying that 15 carloads are being shipped from Wheatland.

Heavy shipments of green peas will be made in the next two weeks from Brawley, according to advices received from there. The cold weather has held back the crop some but not enough to be of any consequence.

Figures given out in San Joaquin county state that there are 6,000 acres of land signed up for sugar beets in that county this year. Results from last year's planting were satisfactory, which accounts for the increased acreage.

A considerable loss of lambs was reported around Dixon, Solano county, during the recent heavy storms. Those who had their flocks in the hills found it difficult to secure feed on account of the heavy snow and many losses were experienced on account of coyotes.

N. O. Brown, who was employed by Osborn and Son of Soda Springs, Idaho, has located near Turlock, Stanislaus county, with 77 head of purebred Shropshires, purchased from the Knollin and Finch flock. Mr. Brown expects to devote all of his time to his Shropshire flock, being thoroughly experienced in the handling of purebred flocks.

Following are the acreages of bearing fruits in California as compiled by George P. Weldon, Deputy State Horticultural Commissioner: Apples, 38,410 bearing, 22,430 non-bearing; apricots, 40,898, 14,553; berries, 10,468, 112; cherries, 8,269, 4,193; figs, 5,709, 2,413; lemons, 18,422, 18,228; oranges, 112,926, 55,527; olives, 15,642, 11,574; peaches, 113,725, 31,163; pears, 17,779, 19,649; plums, 16,410, 5,751; prunes, 91,470, 24,774; walnuts, 34,453, 20,362; almonds, 18,602, 15,473.

MISCELLANEOUS.

SAVE MONEY ON YOUR PUMPING PLANT—We are reducing our stock of Gas Engines, Oil Engines, Centrifugal Pumps, Friction Clutch Pulleys, etc., and can name you very low prices indeed. Write us at once. Commercial Iron Works, 481-497 Fifth St., San Francisco, Cal.

PRINTED STATIONERY—Hammermill bond letterheads, $2.50 per 1000; envelopes, $2.25; billheads, $2.50; business cards, $2.50; good work; sure to please you; mail order a specialty; samples free. G. C. Gallagher, the Service Printer, 309 Battery St., S. F.

MOGUL TRACTOR, 45 H. P.; used one season; fine condition; will demonstrate; have no use for it; will sell for half cost and give terms, or exchange for horses or mules. Drills, discs and other farm machinery for sale. Address W. H. Hord, 704 Market St., S. F.

EVERY SIZE WROUGHT IRON WATER PIPE and screw casing water pipe, guaranteed as good as new. Prices right. Send for catalogue. We beat no one; everybody gets a SQUARE DEAL. Weissbaum Pipe Works, 160 Eleventh Street, San Francisco.

SECOND-HAND WATER PIPE and Screw Casing. New threads and couplings dipped in hot asphaltum. All guaranteed. Send us your inquiry. SHECTER PIPE WORKS, 306-8 Howard St., San Francisco.

WILL SELL TOGETHER OR SEPARATELY—3 five-disc plows. Scarcely used, best made, none better for small or large tractor. Would consider good auto as part payment. P. O. Box 654, Burlingame.

"SMITHS' PAYS THE FREIGHT."—To reduce the high cost of living, send for our Wholesale to Consumer Catalog. SMITHS' CASH STORE, 106 Clay St., San Francisco.

BUY ROASTED COFFEE WHOLESALE—Best, 10 pounds $3.00 delivered. Order with remittance, WM. J. SCHROTH CO., 112-B Market St., San Francisco.

APPLES!—Buy direct from producer. Newtowns, 90c; Bulk pack, 4 and 4½ tiers, equal proportion. No 2 grade for cooking, 65c. Edwd. A. Hall, Watsonville, Cal.

LIVING EXPENSES REDUCED THROUGH CO-OPERATIVE BUYING—Write for catalogue and particulars. Pacific Co-operative League, D236 Commercial St., S. F.

PATENTS THAT PROTECT are procured through Pacific Coast Patent Agency, Savings and Loan Building, Stockton, California. Established fifty years.

GAS ENGINE—25 H. P. Fairbanks Morse Vertical. Guaranteed perfect. Bargain. J. J. Pottinger, 189 2nd St., San Francisco.

ASK FOR SNOW'S GRAFTING WAX—If your grocer does not have it, send to D. A. Snow, R. 3, Box 255, San Jose, Cal.

SEEDS AND BULBS.

SEND 10 CENTS for four packets seeds of the finest vegetables of their class, viz.: Detroit Dark Red Turnip beet, Early Snow Ball cauliflower, Copenhagen Market cabbage, Paris Golden Self-Blanching celery. Regular retail price for the whole is 40c, but to introduce, and for your name and address with 10c, I will send same with my catalogue by mail, postpaid. Charles Johnson, Seed Specialist, 1686 Shattuck Ave., Berkeley, Cal. Over 50 years in seed business; author "The Seed Grower," standard work on seed growing.

SUDAN GRASS SEED for sale by the grower, direct to farmer at a saving of 60 per cent—less than Seed dealer's prices! Choice seeds; none better. Send in your orders now while it lasts. Greatest forage crop known for dry or irrigated land. Better and finer hay than Timothy. **Wm. P. Spalding, R. F. D., No. 1, Box 64, Los Molinos, Cal.** 30c lb. in small lots; 50 lbs. and over at 25c, delivered.

PARIS GOLDEN SELF-BLANCHING CELERY SEED—Best French grown, new crop; the variety grown extensively for Eastern markets by California and Florida celery growers. $15 pound; $4 per ¼ pound; $1 ounce; 15c packet; by mail postpaid. Charles Johnson, Seed Specialist, 1686 Shattuck Ave., Berkeley, Cal., over 50 years in seed business; author "The Seed Grower."

SOUDAN GRASS SEED—Guaranteed absoutely free from Johnson grass seeds, 30c per pound for less than 10 pounds, 27½c per lb. for 10 to 49 pounds; 25c per pound for 50 pounds or more. I pay postage or freight. John Silbersack, San Martin, Cal.

CALIFORNIA GROWN SUDAN GRASS SEED—Absolutely free from Johnson Grass or other Weed seed. Plant all you can of it; for Broody Chicks and laying Hens or stock of any kind you can't beat it. 30 cents per lb. Write for prices on large lots. Lasher's Hatchery, Petaluma, Calif.

SEED BEANS—We have choice Red Mexican and Blackeyes grown on sandy land, producing a heavy crop. Well cleaned and in good order. Write for prices to THE GRANGE COMPANY, Modesto, California.

MELILOTUS ALBA OR SWEET CLOVER—Recleaned and good seed 20c f. o. b. Any quantity up to 2000 lbs. Samples sent on request. V. M. Shuey, Manzanar, Inyo Co., Cal.

SEEDS, PLANTS, BULBS—Nursery stock, baby chicks, poultry supplies and remedies, incubators, brooders and bee supplies. San Francisco Seed Co., 257-259 Market St, San Francisco

TREES AND PLANTS.

WALNUT TREES — Late blight-resisting varieties grafted and budded on California Black and on FIRST GENERATION Royal and Paradox Hybrid roots, which are as much superior to the California black root; as the California Black root is to the English root—Eureka, Franquette, Mayette, Neff's Prolific, Concord and Placentia. Dr. W. W. Fitzgerald, Elks' Building, Stockton, Cal.

CITRUS TREES—40,000 assorted—25c in tree row; 25c balled; subject to advance. All big, two-year-old stock. Choicest ever produced by anybody, anywhere, at any price. Lem A. Brunson, Santa Fe Springs Nursery. Office, 1120 Haas Building, Los Angeles, Cal.

FOR SALE—Manzanillo Olive Trees, budded on Picholine seedlings. Younger and heavier bearers, longer lived and more vigorous trees than trees raised from cuttings. Geo. E. Rice, R. 1, Box 76, Reedley, Cal.

FRANQUETTE AND MAYETTE grafted on California Black. Sizes 3 to 10 feet. Prices reasonable. Special discount on large orders. Sunset Nursery, 525 W. San Carlos St., San Jose, Cal.

WILLSON'S WONDER and genuine Franquette trees and grafting wood for sale. Write for circular and prices. Encinal Nurseries, F. C. Willson, Prop., Sunnyvale, Santa Clara County, Cal.

NURSERY STOCK—None better. 2-year-old Navels, Valencias and Lemons, ⅝ and up, 25c, balled or packed in moss. Ask for prices on carload lots. J. C. Johnson, Azusa, Cal.

FOR SALE OR EXCHANGE—1500 San Jose Mayette Grafted Walnuts. Six to ten feet. Price low or will exchange on light auto or good heavy team. Chas. Story, Rivera, Cal.

WALNUTS—Budded on California Black root; Franquette, Mayette, Concord, Eureka and other leading varieties. Extra fine stock. No better anywhere. Write for full particulars and prices. Woodbridge Walnut Nurseries, Motor Route B, Box 269, Modesto, Cal.

GRAFTED ENGLISH WALNUTS—A few hundred fine vigorous trees. Two-year-old California Black Walnut roots, one year Concord Walnut graft. Bishop Bros., San Ramon, Cal.

CITRUS, FIGS, PEACH AND APRICOT TREES—Also Thompson, Muscat, Emperor and Malaga rootings for sale at the Wood Ranch, two miles south of Del Rey. I. Takahashi.

SWEET POTATO PLANTS for April and May delivery. California Yams, $2.25 per thousand, 35c per hundred, prepaid. J. Braswell, R. D. No. 2, Lindsay, Cal.

FRUIT AND ORNAMENTAL TREES—Almond, Prunes and Pears. Berry plants. We contract to plant and care for orchards. Panama Nursery Co., Concord, Cal.

ACACIAS AND EUCALYPTUS—Most varieties, in cans, 3 feet up. Fine stock. Any quantity. Write for prices. Ekstein Nursery, Modesto, Cal.

TEPARY SEED BEANS—1915 grown. Fancy recleaned, 7c. lb. Order now; limited supply. Dean H. Potter, Shafter, Kern Co, Cal

SELECT LOCKEFORD BURBANK—Rural and American Wonder Seed Potatoes. $1.50 per 100. N. H. Locke Co., Lockeford, Cal.

WAGNER'S CRIMSON GIANT WINTER RHUBARB—Subdivided plants. 15 per 1000; $2 per 100. C. E. Shelford. Healdsburg.

CLOVIS NURSERY offer for sale all kinds of nursery stock at 2320 Tulare St., Fresno. K. S. Yamamura, owner.

FOR SALE—Orange trees from selected two-year-old stock. K. Matsuoka, one mile west of Sanger, Cal.

TEPARY BEANS FOR SALE—Eight cents per pound. Robert Paulsen, Lockewood, Cal.

FOR SALE—Spineless Cactus Plants. Prices right. R. C. Engbert, Byron, Cal.

PALM TREES—$1.00, $1.50, $2.00 f. o. b. Sunnyvale. F. B. Kraseman.

APPLES, PEACHES—10 cents. Gage Nursery, Corning, Cal.

WANTED.

WANTED—Responsible Representative. 12 tools in 1. Sell to farmers, teamsters, contractors, etc. Lifts 3 tons, hoists, stretches wire, pulls posts. Many other uses. Free sample to active agents. One agent's profit $45 in one day. Another $1000 in Dec. We start you. Write for Big Color Plate. Secure exclusive sale. HAKRAH MFG. CO., Box M, Bloomfield, Ind.

WANTED—About sixty young men and women to enter the Western Normal to prepare for teaching, or to secure a high school education in the shortest possible time. Western Normal graduates secure and hold good positions. Time and money saved. For information address Western Normal, J. R. Humphrey, Principal, Stockton Cal., Box 704.

RANCH FOREMAN, married, at present employed, desires to correspond with parties wanting a thoroughly competent, reliable man; agricultural training; experienced with purebred dairy and beef cattle, hogs, orchards; farm construction. Address, giving particulars, Box 209, Pacific Rural Press.

10 YEARS' EXPERIENCE—Get absolute results on any farming proposition. Open to position as superintendent or manager now. Wm. Curtis Clark, 1565 Madison St., Oakland. Phone Oak. 7533.

NURSERYMAN WANTS WORK—Pruning, grafting in orchard or nursery. Greenhouse work if required. Address Robert C. Morrison, care Box K, Auburn, Cal.

LAND FOR SALE.

FOR SALE OR EXCHANGE—Best little apple orchard in the famous Rogue River Valley, Southern Oregon, right in city of Ashland, 5,000 population. Average crop past ten years, 900 boxes Newtowns and Spitzenbergs, $1.25 per box. Last year's crop, 1,400 boxes, $1,700. Price, $7,000; equity, $5,000. Trade for stock or grain ranch, low altitude. O. H. Barnhill, owner, Ashland, Ore.

NEW OPENINGS—Enlarged Homesteads. Nearly TWO MILLION acres GOVERNMENT LAND, different counties, plainly marked on COUNTY SECTIONAL Maps, $2.50, any County. Booklet, map, circular FREE. STATE MAP, showing 600,000 acres of SCHOOL land opening over State, $2.50. Order TODAY. Checks taken. JOSEPH CLARK, Sacramento.

I OWN AND OFFER FOR SALE 475 acres of land situated in Solano Co. between Dixon and Winters. Good house and barns. About 80 acres graded for alfalfa. Good wells and irrigating pump. Adjoins the successful rice fields of this country. Price, $60.00 per acre. $10,500 cash and balance on easy terms. J. H. Peterson, Dixon, Cal.

FARMS WANTED—We have direct buyers. Don't pay commissions. Write describing property, naming lowest price. We help buyers locate desirable property Free. American Investment Association, 93 Palace Bldg., Minneapolis, Minn.

47 ACRES—2½ miles from University Farm, modern dairy and hog ranch. 30 head cattle, hogs, team, and everything complete. $2500 less than its value. Write owner for particulars. Box 36, Davis, Cal.

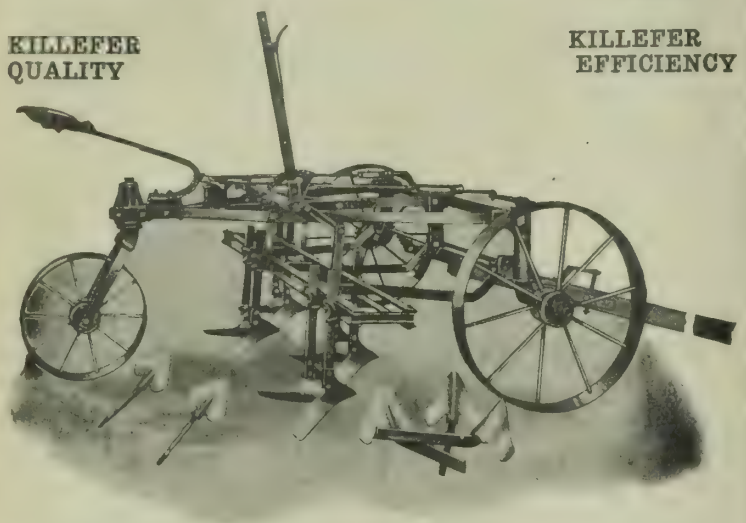
FOR SALE—Dairy ranch, half mile from Livingston, Merced county. Sixteen acres in alfalfa, 12 cows, 1 bull, heifers and hogs, horses and farm implements. Price, $4875. J. A. Wolf, Livingston, Cal.

IMPROVED RANCH of 170 acres for sale. Brown's Valley Irrigation District, half mile from school and post office. F. E. Snell, Brown's Valley, Yuba Co., Cal.

ALFALFA RANCH FOR SALE with buildings; either 50, 100, or 150 acres. Easy terms. $125 to $150 per acre. Alex T. Gibson, P. O. Box 361, Chico, Cal.

FOR SALE—8 acres Muscat vines, one-fourth mile from DEL REY. Netted owner last year $800. For price, enquire at Royal Vineyard. W. Tranberg.

FOR RENT—Irrigated fruit and vegetable ranch on shares. Splendid opportunity. Slater, owner, Hobart Bldg., San Francisco.



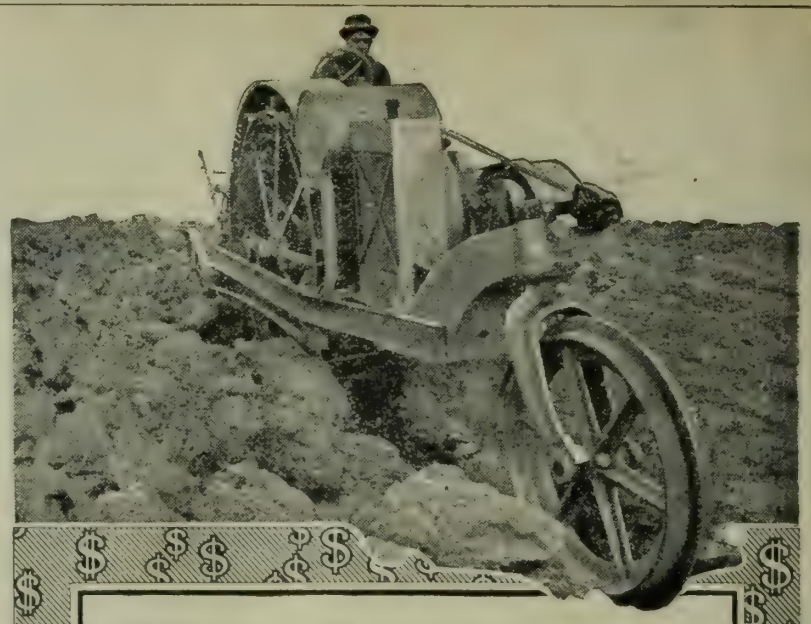
WANTED TO HEAR FROM OWNER of good farm for sale. Send description and cash price. R. C. List, Minneapolis, Minn.

WANTED GOOD FARM, or unimproved land from owner. H. L. Downing, 145 Palace Bldg., Minneapolis, Minn.

Beet Cultivator (K)

KILLEFER QUALITY

KILLEFER EFFICIENCY



The frame of this Cultivator is made of one continuous piece of high carbon steel with a truss connecting it to the main castings, supporting the two steering wheels. This construction makes a cultivator that is almost impossible to break down in the center and in consequence the wheels are always in line and under easy control.

The lower frame or tooth bar is from the same quality of steel with a strong arm at each end, which connects with the lifting rod, allowing no chance for the frame to dip or run deeper at the ends. The seat is set back far enough to give an unobstructed view of the rows. The foot control of the front wheels is adjustable with a turn-buckle for taking up wear, and is very easy on the operator. A lock is provided for the rear wheel that holds it rigidly in line except on the turns. This is the **strongest** and **best made** Beet Cultivator for sale on the Pacific Coast.

The Killefer Manufacturing Co.

2209-21 Santa Fe Ave. Los Angeles, Cal.

Within 12 inches of the fence---

That's how close you can plow with the **BIG BULL** tractor. It saves good ground for cultivation.

BIG BULL $645 f. o. b. Minneapolis

Turns a corner twice as rapidly as a horse. Plows as straight as an arrow.

"Jackson MADE"

Write for Catalog No. 47 F

A Better Make Not Made

For Water Deep Under The Ground

Jackson Deep Well Turbine Pumps give continuous and efficient service. They do not get out of order as they have no valves or plunger rods. Very little care or attention needed as they are oiled from the surface. Are much lower in cost than other types of deep well pumps when the expense of dug pits, cribbing and timbering is reckoned. They raise water from the very bottom of the well, thus eliminating heavy vacuums and delivering all the water the well yields. They develop slow wells and increase their flow.

Like all Jackson Made Pumps These Deep Well Turbine Pumps Are the Very Best Pumps Made for the Purpose—They are Dividend Earners, Not Expense Makers

Whatever your water problems may be our Expert Pumping Engineers will help you out free of charge—write

BYRON JACKSON IRON WORKS, Inc.

CALIFORNIA HOG BOOK

A very handsomely printed cloth-bound book of 256 pages of text, besides many plate engravings. Written by a scientifically practical swine man with years of experience back of him.

In the feeding chapter a number of California breeders give their methods of feeding for best results. Just what is needed for swine producers of the Coast. Send us $2 and the book will be mailed promptly.

Price, $2.00 Postpaid.

PACIFIC RURAL PRESS, Publishers

525 MARKET STREET, SAN FRANCISCO

California State Library

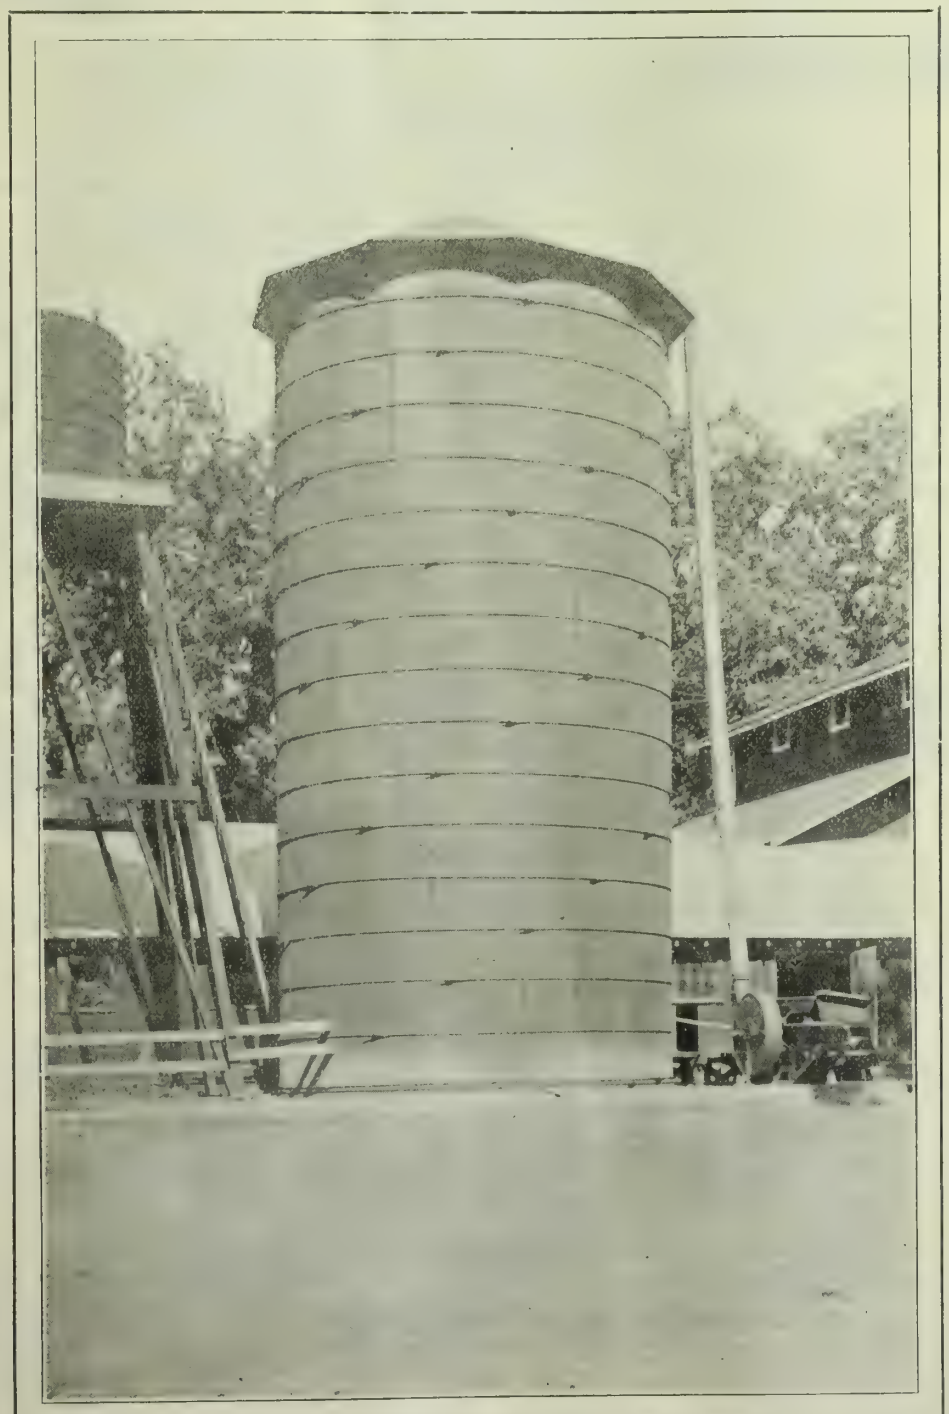
Vol. XCI—No. 11 Forty-sixth Year

THE PACIFIC RURAL PRESS

SAN FRANCISCO MARCH 11, 1916. LOS ANGELES

California's Silo History to Date.

Sidelights on the silo and use of silage from prominent dairymen that augur well for the advancement of alfalfa's most likely aid in balancing livestock rations.



[Written for Pacific Rural Press.]

FOUR years ago silo construction in California was mostly through the farm press. Today it is mostly in the country. Probably that is the strongest and most gratifying endorsement that could be made in favor of the silo.

While traveling through the largest dairy county in the State last fall the writer was told by responsible parties that there were over 200 silos on farms in that county at that time. Four years previous to that, in an attempt to tell Rural Press readers the exact status of the silo, he found silo owners so hard to locate in that same county that it was with considerable difficulty that he secured any detailed data for publication.

From Humboldt county on the north, noted for its green pastures of clover and its lack of corn growing possibilities, to Imperial on the south, with its extreme heat and almost total lack of rain, the silo has verily taken the stock growing districts of the State by storm.

True, it has been given publicity of a convincing nature, but its best advertiser has been Results. Its first appeal came from owners who had found silage of incalculable value as a supplement to alfalfa hay for dairy cattle. It next attracted attention for its almost uncanny ability of turning foul, weed-ridden first cutting alfalfa into palatable, nutritious feed. And lastly it commanded attention because it introduced summer crop rotation on alfalfa lands. This last is probably the most fundamental thing about the silo from an agricultural standpoint, as it is providing an agency for the restoration of the soil to its original fertility for alfalfa culture.

A Sonoma county silo that furnishes succulent feed in the dry seasons of the year when other green feed is scarce. Silos established a reputation there years ago, and some of the first ones erected are still in use.

While it is interesting to look backward for four years, it is equally as essential to look forward as far as we may, for there are thousands of farmers and stockmen who need a silo that do not now possess one.

In order that our readers who are included in those thousands may look forward to the silo through equally as intelligent eyes as those who have already put it into use, we give extracts of advice from leading dairymen and breeders in widely separated parts of the State.

Along the Coast.—From the Sunnybrook Ranch in Mendocino county, on a place where alfalfa growing has not been found practicable, H. H. Sisson has this to say: "The silo has given us succulent feed for our dairy stock all through the winter, summer and fall when there was no green feed available. When our silage gave out this spring, before grass was available, we noticed quite a drop in the milk—from two to six pounds per cow. The only disadvantage we have found is that the silo will get empty."

One of the oldest silo owners in Napa county is William Watt, owner of the Longwood Farm. He has two silos and in his own words "thinks the silo should be more extensively used in this State, not only for economical storage of corn and grain but for the independence gained by its use in winter and the saving in summer over feeding soiling crops. It takes less labor to fill your silo than it does to feed the same amount of alfalfa as green stuff. You also have the advantage of being able to cut your alfalfa when it is ready, and do not lose weight on that portion of the field cut too soon, and quality on that portion left for later feeding. I have changed my cows from green alfalfa in June, after filling my silos with vetch and barley, onto the fresh silage and have never been able to find a decrease in milk flow. In the fall I fill with corn

(Continued on page 336.)

MARKET OR HOGS FOR RICE?

To the Editor: I have some rice that I want to fatten pigs on. Will you tell me the feeding value of rice as compared to other grain, and can I get my money out of it by feeding to hogs with pork at six cents or had I better sell it for two cents a pound? —B. E. C., Wasco.

[Experiments carried on in the Southern States, where rice-feeding methods are better known than anywhere else, show that low-grade rough rice is worth 7 per cent more than corn as a hog feed. Theoretically, corn is worth 5 to 10 per cent more than barley as a hog food; but practically the former figure is more nearly correct.

Therefore, low-grade rough rice would only be worth about 12 per cent more than barley, or, at present about $1.50 per hundred. While good rice is no doubt worth more, we are led to believe you had better sell your rice at 2 cents and buy barley for your hogs.—Editors.]

Real silo profits come only from the silo that makes a high quality of silage—that preserves *perfectly* all crops placed within its walls.

For many years the recognized leader of **the silo world** has been the

Wm. Rowan, Bishop, Cal. "Silage has kept in perfect condition and cattle eat it with great relish."

Percy Stearns, Lebanon, Ore.—"I am well pleased with my Indiana Silo. Every stock farmer in the Valley should have one for it lessens the cost of raising a cow nearly one-third."

A. H. Bair, North Yakima, Wn.—"No more 2x4 silos for me. The "Indiana" is the best silo for the money I have ever seen."

INDIANA SILO

C. Leckband, Dayton, Ore.—"I am well pleased with my "Indiana" Silo, both as to structure and results obtained. By feeding silage as a dairy feed, I not only get good prices for my feed but am well repaid for my labor."

L. L. Ernst, St. Paul, Ore.—"I believe silage is the cheapest feed I can put up, besides taking up little space and being nice to handle and easy to get at. I will not use half the hay I have used other years. My Indiana silo has not leaked at all."

For many years to come it will still be the *standard* by which *all* silos are judged, for it has *built* into it all features necessary to the success of its work and the convenience to its user.

The farmer who gets paid most for his work is the one who "sells" his crops to his own use—fattens his livestock, increased his milk yield, reduces his feed bills, through the silo. Almost *sixty thousand* American farmers—successful ones—use the "Indiana" to increase the profits from their farms. Won't *you* profit by their *experience?*

Our new Silo Book—written with reference to the needs of the Pacific Coast—is a valuable addition to any farm library. *Your* copy will be sent free upon request. Use the coupon or send your name on a postal.

Pacific Rural Press

SAN FRANCISCO | SATURDAY, MARCH 11, 1916. | LOS ANGELES

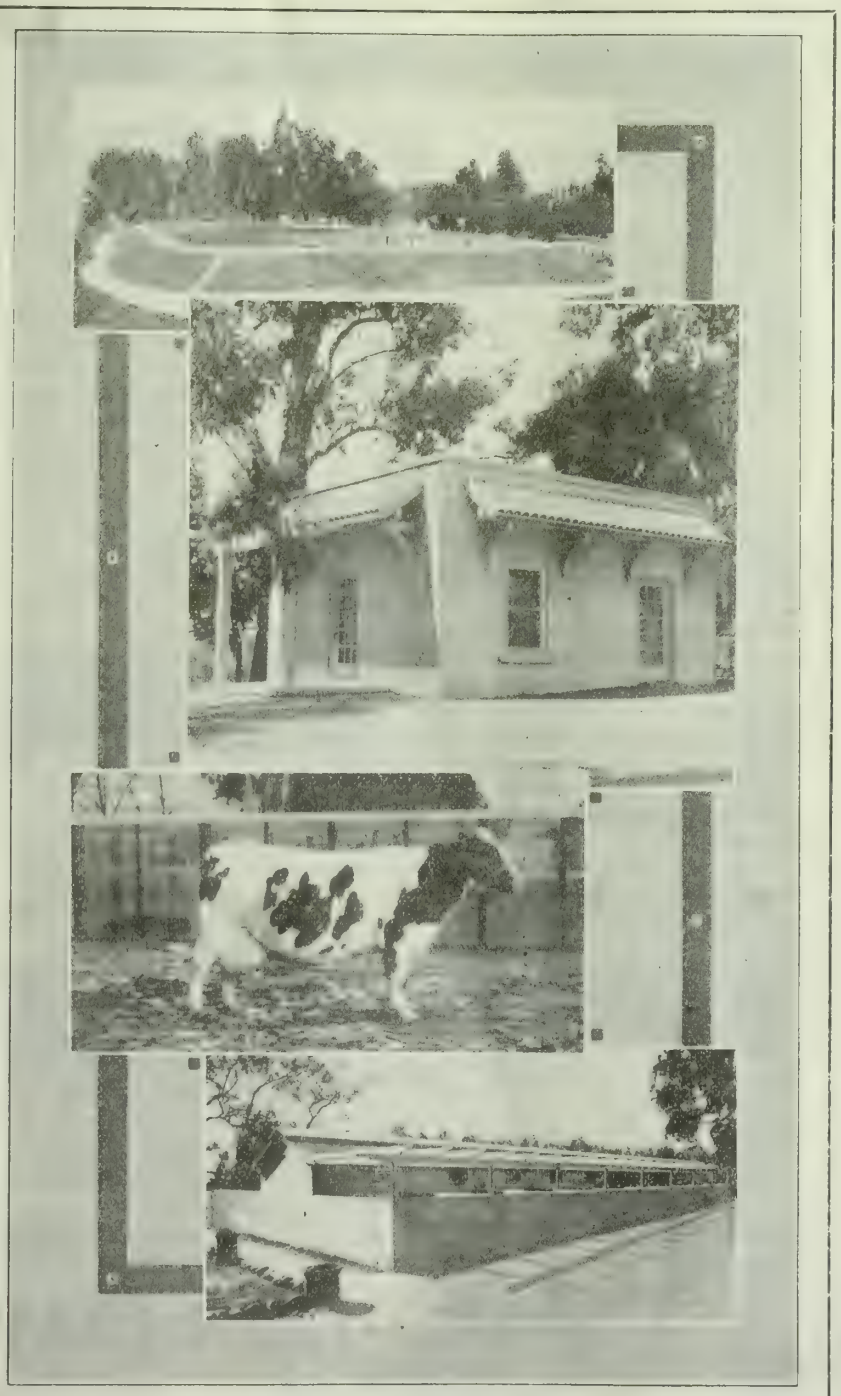
California's Big Purebred Establishment.

[The name of "Lucky" E. J. Baldwin is a historical one in California and it is appropriate that his love for fine livestock should be perpetuated in a befitting manner by his daughter, Mrs. Anita M. Baldwin, on a large scale as herein set forth.]

[Written for Pacific Rural Press.]

FIVE thousand purebred hogs and 500 purebred Holsteins would seem a big undertaking even for a California ranch, yet everything is being shaped for that goal on the Santa Anita Rancho in Los Angeles county, according to Supt. W. H. Taylor, who manages the ranch for Mrs. Anita M. Baldwin. This in addition to the purebred draft and light horses, jacks and jennets, dogs of several pure breeds, and fowl with ancestors, too.

Just now there are only about 100 brood sows, and three boars on the 3500-acre home ranch, besides two service bulls and 31 cows already milking, 75 or 80 brood mares, seven or eight stallions, a jack, two dozen jennets, about 500 peafowl, and the dogs, whose prices in many cases run over $1000 each.



As for the quality of this stock, it is possible for us to give only a few of the big names in the herds.

Kintyre Laird, the Berkshire boar, after winning many firsts and a championship in Washington, became Reserve Grand Champion at P. P. I. E. He cost $685 at the P. P. I. E. auction. The Reserve Grand Champion Poland China of the World's Fair was bought for this ranch for $1,000 from M. Bassett of Hanford. Eight of the sows won 51 ribbons at Washington, Oregon, and San Francisco last year.

One of the bulls is a son of the $10,000 Wisconsin Holstein De Kol Hengerveld Burke; and is out of a cow that averaged 110 pounds milk for seven days. Among the cows is Alba Sadie Cornucopia Creetia, which recently made an official record of 34.135 pounds butter from 505.4 pounds milk testing usually over 5 per cent and up to 5.6 per cent fat. The herd also includes daughters of Johanna King Segis, a $25,000 bull, De Kol the 2nd, Butterboy 3rd, Prince Goelsche Walker, De Kol Hengerveld Burke, King Segis, De Kol Mead, King of the Pontiacs, etc. The cows now in milk are averaging about 48 pounds, testing 3.5 per cent fat. They have already two 27-pound records, one 26, and one 18-pound senior yearling, though official tests have been conducted only since last December. Every cow is put on official test as soon as proper after freshening. The calves are expected to sell at about $400 average.

The registered jack, King Beersheba, has been champion of the jack-breeding State of Kentucky. The imported stallion, Jusque, weighing about a ton in his working clothes, heads a herd of 18 Percheron mares, among which is Manon, the senior champion Panama-Pacific Percheron mare, and she weighs close to a ton. the herd includes the first prize stallion and three mares of the P. P. I. E., and the best 10 mares in a class for which a large silver cup is displayed in the trophy building.

The ranch has bred four American Derby winners, one of which, Rey el Santa Anita, 25 years old, is pensioned off by the will of "Lucky" E. J. Baldwin, the founder of the estate. There are 20 registered thoroughbred mares and three stallions besides two beautiful Arabian stallions and two Arabian mares, in addition to other fancy light stock being raised now, not to race but to sell.

Scenes on the Santa Anita Rancho: 1. Reservoir. 2. Office. 3. Abba Sadie Cornucopia Creetia. 4. Hog House.

Some of the Feed.—To feed this stock, 400 acres of alfalfa have just been planted, 1600 acres of the finest hill pasture are available in another ranch, and 500 acres of Indian and sorghum corn will be planted. These are just some of the high spots. Carrots alone will occupy 25 acres; for last year's carrots, still being dug, are as big as sugar beets and turning out 12 to 15 tons per acre. Beet pulp and bran will also form an important part of the cow rations, while rolled oats, barley and bran will be included in the horses' rations, but not corn.

Flowing Wells.—To water the feed-growing part of the ranch as well as the 100 acres of potatoes, two or three hundred acres of oranges, and orchards which produced 250 tons each of fresh prunes and apricots last year and 600 tons of peaches, 16 wells are used. Flowing water is obtained at 200 feet. Some of them flow over 200 inches of water and the capacity can be increased by pumping. A 5,000,000 gallon reservoir 50 feet above the stables will furnish storage for part of the irrigation water, and pressure for fire-fighting and stable-cleaning.

Unit-Plan Concrete Building.—Concrete is being used for all livestock buildings and even for partitions between the bull pens. Gravel is found in abundance on the place. Tile roofing and broad tile eaves give a dash of color to the architecture, which is all to harmonize with the rest on a plan predetermined by Mrs. Baldwin and Mr. Taylor. Every building is designed on the unit plan so that, as the herds increase to the ultimate size, similar units can be added in every case, without crowding or disarrangement.

Official Test Building.—The most striking building, and the most important, is that in which are kept the cows on official test. It is concrete, with a double line of concrete-sided stalls, light and airy, and each opening into a moderate-sized paddock entirely enclosed with wire fly-screen. Flies will not worry the cows on test; neither will the cows suffer with heat by being blanketed.

(Continued on page 332.)

Discussing the Prune Outlook.

Many things growers should consider and get preparedness for before the buyers make their spring drive.

To the Editor: Acting on the suggestion of Mr. S. H. Shelley of San Jose in last week's Rural Press, I beg to submit a few remarks to the discussion on the prune outlook.

That with a possible big crop the coming season a wider market is required as well as better information, seems very true. The first great necessity, however, seems to be an effective state-wide organization of prune growers, working in harmony with all small organizations in existence, the whole under the supervision and guidance of State Market Director Weinstock. Neither better information nor a wider market nor any of the other necessary things can be accomplished without a strong organization.

Present Opportunity.—No greater opportunity was ever offered any body of men than Mr. Weinstock has presented to the fruit growers of this State by putting the tremendous power and prestige of the State of California at the disposal of the growers. While growers in other lines of fruit seem eager to take advantage of Mr. Weinstock's proposition, it seems incredible that prune growers should be unable to realize that this is the opportunity of their lives.

The Information Bureau is now actively engaged in a personal canvass of the prune growers for information and organization and this seems for the present the all-important thing. If anything practical is to be accomplished this year the next six or eight weeks must show it. It is therefore up to the growers to at once join the Information Bureau, either through the representatives of the Bureau in their respective districts, or by writing direct to the Secretary-Treasurer, Geo. E. Merrill, No. 155 West Santa Clara St., San Jose.

Conditions in Europe.—A strong organization seems to be necessary especially this year on account of extraordinary situations produced by the war in Europe. According to advices in the daily press there have accumulated in all our Eastern seaports such immense quantities of goods to be shipped to Europe because ships cannot be obtained to carry them, that all California railroads have stopped receiving goods for shipments to Eastern seaports. By the 21st of February there were said to be 140,000 loaded cars waiting for ships at seven Eastern seaports. The goods thus waiting at these ports, together with orders for $5,000,000 worth of more goods to be shipped from California and due to be delivered aboard by April 1, but which the railroads refuse to accept for transportation, amount to $13,000,000 gross. "It is a situation that has never happened before in the history of American transportation," said G. W. Luce, freight traffic manager of the Southern Pacific Co. How long this condition will last the railroad men say they cannot tell.

We are not informed by the daily press as to the real cause of this situation. No doubt that war material is given preference in shipping and other goods are left behind. But while the shipping of war material is enormous it alone can hardly account for the lack of ships for other goods. Maybe the following dispatch gives a little more light on the subject:

"Berlin, Dec. 20, 1915 (by wireless to Sayville, L. I.)—Since the beginning of the war to the end of November last 734 enemy ships with a tonnage of 1,447,628 were destroyed."

How many more ships have been destroyed by German submarines since last November we do not know, but almost every day some more ships are added to the list. Dispatches on one recent day, Feb. 26, report the sinking of five ships with a total tonnage of 13,184. Whether this wholesale destruction of merchant ships has anything to do with the scarcity of of tonnage on the Atlantic coast I do not know, but it seems probable to me. If it has, then the question arises: Will this situation not be worse in the fall when our prunes are ready to be shipped?

And then arise some more questions. If the railroads will not haul our prunes to Eastern ports how can we sell any to Europe? And if there are no ships available in the Pacific how can we get prunes to South America even if we should succeed in opening markets there? Will not the unprecedented high freight rates which, according to the London "Statist," had risen last December, from certain ports to England, from 300 to 800 per cent, make the selling of prunes in Europe more difficult or impossible? Is not the confiscation of 35 German ships at Lisbon by the Portuguese government, reported last week, which ships are to be used to transport goods to England, another sign of the growing scarcity of ocean steamers?

Calamity Possible.—Will not the packers use this situation to scare the growers into accepting a low price? And will not the growers be helpless in the face of such a situation the like of which "has never happened before in the history of American transportation"?

If this thing is as grave as it appears to me we may see in California a calamity similar to what the cotton growers had in the South. I can see hope only in an immediate organization of the growers before the prune buyers will get around and "scare the life" out of the people.

That in this emergency Mr. Weinstock as State Commissioner can be of immense help by bringing the resources of the State into action for the growers is self-evident. But he can only do something if the growers will organize.

Why could not the State in this real emergency procure some ships? Why could we not demand that some of the U. S. transports be used once in the interest of the people who paid for them? Has not our government sent a war ship to Europe to bring gold coin and comfort to our millionaires who were stranded there when the war broke out?

Is government help proper and good only for the wealthy, but paternal and bad for all who have to labor hard for a living?

Organize, and you will get your rights! J. Holler.

FRUIT ACREAGE ERRATA.

Attention is called to errors that occurred in the fruit acreage table that appeared in these columns last week. Olives, oranges, peaches, pears, plums, prunes, walnuts and almonds credited in the table to Mendocino county should have been credited to Merced county and vice versa.

San Luis Obispo county should have been inserted between San Joaquin and Santa Barbara counties and credited with the acreage of olives, oranges, peaches, pears, plums, prunes, walnuts and almonds which the table gives to Santa Barbara. In like manner counties appearing after and including Santa Barbara county in the table should be credited with the above fruits in the order named to the county immediately following. Yuba county, for example, has 350 acres of bearing olives and 900 non-bearing, instead of 450 bearing and 75 non-bearing. The 450 bearing and 75 non-bearing should have been credited to Yolo county.—Editors.

BURBANK CHERRIES.

[Written for Pacific Rural Press.]

The Burbank cherry has been fruited very little except in Vaca valley. Here are some points Millard Sharpe notes about it. The fruit ripens early in May, a very little later than the first of the Chapmans in his vicinity; it is larger; and if it cracks, the skin is broken around the side, rather than around the stem as with other varieties; the tree is thrifty, has heavy foliage which protects the fruit from birds and sun. Thrifty big leaves also grow all around the trunk, giving it much needed protection. The fruit is fine, especially if allowed to get good and ripe.

A great many Burbank trees in Vaca valley were planted in cold wet places—the very opposite of what any early fruit needs, especially cherries.

APPLE LIMB HEART ROT.

[Written for Pacific Rural Press.]

An apple limb an inch in diameter had been sawed off leaving a stub on a tree now belonging to Henry Bottcher of Beaumont. A shoot had grown from the side and seemed thrifty. The stub showed sappy rot when examined last winter. It was cut back to the point where the shoot came out. It still showed rot and Mr. Bottcher figured that if the rot were left, it would weaken and kill the limb by the time it would become of good bearing size. He figured that the rot would also extend to the trunk of the tree and make the whole thing die when it had received a few more years of care.

So he cut the limb back to the trunk, and sure enough the rot had beaten him to it, having run downward a foot during the season. The heart was rotten, but the outside sound. Mr. Bottcher now paints all such cuts with asphaltum, but warns against getting the wrong kind, which would kill the healing bark.

HOW TO NAME THE FARM.

To the Editor: We wish to name our farm. Will you tell us what steps to take to make it legal?—J. G. M., Orland

[You should apply to the Secretary of State's office at Sacramento and register it in the same manner provided for the registration of a trade mark. The cost, we believe, is one dollar.—Editors.]

It is reported that jobbers have already been in the field this year to contract for the Thompson Seedless raisin output of the Sacramento Valley, offering 7½ cents a pound.

The Fresno Nursery Company, Inc.

Is it your intention to plant nursery stock this season? In placing your order with us, for whatever you may need, you are assured the very highest grade of stock, we having pleased our many customers the past twenty-eight years by giving them RELIABILITY, QUALITY, SERVICE.

We Have a Large Assortment of

APPLES, PEARS, CHERRIES, PLUMS, PRUNES, APRICOTS, PEACHES, ALMONDS, FIGS, WALNUTS AND CITRUS TREES.

Also a nice stock of ORNAMENTALS on which we would be more than pleased to quote your prices.

BUDDED AVOCADO TREES

"The Avocado as Grown in California," a booklet recently issued, will be sent free upon request.

GROWING budded avocado trees of merit (good trees of the best varieties) is our business—not a side line with us. We are now, and have been for years, devoting all our time to this work. We are dead in earnest in our desire to see the avocado industry progress along conservative lines into the best horticultural business of California.

Many ranchers have already planted an avocado orchard. We have sold the trees to the most of these. Others are thinking of planting. To them we extend a hearty invitation to come to the West India Gardens. You will be welcome, and our time is yours for the discussion of avocado growing.

We have in stock budded trees of all good varieties. Our prices for these trees are as low as it is possible for such trees to be produced and sold at a legitimate, reasonable, profit. The best varieties, the large fruited Guatemalan types—those that are best suited to commercial growing—are more difficult of propagation than the small thin-skinned Mexicans; consequently the trees cost more. We have some cheap trees, trees that we can sell you at $1.00 each, but these are not the trees you will want for a high grade avocado orchard.

What Pear Blight Looks Like.

To the Editor: Will you tell through the Pacific Rural Press what pear blight is like? Your book, "California Fruits," tells how to treat pear blight, but does not tell how it may be recognized.—Reader, Santa Rosa.

[The most obvious effect, to be seen during the growing season, is the blackening of the leaves and soft wood to which they are attached, as though these parts had been touched by a flame, and from this appearance comes its old common name, "fire-blight." More specifically, as Prof. R. E. Smith has written, the leaves, blossoms and young fruit wither and turn black on the affected portions but do not fall, remaining tightly attached to the twigs during the winter after the healthy leaves have fallen. The infection proceeds downwards through the inner bark of the twigs and branches, and when working vigorously the blight kills the twigs or whole branches very rapidly. The disease often runs down into the large limbs, where it remains alive over winter, producing the so-called "hold-over" blight, which is a source of infection during the following season.

The blighted twigs, branches or trunks show a red, sappy, juicy condition of the inner bark when infected with the true pear blight organism. If the disease is fresh and active the bark when cut into is very juicy, exuding the slightly sticky sap quite freely and showing bright red color in the inner bark. This symptom is of importance in distinguishing true blight from such troubles as die-back from sour sap, crater blight and other causes.

In the smaller twigs and branches the organism dries out and becomes entirely dead. But, through the agency of biting insects in the young shoots and suckers, the disease frequently gets into the trunk of the tree and also down into the roots. Here it spreads and causes the death of the tree by slow degrees, due to the destruction of the inner bark of the trunk or main roots. In such cases the leaves of affected trees take on a peculiar bronzy reddish coloration in the fall, which is quite characteristic to the experienced eye.

From the "hold-over" blight in the trunks and large limbs an infectious sap exudes when growth starts in the spring, which sap contains myriads of the blight organism. This sap is attractive to insects, which, in feeding upon it, get the blight bacteria upon their bodies and mouth parts, and transfer them to the blossoms or green shoots of other trees, thus spreading the infection.]

YOUNG APRICOT ROOTS.

[Written for Pacific Rural Press.]

To get better roots on young apricot trees, E. O. Eggen of Hemet soaks the ground thoroughly in spring when he plows under the winter cover crop of melilotus; then irrigates only in alternate months through the summer, to force the new roots to grow downward. The soil is loamy with no hardpan; but an irrigation sole is observed in late summer. Roots above this sole are dried out in the two months interim and the deeper ones are forced to grow more.

Late pruning in the spring is suggested by A. E. Goodrich for young apricots. This allows the roots a maximum time to withdraw nutriment from the limbs before the latter are cut off, and may promote root growth to a considerably greater extent in winter.

When you buy a Sprayer
Follow the Expert

WHEN Universities, Experiment Stations, Tree Experts, and large orchard companies select "Deming" it makes a mighty safe guarantee for you. Save time by using their judgment.

DEMING SPRAYERS offer you over 25 different pumps for different requirements in all types, bucket, barrel, knapsack and power. All working parts in contact with the spray are brass. From the complete power rig to the scientifically-made Deming nozzle, each detail matches the Deming standard—*"for thirty-five years, the World's Best."*

Planet Jr. Orchard Cultivator

For the fruit-grower who wants maximum profits this **No. 41** **Planet Jr Orchard and Universal Cultivator** is an absolute necessity in the orchard, vineyard, or hopyard. Its strong, durable construction and lasting service make it the most economical orchard cultivator you can buy.

This **No. 41** has strong, light frame, low wheels, and tongue, all of steel. Is equipped with fruit-tree shield and side-hitch for low trees. It carries the sweeps, furrowers, plows, and special weeder attachments. Works deep or shallow, and cuts from 4 to 6½ feet wide. Convertible into disc-harrow and alfalfa cultivator. Can be fitted with fore-carriage and spring-trip standards, and irrigation steels.

J. E. Nish, Rialto, Cal., writes: "Have used your Planet Jr Orchard Cultivator for 15 years. Remarkable what a machine it is. To my mind it has no equal."

New 72-page Catalog (168 illustrations) **free!** Describes over 55 tools, including Seeders, Wheel Hoes, Horse Hoes, Harrows, Orchard- and Beet-Cultivators.

COVER CROPS FOR FIG TREES

[Written for Pacific Rural Press.]

Plowing under green manure crops is not generally being practiced by the owners of fig orchards. However, according to G. H. Cross of Ceres, owner of an eight-acre fig orchard of 12 year old trees, nothing is more beneficial to the health of the trees, and nothing else except barnyard manure, which is almost impossible to secure, restores to the ground the material necessary for the wood growth and fruit producing.

His method of handling this cover crop is to do no plowing until the alfilleria and lupin (Lupin, says Mr. Cross, is one of the greatest plants for the storing of nitrogen in the soil. It is a member of the bean family and usually grows about 12 to 18 inches high) has gone to seed, which is about the middle of April, then it seeds itself every year. The ground is given a good irrigation before plowing, as the ground is usually hard and dry by this time. No further irrigating is done during the season. Surface cultivation is practiced to hold the moisture. For this a spring tooth harrow is used. Deep plowing, says Mr. Cross, cuts off the hair-like feeders sent up from the large deep-lying roots to secure the plant food from near the surface. If these are cut off, time is lost by the tree in growing more roots.

Were it possible to irrigate the orchard in the fall after the figs have been harvested, a much heavier cover crop would be received. In the Ceres district, however, this is impossible unless one has a pumping plant.

It has been noticed that certain trees that a few years ago produced sour figs are now bearing figs of very good quality. This change is largely attributed to the increased amount of humus and nitrogen in the soil, or in other words food essential for the making of perfect fruit.

TREATMENT OF GRAPE MILDEW.

To the Editor: What is the cause and remedy for red canes and red spots on Thompson Seedless grape vines? The spots look as if something had struck the cane and then scattered as mud would. If this is a disease, kindly advise me.—B. M. C., Yuba City.

[Answered by Frank Henry, Fresno.]

[As I have received the samples of wood from your grape vines I can say that it has the marks of mildew. The best remedy is to apply dry sulphur. It is not the amount of sulphur used, but the equal distribution of it. Apply it every ten to twelve days, starting as soon as the vines are two or three inches long until about July. That is, taking into consideration climatic conditions. I advise the use of more sulphur than most men, but I don't use it for mildew alone. I find that vines do much better with sulphur than without it—old vines especially. The main use of sulphur is to use it in time; don't wait until you see mildew, then expect results. It is true one can check mildew, but one loses many times over the cost of sulphur and labor. Many will lose by not sulphuring this year because sulphur is high and will try to go through the year without the use of it.]

It is anticipated that pineapple growers of Hawaii will ship 60,000 tons of canned pineapple to the mainland this year.

1916 Seed Catalog

FREE

It tells how and when to plant Garden, Flower and Field Seeds. Write for it.

Seed Potatoes: We now have a fine, true-to-name, healthy stock of American Wonder, Early Rose and Garnet Chili Potatoes. These are all good, early standard varieties, suitable to California conditions.

Alfalfa Seed: Stocks of fancy seed will soon be exhausted. If you intend buying write to us today for prices and samples.

Sudan Grass: This new hay has made good. It produces an abundance of feed of good quality. Our seed is **Free of Johnson Grass.** Prices and samples on application.

The New Orange Picking Sack.

[Written for Pacific Rural Press.]

To pick oranges 50 per cent faster by saving motions, with less injury to them; and to avoid the bits of brush and dead wood which fall into the ordinary picking sack and then into the picking box, injuring the fruit on its way to the packing house, E. R. Canterbury of the Redlands Co-operative Ass'n has devised a picking sack which is proving its worth this season.

It is a good bit like the ordinary bag, but the top is covered with the end of a long sleeve which grows smaller toward the other end. The small end is reinforced with a metal ring about four inches in diameter. This is hinged to a stiff band which fastens around the arm just above the bend of the left wrist.

Instead of reaching down to the bag with each orange the picker grasps the orange, clips it off, drops it by finger and wrist motion into the sleeve whence it rolls easily into the bag, while the hand has already grasped the next orange.

Of a gang which worked nine hours Feb. 5, the men picked 67, 69, 72, 73, 79, 94, and 104 boxes, respectively. They stripped the trees.

The bottom of the bag closes by a "pucker string" through small rings. This string hooks high on the side of the bag about as usual, but does not afford a catching-place for twigs as the folded bottom bags do. Thus trash is almost entirely kept out of the picking boxes.

In the orchard of J. S. Edwards of East Highlands, where the bags were seen in use, J. C. Perry, superintendent of the pickers, said, "I believe it is the coming sack. It makes a picker sore at first because it uses different muscles, but after a week we have trouble trying to change pickers back to the old sacks."

A TUSSLE WITH BUD-EATING BIRDS.

To the Editor: Sparrows and linnets are destroying the opening buds on our almond trees. We cannot put poisoned grain out as the poultry would be apt to get it. Is there anything that could be sprayed on the buds to make them distasteful to these pests? We caught quite a lot with rat-traps by sewing a piece of cotton cloth on the wire jaw to form a bag, using wheat as a bait, but they got too sharp to go near them. We then put out a lot of "Sure Catch" mouse traps without any bag and caught some that way. The wire traps used so effectively back east are of no use in California. We have tried several, but never got more than 2 or 3 in a season. We kill hundreds of them when cherries, apricots and peaches begin to ripen by poisoning the fruit they start to eat, and soon clear the orchard of them. A fresh lot invades the place during the winter. If butcher birds were protected and allowed to breed they would keep them away or kill them, but every boy who owns a gun shoots them, also the robins and larks.—Sam'l Haigh, San Jose.

[We know no spray for bud protection.—Ed.]

VINES UNTHRIFTY BUT NOT DISEASED.

To the Editor: I am sending you cuttings from my grape vines. The canes have dead and discolored strips of bark. The Italians who work the vineyard say they are affected with "Black" disease and require Bordeaux spray. Mr. Volck (County Horticulturist) tells me that grape vines in this valley have no disease requiring Bordeaux. He says that is used for feathery mildew. Can you tell me what treatment to use? The grapes get to the size of small peas and turn black and fall. This you told me last fall was due to imperfect pollenization due to late rain. This wood is of course not affected by that.—L. W. Watsonville.

[Answered by Professor Bioletti.]

[The vine cutting samples show no signs of any disease for which Bordeaux mixture would be useful. They have simply failed to mature and have died during the winter. The wood shows a deficiency of starch. The cause is undoubtedly cultural or climatic. Something has interfered with the proper ripening of the wood. This may have been growing too late in the season, until the leaves were caught by frost, or it may have been some insect or other injury to the leaves during the summer or autumn which prevented the wood from being properly nourished. In any case the only remedy, where canes show the symptoms of those sent up, is to prune the vine back to healthy wood and to leave very few buds on it. A vine with as little starch in as the specimens show is incapable of bearing fruit and is very liable to die back to the ground, especially if it attempts to bear fruit.]

The dates for the 1916 Yolo County Fair have been tentatively set for August 26 to 29 inclusive.

Ancient Farming

Herodotus, in the year 450 B. C., said that good cultivation yielded two-hundredfold in the Valley of the Euphrates. Even in that land of Eden, poor cultivation yielded but fiftyfold.

In 1898, the average Wheat yield per acre in New York State was 21.2 bushels; in 1907, 17.3 bushels per acre; in 1912, but 16 bushels. This does not speak very highly for our Fertilizers.

Average American yield per acre of Agricultural Produce is at present about Eleven Dollars. European yields are more than double.

Isn't it time for our farmers to get down to business methods? Home Mixed Fertilizers will help.

-hardy citrus trees

Thrifty citrus stock—including Washington navel and Valencia oranges, lemon and grape-fruit. Prime, sturdy, two-year-old budded stock—caliper ¾ inch and up. Straight stems. Trees in perfect condition—grown in exposed positions. Best citrus stock that proper soil conditions and scientific culture can produce.

$2 Combination Offer

Four trees — Washington navel and Valencia oranges, lemon and grapefruit $2.00. Additional trees 50 cents each. Single trees, 65 cents each. All trees carefully balled—perfect condition for planting. Write to or ask for Mr. Peck.

We have three citrus nurseries—Escondido, Anaheim and Los Angeles. If you are near these points we can save you money by shipping direct from nurseries. Take no chances with inferior trees — get healthy, robust stock. The Germain reputation for highest quality is back of every tree. Special prices on large shipments.

HOW TO GROW TEPARY BEANS.

To the Editor: Will you give me instructions as to how and when to plant Tepary beans, in a heavy loam soil, capable of irrigation? I want to know how far apart the rows should be and how far between hills in rows.—H. J. C., Esparto.

[Answered by E. Powers, Manteca.]

[To prepare land for Tepary beans, I would proceed along the same lines as when planting any other beans.

The land should be plowed early in the spring and kept cultivated so as to be kept in good condition until planting time, which should be any time in May, if you can hold moisture that late. If not, you must plant the beans earlier. In planting, I would drill the beans in about eight inches apart in the row and have the rows thirty-six inches apart.

I would not attempt to irrigate as long as I could keep the moisture up by cultivation.]

HOW AND WHEN TO ROB BEES.

To the Editor: Will you kindly tell me how and when is the best time to rob bees, and should any honey be left for them or not? They have a small box on top of a larger one with a one-inch hole bored between them. The large one seems to be full, but not any in the small one on top. There is a lot of wild flowers here that are just beginning to bloom, also orange blossoms coming on.—E. P., Terra Bella.

[Answered by Chas. Goodman, Williams.]

[The only time to rob bees is when they have something to rob them of and that is not usually the case at this time of the season. Usually bees need all the surplus honey they have at this time to rear brood with; and if the upper story of your hive is empty you had better leave them to themselves as you might destroy the entire colony.

Robbing bees at this time would be about as fruitless an effort as to rob a train of empty flat cars. If you intend to produce honey, it will be much better to get modern hives and transfer your bees from the boxes, such as you described, to them.

If you are not familiar with modern methods, and it does not seem that you are, it would be well for you to get a copy of the A B C and X Y Z of Bee Culture, which would be of incalculable value to you in the management of your apiary. This book sells for $2.00 and you can no doubt obtain a copy from the Pacific Rural Press at that price.]

EASTERN OR CALIFORNIA SEED CORN.

To the Editor: I wish to ask your opinion concerning the planting of Iowa seed corn in this State. Will it produce a good crop without first being acclimated?—E. T. F., Chico.

[Answered by W. G. Stimmel, San Francisco.]

[You can raise corn in the interior valleys of California from Iowa seed, but my experience has shown that you can raise better crops of corn, all other conditions being the same, from California grown seed.]

"The biggest thing you can say about Imperial Valley," says F. W. Waite, "is that the levees held, though the river ran within two feet of the top of the cement headgates at the intake, higher than ever before."

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau, at San Francisco, for the week ending at 5 p. m., March 7, 1916.

STATIONS	Rainfall Data: Past Week	Seasonal To Date	Normal To Date	Temperature Data: Max'm	Min'm
Eureka	2.92	32.60	33.29	56	38
Red Bluff	.68	19.04	18.51	68	34
Sacramento	.80	17.80	14.64	62	38
San Francisco	.94	26.50	17.26	66	44
San Jose	.30	15.40	12.50	68	36
Fresno	.94	10.78	6.86	62	38
Independence	.28	7.14	6.69	66	—
San Luis Obispo	1.20	25.62	14.96	72	38
Los Angeles	.26	19.23	11.74	80	46
San Diego	.48	11.97	7.59	70	48

THE WEEK

AS THE season is one of plenteous rains, early, middle and late, we may be pardoned for taking pains on their causes to speculate. For it will hurt no crops if we do offend the physical powers which struggle or blend to shape these agricultural ends of ours. We therefore make bold to comment upon current affairs in the search for a way to tell in advance what seasons may be. In a way, Church and State in California seem to be at issue in this matter, for Father Ricard's sun-spot-and-planetary conjunction stronghold is being shelled by the astronomical authorities at the Lick Observatory and Mt. Wilson, and his connecting galleries between the sun spots and terrestrial storms are being broken up. For it is shown that if the spots on the sun are due to electric storms, it does not follow that they have any relation to electric storms on the earth. Even if they both generate the same kind of juice for their own disturbances it is as idle to think that one influences the other as to expect that an American would be made drunk if a Russian should get behind his door and take a sly pull at the vodka. For the State astronomers hold that no matter how much is proved that the two disturbing juices are similar, the disturbance on the sun is too weak to set the earth agog—and we believe the same concession and claim can be made in the case of vodka. And we believe, though we do not get it from the astronomers, that a spot on the sun, which you can never look at without a smoked glass, can no more disturb his ordinary business of warming and illuminating the world, than a single San Jose scale on the skin of a ripe Bartlett can arrest the flood of perfume which it exhales to your delighted senses. And so we take it to be established, for the present at least, that if we are to know our weather for months in advance we must look for the signs of it in some place nearer than the sun.

IS THERE HOPE OF CANNED WEATHER?

FORTUNATELY, yes; and the sign of it may be found in the ocean, where all kinds of reasons would lead one to look for it. In fact, all our Pacific coast weather experts have been looking in the ocean for the reasonable forecast of our coast storms for a quarter of a century or more, but have found no perch from which to make systematic observations. Now it appears that no such perch may be required: that perhaps one may run out over the ocean with an aeroplane, take the temperature of the water here and there, and thus foresee what the ocean is going to do, as soon as the deep sea temperature, progressing upward or downward, shows a direction which may culminate in a disturbance in the embracing atmosphere or in an enduring calm. If the former, we shall get wet on the land, for the general movements will carry the disturbance thence. If there is nothing doing over the water, we shall continue to bask in brilliant winter sunshine. It is out of our line, of course, to go into the meteorological minutiae of this matter, but simply to record what seem warranted expectations from it. The work is being done by Dr. George F. McEwen of the University of California faculty at the Institute for Biological Research at La Jolla. By his method Dr. McEwen hopes ultimately to be able to predict some months ahead the general characteristics of the approaching season's weather. The chief practical significance of Dr. McEwen's discoveries is that, knowing the main factors in the problem of ocean temperatures in this region, and knowing further how the climate depends on the condition of the ocean, it will be possible by a study of the winds over the sea and of the sea itself, to predict months in advance what, in a general way, the climate of the adjacent land is going to be. And declaration that a coming rainy season will be prevalently wet or dry seems to be quite within the range of results from the ocean studies which are now being made with ships supplied with proper detective apparatus.

NEED OF CANS FOR AMERICAN EXPORTS.

IT IS clear enough that as California products increase we shall need more ships to carry our supplies to distant purchasers, and from the point of view of preserving value we can look upon the ship as a can—without insisting that the constructive materials of both are now alike as well as the purposes thereof. It is a historic fact interesting to recall that the first needs and opportunities of California, sixty years ago, were prominent among the forces which made the United States lead the world in merchant marine. Our people are apt to forget that Great Britain was not always mistress of the seas, but that from about 1815 to 1860 Uncle Sam had more ships than any other nation and the Stars and Stripes was the world's emblem of greatness and uprightness in sailoring. Then England bought us out and lawed us out, and we took to civil war, to railway building and other business, to neglect of shipping and all that to this day. Now California needs plenty of fast ships vastly more than she did in 1849, and will get them, and it begins to look very much as though they would be largely American ships. In a recent letter, approving of a Boston plan to make Sunday, May 7th, "sailor's day" in the churches, Secretary of the Navy Daniels has written as follows: "The sailor has always been one of the most useful men in any country. While it is true that the United States has allowed their merchant marine to decline, we have, nevertheless, come to a day in our national history when we must rebuild that marine. Already the great shipyards of the country are crowded with new ships, and are hastening the time of their launching. A great Navy and a great merchant marine must always go hand in hand. The very fact that we have built a great Navy and are increasing it today as never before, is an earnest evidence of the fact that we must soon also have one of the greatest merchant marines in the world. The sailor, therefore, is the coming man." Of course it takes money to build ships as well as men to sail them, and there should be a wide disposition to treat both fairly and each according to its deserts. For California needs more ships now than ever before in her history.

CALIFORNIA CANNED FORAGE.

SPEAKING of weather preserved for future use reminds us that this issue has much to say of another canned product, and one which may rival in aggregate value all the fruits, garden-sass and salmon which we are now putting in tins for local use and export. It is the matter of canned forage which has now, after decades of irregular development, reached a demonstration and headway which will carry it to importance and value of resulting products which cannot be foreseen. The silo as a means for securing succulent forage, out of the growing season thereof, was first brought to the attention of Californians by the Pacific Rural Press in 1877. We had at that time not only references to it drawn from the advocacy of the method by Professor Caldwell of Cornell and other Eastern leaders of that day, but a special contribution by the late Felix Gillet, giving translations from the French—for the French must be given credit, not for inventing the method, but for starting it on its present course around the world. At that time the advocacy pointed to the original form of the silo—a pit in the ground, as the word indicates. But it was not long a subterranean affair in this country, and the first California silo was above-ground. It was built in San Benito county and was hardly tighter than an ordinary tank-house, and it made a lot of bad corn silage, which poisoned a few horses; which, at least, did not help the new proposition to popularity in California. But this was not the chief reason why the silo made slow progress in California. Pioneer farmers and dairymen could not see the need for the cost of structure and filling machinery to make canned forage, when, theoretically, green feed should be growing most of the time in this mild climate. Most stock men preferred to let the clouds and the soil do the growing and the stock do the harvesting. Even those who believed in growing special crops for feeding, and there were not over-many of them in that day, thought they could do better by growing summer-sown beets and other roots to supplement scant winter pasturage and winter-sown roots for scant summer and fall pasturage—and have plenty of green corn-fodder and alfalfa, whenever they could get them, and thus came the wide impression of three decades ago that the silo would have scant opportunity in California live stock feeding policies. But there were, here and there, individuals who did well with siloes and strongly recommended them to others. In the

'80's there was perhaps no more persistent silage-advocate than Mr. Jewell of Petaluma, and at one time Two-Rock valley, near that town, had more siloes within its borders than existed in all California outside. In the '90's the leading silo-supporter of the State was the late Mrs. Minna Eschelman-Sherman of Fresno, and she preached and practiced the silo method to the great advantage of the State. Since 1900 silo construction has spread rapidly and compassed all parts of the State. It has found one of its great supports in the demonstration that many other green stuffs than corn can be profitably handled, and that many such stuffs are not only preserved for feeding when forage is scant, but are given, by the process of preservation, more readily and easily available nutritiveness than they possess in the fields that grow them. Another demonstration, which has strong force, in the present rapidly growing popularity, is the desirability of good silage for other stock than dairy cows. To the animal caterer, in fact, there has come, in well-filled siloes, an assurance and a consolation against scant fields at home and high prices in the markets, which is like that with which the housewife meets a bunch of unexpected guests when she has a fragrant ham on the wall and a lot of canned peaches in the pantry. Then, of course, aside from emergencies in animal catering, there is the constant assurance that silage, put in a good receptacle with the best labor-saving machinery, is not only good for nutrition, health and juiciness of body, which favor growth and free secretion, but is cheap and therefore directly a minister to the economics of production. It is true that California has awakened slowly to the desirability of the silo, chiefly because it is possible to have so many things freshly growing at so many times in the year, but the State is none the less fully awake at the present time. It seems to be altogether beyond question now that the better that California is than other States without the silo, still better California is with all her fresh vegetation supplemented by it. For this reason the reader will find much about siloes in this issue.

WILL ENGLAND STOP BUYING FRUITS?

WE HAVE not much confidence in the current rumor that "England has declared an embargo until next August against both canned and dried American fruits." If she has, she will have to expropriate all the supplies now in England, or regulate the sale of them, for the hands which now hold perhaps supplies enough to last almost till that time, will have a merry time putting up prices and robbing consumers. Such importers would like nothing better than such an embargo against later, competing importations. Such an embargo would, therefore, from this distance, seem to be a greater injury to Englishmen than to Americans, and there is no reason why the government should intend injury to either. If the embargo is planned to make people more economical, as some commentators remark, there are many other things which could be more safely embargoed than the imported fruits which the English have relied upon for centuries to keep them hale and hearty, and which are relatively cheaper in preserved than in fresh forms. This would certainly work an injury to the English people which the government would not be likely to overlook. As for injury to Americans, it would probably be not bad for the crop of 1915, which is largely disposed of, nor for the crop of this year, because it cannot be ready until August, and there is no great carry-over to menace that. We are, therefore, thinking and writing awkwardly to account for a thing which may not be coming to pass at all. It may, after all, only be an audible dream by those who would like to rattle producers a little to get them ready for a spring-contracting campaign. The cure for such a thing is for producers to be so well posted that dreams cannot disturb them. And if you wish to think about that, with special reference to its bearing on prunes, you cannot do better than read carefully the letter by Mr. Holler on another page. He passes no whispers; he just naturally cries out for organization.

JACKASSES AND JACKASS RABBITS.

WE HOPE it is not true that our systematic scientists and game experts are making it hard for the San Joaquin valley people to rid themselves of the jack rabbit pest. The report comes, however, that way, to the effect that hunters of Fresno county insist that the jack rabbit belongs to the order of rodentia, which would classify him as a rodent and make him a predatory animal. The Fish and Game Commission, however, insists that he is of the order of lagomorpha, and of the family of leporidae, which brings the rabbit into the classification of game animals. No license is required to hunt predatory animals, but a license is required to hunt game animals. We have a strong impression that we do not care whether the jack rabbit belongs to the leporidae or not, or whether he may belong to the lepidoptera. He is surely a winged pest, and every man's gun should be against him. whether he is a licensed or unlicensed marauder. No law should be made on scientific relationship, but upon what a beast does to man in any place where a man is expected to live and have property. To keep a country alive with jack rabbits because sportsmen like, once in a while, to run a course or because nature-lovers do not like to see a species run out, is no consideration as against the vines and trees which these light-footed rascals destroy. The State ought not only welcome hunters to help clear the country of them, but might well furnish munitions to that end.

Queries and Replies.

Querists must give name and address.

What About Rural Credit?

To the Editor: The Farmers' Union and Farm Bureau members are giving some attention and discussion to rural credits. Could you tell your readers briefly how it now stands and point out how we can try to influence our senators and other legislators to give us something? True, the people voted it down at the last election, but I think they are sorry.—J. C. Galloway, Modesto.

The only pending legislation which can reach Californians is in the Congress, where a bill approved by a joint committee of both houses is awaiting action. It prescribes a way for organizing land banks on what the conservative economists call a "safe and sane plan," because it does not call for use of public funds and does not provide government guarantee of security for bonds. It arranges a way by which associations of farmers can have banking arrangements of their own under government regulation. It provides machinery by which farmers can assemble their security and secure collective credit upon it. It is all that is to be had from this session of Congress, and Congressmen can be called upon to vote for it. It may be more than can be had, for politics may knock it galley west until after election.

As for State legislation on rural credit there can be none until the legislature of 1917 assembles, but the "commission on rural credit" appointed by Governor Johnson is still alive and the governor may be expected to say something to the legislature next January—unless he should be elected president of the United States before that time. It looks to us like a period of watchful waiting.

Mid-summer Alfalfa-Sowing.

To the Editor: Would you advise seeding alfalfa on irrigated land in July or August? H. H. B., Turlock.

No, we do not advise it, but we would like to have some reader advise it if he can do it on the basis of successful experience. Because we believe that such sowing ought to succeed if the ground is deeply wet with irrigation; then plowed deeply, then irrigated again and after a few days harrowed or disked lightly, not making the surface too fine. Then sow and brush over the surface which would roll over the small clods and press the seed lightly into the moist soil. The young plants will make their way around the protecting small clods and should grow so fast that another irrigation can be given before the soil gets deeply dry. If any one has secured a good stand in mid-summer please tell us how. If no one has done it, will not some one try a small piece in this way and report results?

The Flat-Head Borer.

To the Editor: What treatment shall I pursue for the worm they call the "borer"? It is a small white, round worm, with a flat head, and bores into the young apple trees. Everybody is troubled with them here and they have nearly destroyed my orchard by eating their way into the heart of the tree.—C. W. F., Dos Rios.

The current generation of flat-headed borers has probably done all the harm it can by this time and will be making its way toward the outer bark where the worm will change to pupa, and from that will come a grayish, greenish bronzy beetle about half an inch long. These beetles will skirmish around for a spell and then take to laying eggs on the bark of trees, generally near the ground; preferring sunburned or otherwise injured bark, even if they find it higher up. From these eggs comes another generation of flat-heads, which excavate first under the bark and later may go into the wood, as you find them. The first way to fight these pests is to keep all bark which can be reached by the sun after the foliage appears, thoroughly covered with whitewash and keep it covered by repeated applications. Then, in the summer and fall, look for discolored places on the bark where the whitewash may not have reached, cut in and kill the grub with a knife or, if you find a hole, push a wire to the end of it and kill the grub that way. This examination must include the bark below the loose ground surface, for younger trees are sometimes girdled at that point. Examinations should be made at once (if not made earlier as they should have been) and trees badly hurt in that way should be replaced before it is too late to do it this season.

Following Blackeyes With Mexican Reds.

To the Editor: Would it be advisable to plant Mexican Red beans on land that has been planted to Blackeye beans for the last two seasons where the Blackeyes produced two-thirds more the second season than the first season? How will Tepary beans do on land that has been planted to grain two seasons and Egyptian corn one season?—W. A. A., Ceres.

[Answered by Prof. John W. Gilmore, University of California, Berkeley]

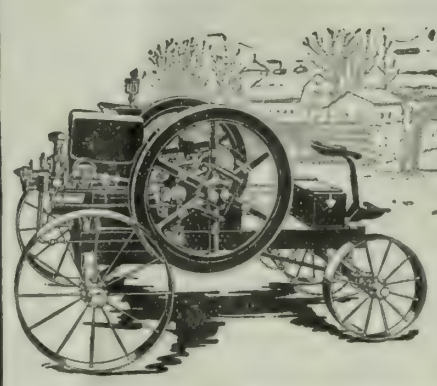
[If the land is reasonably fertile I see no disadvantage in following the crop of beans with a crop of Mexican Reds. Both of these varieties are adapted to about the same type of soil. It might have been a good plan to follow the Blackeye beans with a crop of grain, for grain is usually much benefited by a previous crop of beans. However, it is believed that the season is now too far advanced for sowing grain, consequently the sowing of beans or some other summer crop is the only way left. No doubt a crop of feterita, or dwarf milo might do well following a crop of Blackeye beans, but it is not evident that the sorghums will give a more valuable harvest than the Mexican Reds.

Tepary beans generally do well upon grain land in the vicinity of Ceres, and since these beans are relatively short seasoned it is sometimes possible to secure two crops during the year, the first crop being planted in April, and the second during July. It should be pointed out in this connection, however, that Tepary beans should be marketed as such and not as small whites. The California market for small whites, which is a good one, is being injured by selling Teparies as small whites.]

CALIFORNIA FERTILITY GOES DEEP.

California soils are rich nearly double as many feet down as soils in humid regions are inches, according to the results of soil studies now going on at the University of California.

Although it has long been known that most of the soils of the agricultural regions of California have great depths and that when properly encouraged by moisture and aeration the roots of trees penetrate downward for very many feet, it has been a question as to the plant food conditions below the surface. The large collection of 110 soil columns, ten to twelve feet in depth, secured by Professor Loughridge from all over the State several years ago and arranged in the lecture room of Budd Hall at the University of California, has afforded an excellent opportunity for study of this question and the results of physical and chemical investigations of each column are now being prepared for publication by him in the University Agricultural series. The report on the distribution of humus and humus-nitrogen throughout each column in the depth of twelve feet has already appeared, in a pamphlet of 100 pages (Vol. 1, No. 8). As humus is a distinguishing characteristic of a soil and marks its depth, it was shown that California soils have depths of very many feet, instead of but six or ten inches, as in upland humid soils. Similarly, the coming report will show that at depths of six and twelve feet, and even more, the soil is very generally as rich in available potash, lime, and phosphoric acid as at the surface and frequently much richer, thus emphasizing the great economic importance, from a fertilizing point of view, of enabling tree roots to utilize this richness instead of drawing exclusively upon the upper soil, as is the case in the humid region.



MOON FARMING AND FETERITA.

To the Editor: What is your, and the scientific, opinion concerning the planting of seeds according to the signs of the moon? Would also appreciate information concerning yield, sale, price, etc., of "feterita" in comparison with milo maize?—W. H. M., Visalia.

[Prolonged investigation by the Weather Bureau determined that no difference was found in planting in different phases of the moon. If we paid any attention to it, we should plant in the dark of the moon, so that we might get the plants up to use the little more light which the moon gives.

From accounts we have received from growers, feterita seems to yield somewhat more than milo maize, especially if the plants are subjected to drought conditions. We have heard of no one having trouble in disposing of good feterita, through the ordinary channels and at approximately the same price as the other sorghums.—Eds.]

Welcome News on Engines

WON HIGHEST AWARD PANAMA-PACIFIC

International Harvester Kerosene Engines Mogul—Titan

INTERNATIONAL Harvester Mogul and Titan engines work successfully on kerosene, running on light or full loads. They use the least expensive of oil fuels. You are not limited to one kind of fuel, as with a gasoline engine, but can use any kind that is most convenient or least expensive. That is a very real advantage.

You know something about I H C engines. You have heard of their thorough reliability, the good material and workmanship that goes into them, the ease with which owners get repairs and service when needed, the years they last—and the other points that have sold a quarter million I H C engines.

But do you appreciate what real kerosene-burning means—what it saves you in money—how it assures you an unlimited supply of cheap fuel? You need Mogul or Titan kerosene-burning engine power to be sure of always having power at a price you can afford.

Ask the I H C dealer to show you a Mogul or Titan engine—sizes from 1 to 50-H. P. If you prefer to write us, we will tell you where you can see our engines and send you catalogues at the same time. Drop a card to the address below.

P. & O. No. 40 Combined Corn and Bean Planter

Furnished with open center or solid concave tires.

The Combined Corn and Bean Planter here illustrated is a machine built by one of the largest manufacturers of planters in the world, particularly to meet the requirements of the Pacific Coast trade.

It is not a made-over machine but is built from the ground up for Coast needs. This fact, together with the reputation of the P. & O. Company for building tools right in every detail, insures absolute satisfaction to every user of this planter.

It's the Way They are Built

FEATURES:

Equipped with a full set of plates for planting any of the different kinds of corn or beans commonly planted in California, including Egyptian and Kaffir corn.
Adjustable to any width rows from 28 to 44 inch. The check rower machine is adjustable for checking rows 3 ft. 4 in., 3 ft. 6 in., and 3 ft. 8 in.
Accurate planting insured by the sight feed. Sight feed has a large opening, and the seed is visible at all times to the operator as it drops from the hopper to the upper valve.
Quick, detachable runners held on the shank by one bolt. Easily removed for sharpening.

Write for descriptive circular and address of nearest agent.

Baker & Hamilton
San Francisco, - Cal.

BUSINESS METHODS IN FARMING.

To the Editor: There is much hysteria these days about Rural Credit. Many people think that a farmer should be allowed to borrow money to at least 60 per cent of the value of his land. Such a privilege would be all right, provided the farmer had good business ability. My contention is that the farmer is not a good business man, and should not have access to large loans. It is simply a lack of business training with the farmer. I know a good farm that was run at a loss for years simply because no accounting was done. It took a son, who had been away from home, to discover that the profits from the fruit was supporting a non-paying chicken business. A regular set of books was kept and every department of the farm that didn't show a profit was discontinued. The mortgage was lifted in a few years.

In the early 50's two men settled in this section; each acquired a large tract of land. They both reared big families. One, whom we will call A, deeded his land to his heirs with the proviso that it could never be mortgaged. The other (B) made no such proviso. B's land was somewhat better than A's. The families were about the same in most respects. Today, after some 15 years of ownership, the heirs of A have their land free from debt and are prospering. The heirs of B have mortgaged about half their land.

These cases that I have cited do not substantiate my contention, but they do throw a little light on the subject. **W. Ralph Thomas.**

Gilroy.

ADVISORY BOARD FOR STATE COMMISSION MARKET.

During the past week the following advisory board has been named by Col. Weinstock, State Market Director:

James Madison, Fresno; F. B. McKevitt, Sacramento; G. Harold Powell, Los Angeles; W. B. Kiggens, Lindsay; G. H. Cutter, Sacramento; William Glass, Fresno; W. E. Sprott, Porterville; E. E. Ogden, San Francisco; F. S. Jerome, Watsonville; T. C. Tucker, San Francisco; Chas. Donlon, Oxnard; F. W. Andreasen; San Francisco; Robert Newton Lynch, San Francisco; Dr. James B. Bullitt, San Francisco; Chester H. Rowell, Fresno; Mortimer Fleishhacker, San Francisco; General N. P. Chipman, Superior Judge of the Appellate Court; Professor Thomas F. Hunt, University of California. Berkeley; Frederick J. Coster, San Francisco; A. Schilling, San Francisco; Aaron Sapiro, San Francisco; E. O. McCormick. San Francisco.

The farmers in the Bellevue section four miles south of Santa Rosa are endeavoring to organize a drainage district whereby arrangements will be made for the drainage of about 8000 acres of land in that section. They are also trying to cooperate with the Cotati valley people to drain an additional 4000 acres in that section, making a total of 12,000 acres in one unit. This district comprises one of the richest and largest level bodies of land in Sonoma county. The proposition was put before the Supervisors and authorized by them at a meeting on Feb. 4. A meeting will be held on March 11 and directors will be elected. They will then make a survey and an estimate and provide for a bond issue. They figure on being able to do the work at a cost not greater than $5 per acre. If the proposition is put through, it will be one of the most important pieces of work ever undertaken in Sonoma county.

SHOCKING OR STACKING ALFALFA FOR MEAL.

To the Editor: I am desirous of mealing my first crop of alfalfa and binning it and would like to know if I can run it directly through the machine from the shock or whether it will have to be stacked and sweated first.—C. P. H., Fowler.

[If you can get it good and dry in the shock you can run it direct from there into the machine, but that may be a difficult thing to do with the first cutting on account of the spring showers. Stacking would therefore probably be the safer plan. But isn't there danger in grinding the first cutting into meal on account of the scattering foxtail and other weeds which are usually to be found in that cutting?—Editors.]

SILOING VOLUNTEER CROPS.

To the Editor: Would appreciate any information you can give regarding the filling of silos with wild oats with some foxtail or with alfilaria.—J. A. P., Oro Lomo.

[Oats and other cereal fodders should be cut for silage purposes after the kernels have passed the milky stage. If left in the field till nearly ripe water should be supplied liberally while running through the cutter. Foxtail should be siloed while still green and before the beards become hard. This applies when siloing alfalfa infested with foxtail. We have never heard of anyone siloing alfilaria, but should proceed with it in the same manner as advice about siloing alfalfa which appears in other columns of this issue.—Editors.]

Eight cars of oranges left Pomona on March 4 for the East.

John Deere Disc Plows for Tractors
For Field or Orchard

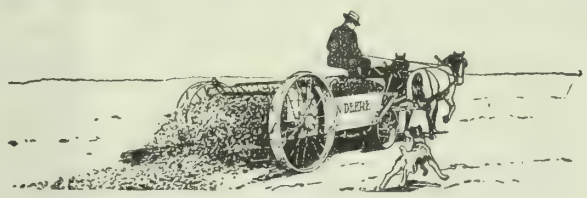
MADE especially for use in the West. Work successfully in every soil where a disc plow should be used.

Plow anywhere from five to twelve inches deep.

One-man outfits—controlled by man on the tractor. Work with any standard tractor.

Can be used either for field or orchard work simply by changing the land axle.

All levers down close to plow when at work—plow can be operated close to trees and under limbs without injuring them.



Easily transported—special lever at the rear for lifting discs high and level.

Over fifteen inches clearance under beam; twenty inches between discs.

Twenty-four or twenty-six-inch discs with chilled metal bearings—constructed so that bearings do not drag along wall of furrow when plowing deep.

Can be reduced to four discs by taking off one intermediate section and telescoping connecting rods.

Write for free booklets describing the John Deere Tractor Disc Plow No. 10 for field work and No. 11 for orchard and vineyard.

John Deere Spreader
The Spreader with the Beater on the Axle

ONLY hip high to the top. Wheels out of way when loading. Mounting the beater on the axle is patented. Write for Spreader booklet.

Three exclusive John Deere Spreader features:

[1] Beater on the axle—nothing else like it. [1]

[2] Revolving Rake—load moving back to beater revolves the rake. Draft actually less. Even spread certain—no bunching. [2]

[3] Ball Bearing Eccentric Apron Drive—requires no attention. Performs wonders in the working of the spreader. [3]

R. & V. Engines
Dependable Farm Power

"R & V" Triumph—always develops rated horse power—made in 1, 1¾, 2½, 4, 6, 8,10,12, 16 and 20 H. P. sizes, stationary and portable.

Easily started; perfect speed control (speed can be varied 40 per cent without stopping engine). Complies with insurance regulations. Hopper cooled—a simple, efficient system that does not require long pipes and numerous fittings.

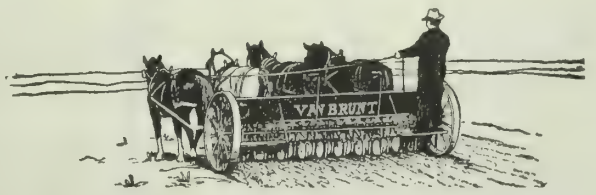
High grade throughout. Inspect the extra guard ring over piston pin to prevent possibility of scoring cylinder. Ask about the "R & V" oscillating magneto. Write for free booklet.

John Deere Plows for Light Tractors
For Orchard and Vineyard

Practical—work with any standard tractor. One-man outfits—controlled by man on the tractor.

No levers—one reason why these plows work so successfully. Plows leveled and depth regulated by screw device. Can be run close to trees and vines without injuring branches.

High and Level Lift—Pull the rope and all bottoms raise high and level. Another pull lets them down.



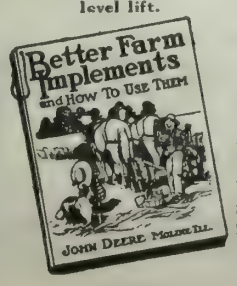
Plows raised in fourteen inches ground travel. Make square headlands.

All bottoms raise high like a double bail, high lift horse plow. You know from experience what this means. Plows do not clog or gather trash on the turn.

Extra wide and semi-floating front truck.

Equipped with either three or four famous John Deere 12-inch bottoms with Quick Detachable Shares—the shares that can be taken off and put on in one-fifth the time it takes to change bolted shares.

Write us for free booklets telling all about John Deere Light Tractor Plows for orchard and vineyard work, or Light Tractor Plows for regular field work—the plows with Quick Detachable Shares, high and level lift.



Van Brunt Drills
With Adjustable Gate Force Feed

THEY plant any small seed, alfalfa to bearded oats, peas or beans. Quantity per acre easily regulated merely by shifting feed gauge levers.

All the ground planted without wasting seed. The Van Brunt adjustable gate force feed and special agitator in the hopper compel seed to leave hopper in even, continuous streams.

An even stand of grain is certain. Pressure springs compel discs to make furrows of equal depth and seed is protected until it reaches bottom of furrow. Single or double discs. Write for free booklets.

John Deere Dealers Everywhere
Better Farm Implements and How to Use Them

BOOK FREE—168 page reference book—tells all about a complete line of farm implements and how to adjust and use many of them. A practical encyclopedia of farm implements. Worth dollars. Describes and illustrates: Plows for Light Tractors; Steel and Chilled Walking and Riding Plows; Disc Plows; Cultivators; Spring Tooth and Spike Tooth Harrows; Lister Plows and Cultivators; Disc Harrows; Alfalfa and Beet Tools; Farm and Mountain Wagons; Teaming Gears; Manure Spreaders; Inside Cup and Portable Grain Elevators; Corn Shellers; Hay Loaders, Stackers, Sweep Rakes, Mowers, Self-Dump Sulky and Side Delivery Rakes; Hay Presses; Kaffir Headers; Grain Drills and Seeders; Grain Binders; Corn Binders; Gasoline Engines. This book sent free to every one who states what special implements he is interested in and asks for Package No. X-152.

JOHN DEERE MOLINE, ILL. THE TRADE MARK OF QUALITY MADE FAMOUS BY GOOD IMPLEMENTS

John Deere, Moline, Illinois

General Agricultural Review.

CITRUS AND SEMI-TROPICAL.

Senator Clifford Coggins will plant 1,000 grapefruit trees in the Mesquite Lake district of Imperial county.

The Surprise avocado is a new thick-skinned variety which ripens late in February. This is very desirable, as it may be shipped when other fruits are scarce.

String beans are great hosts for citrus red spider, according to Wm. Warner of Covina, and should not be planted in citrus orchards, except perhaps as a trap crop.

Avocados are being grown from cuttings by L. E. Nigh of the Armstrong Nurseries. It takes about two years to get as good a root system as seedlings make in one year.

Red spider is menacing the citrus orchards pretty generally through Southern California. Spraying with lime sulphur or Shurekill oil emulsion is being practiced in many orchards.

DECIDUOUS FRUITS.

Winter Bartletts and Winter Nellis are being put onto the Los Angeles market in fine shape early in March at $2.50 per box.

Deciduous tree planting can continue safely until April 15, according to Grant Stoneburner of the Armstrong Nurseries.

Nine tons of Tuscan peaches from 5 acres of dry-farmed, 8-year trees in the Ontario district were sold without dockage to the canneries by M. Rusznak last season.

Members of the Beaumont Fruit Growers' Association have been called to a meeting on March 18, for the purpose of making some amendments to the by-laws.

The report of the Butte County Horticultural Commissioner shows that there are 19,905 acres planted to fruit trees in that county, with prunes and olives in the lead.

That the California dried fruit industry is making rapid strides in supplying domestic and foreign needs is evidenced by the fact that the exports of domestic dried fruits have increased in value from $28,868,000 in 1914 to $36,924,000 in 1915.

Irvin H. Reimers, Supt. of the Wylie M .Giffen ranch near Merced, reports that they are putting out 40 acres to Orange cling peaches and the same amount to White Adriatic figs. Next spring they hope to set out 200 acres to Calimyrnas and peaches.

Great activity in tree planting in Sutter county is reported. J. Bender recently received a consignment of 500 prune trees, R. S. Childs has imported some 1000 prune trees, and T. L. Quigley recently received about 1200 young trees, mostly almonds.

Beginning March 6, an expert force of canvassers were sent out in the peach growing districts by the California Peach Growers, to learn among other things the attitude of the growers toward this new association, and to secure if possible the necessary subscriptions by May 1.

Ground will be broken within a week for new canneries at Ontario and Chino, by the newly organized San Antonio Fruit Growers' Association. The growers of peaches in Pomona Valley are unanimously cooperating with the Association, believing same to be their salvation in marketing their future crops.

GRAPES AND SMALL FRUITS.

Regulations fixing a standard weight of berries when offered for sale in containers have been announced by Chas. G. Johnson, State Supt. of Weights and Measures.

Of the 15,000 additional acres demanded by the California Associated Raisin Co. by April 1 before they would renew their contracts with the growers, only 4000 more are needed.

The berry districts of Puente and Rowland, Los Angeles county, are almost entirely changed over to orchards, principally walnuts. From Rowland alone four years ago $76,000 worth of berries were shipped.

The Dollar strawberry in the Rowland-Puente district grows too small to be of commercial value, according to R. P. Paden, one of the oldest shippers. Brandywine and Klondike are the commercial varieties.

Sixty acres of Muscats owned by Benton Ballou near Ontario are mostly sent to the wineries, complaint being made in that district that the Associated Raisin Co. was slow in making settlement and the growers snubbed.

At the recent annual meeting of the trustees of the California Associated Raisin Company at Fresno, the Board of Directors, consisting of Wylie M. Giffen, Hector Burness, A. G. Robinson, H. Graff, H. H. Welsh, A. G. Wishon, and Jas. Madison, were re-elected.

The present season is the first that the Rowland Berry Growers and Shippers will not have enough home-grown strawberries to fill orders and will have to get some from other berry districts in Los Angeles county, according to F. F. Fleming who has been in the game from its start there 12 years ago.

GRAIN AND FIELD CROPS.

A potato contest is now in progress by the members of the Placer County High School Club.

Arizona farmers have been urged to plant field peas by Prof. Morse of the University of Arizona.

Last season 13,000 acres were planted to rice in Butte county; this spring 38,000 acres will be seeded.

Grape Vines

We are closing our stock of resistant grafted vines—**Carignane, Zinfandels, Petit Sirah and Cubernet.**

First choice vines at $45.00 per 1000.

Save Money on Wire Fencing!
-send for WHITING-MEAD'S Free 1916 catalog
showing how to save money on Building Material

WARNER FARM FENCING, 50c ROD.

This price in 20 rod rolls. Made of No. 10 galvanized wire with Glidden galvanized barb wire margins. This is an exceptionally good fence, designed to be used for turning both large stock and pigs. The Warner Farm Fence is made with the same tie as other Warner styles. The barbed borders are a great advantage. The barbs on the bottom prevent hogs from crawling under, and those on top prevent stock from reaching over and depressing the fence, while by their being woven into the fence the danger to the stock is removed. It should be remembered that it is just as important to prevent going over or under a fence as to prevent going through.

Bankrupt Stock of Shovels.

About 1,000 at 65c Each. Delivered Free to You.

-Another fortunate purchase, a lot of shovels, about 1,000, all in splendid condition, but from being in a warehouse during recent rains have become slightly water stained, but this in no way affects their usefulness.

—Choice of Long Handle, round or square point shovels, or the "D" handles with round, square or scoop shovels any one of them or as many as you want, 65c each, delivered free within a radius of 100 miles of L. A.

Ready Roofing, $1 a Roll.

—"Our Leader" put up specially for us by one of the largest roofing manufacturers in the world. It's 1-ply smooth finish, and is easily the best value that we have ever had to offer at even a higher price.

—Each roll contains 108 sq. ft. with nails and cement for laying. This will cover 100 sq. ft. of roof, allowing for laps. Other roofings at like low prices:

1 Ply King, per roll.....$1.25
2 Ply King, per roll.....$1.75
3 Ply King, per roll.....$1.75
Snow-White Roofing Paper, per roll $1.75

Paints $1.50 Gal.

You can buy paints cheaper from us than any other dealer in the West. We buy in large quantities and sell for the lowest prices.

—Standard House and Floor Paints, $1.50 per gal.

Standard makes of varnishes at 25% off regular prices.

Everything in Paints, Wall Tints, Brushes, etc., at big savings to you.

Dutch Kalsomine, 4½c per lb.
Black Graphite Roof Paint, per gal.* 50c
Standard Roof Paints - red, green, gray — per gal.* 85c
Shingle Stain, made from pure ground colors, per gal 50c
*In 5 gal. lots only at this price.

Plumbing.

—Our plumbing department is exactly the same in variety as carried by any of the big "standard price" plumbing jobbers, bought from the same factories. But we buy in tremendously large quantities and at the same time take some seconds and slightly imperfect goods and get big reductions on regular prices.

—We make you the most exceptionally low prices as a result, so that no matter what you want in plumbing, from a $90 (regular) bath tub at $35 to a somewhat imperfect lavatory, the $7 grade at $4.

—Send us your plumbing list and we will show you in dollars and cents that it pays to trade with us.

75c Shingle Stains, 40c Gal.

—A special lot of shingle stains that we have secured in an unusual way and so offer them at about half price. Specially made for use in this climate. Choice of brown, yellow, red, and black. This price in 5 gal. cans only.

—This shingle stain is Railroad salvage from the recent floods, and on account of being wet many of the cans lost their labels and became mussed up, but the contents are absolutely O. K.

Lumber.

—A few items that should give you an idea of how you can save money **ORDERING BY MAIL** from us. We carry a full and complete stock of lumber, both rough and finished at all times, and will cheerfully send you our prices.

1x8 Redwood Shiplap, $22 per M.
1x4 Redwood Ceiling, $20 per M.
½x4 Plain Bevel Siding, $11.50 per M.
—The last item in 6 to 10 ft. lengths only and F. O. B. the cars at Los Angeles at this price. All of the above have been specially run through the mill from common lumber, especially for erecting outbuildings, poultry houses, etc.

No. 1 Redwood Shakes, $15 per M.
—Absolutely number one grade and measure 5 inches by 36 inches.

Windows—Doors—Etc.

—Our Sash and Door Dept. is one of the largest in the Southwest, and occupies one entire floor of our large main building. We have at all times, ready for immediate shipment, everything needed in standard sizes, sashes, doors, screen doors, front doors, etc., etc. **SEND FOR OUR PRICES BEFORE BUYING.**

$2.50 Woolnap Blankets, $1.40.

—Very fine grey blankets, have attractive colored borders at ends and are well finished, full bed size, just right for chilly mornings. Order early on this item, as we have only about 6 dozen blankets on hand.

Whiting-Mead Company

9th and Maple Ave., LOS ANGELES

Growers in the Mattole Valley, Humboldt county, are planning to double the acreage this season devoted to beans.

Great damage to the wheat and barley fields in Kings county is threatened on account of the high water in Tulare Lake.

A record price will be demanded this year for grain jute bags, Calcutta sacks now selling for 13½ and 14 cents. All of the sacks made at the State penitentiary have been sold.

Some 60 acres of tomatoes in the young citrus orchards of North Whittier Heights helped supply the Los Angeles and Pasadena markets until the rains of mid-January made them too soft.

The first cutting of alfalfa in the Ontario district will start about March 10. According to Chas. Johnson, manager of the Ontario Dairy farm, alfalfa was cut as late as December last year.

OLIVES AND NUTS.

The California Almond Growers' Exchange reports that the entire 1916 crop of almonds has been contracted for at prices to be named later.

Blackeye bean straw to loosen the top soil and melilotus clover to loosen the subsoil are being used by W. S. Herring in his walnut orchard near Covina.

Chas. G. Johnson, State Supt. of Weights and Measures, has just announced that containers or packages of olives in brine should be marked with a statement of the net weight of the olives, exclusive of the weight of the brine.

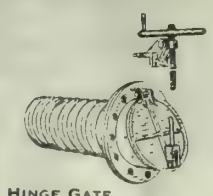
MISCELLANEOUS.

On March 4, State Market Director Weinstock addressed a meeting of Sebastopol fruit growers.

Chas. Teague of Fresno county has recently been granted a patent on a confection consisting of a fig and ginger preserve.

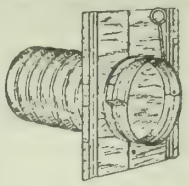
Correspondence courses covering the subjects of dates and corn have just been announced by the University of California.

It is reported that the Gartenlaub estate of Fresno has sold two fruit ranches, aggregating 800 acres, in Fresno county, to the Guggenheim interests for $200,000.

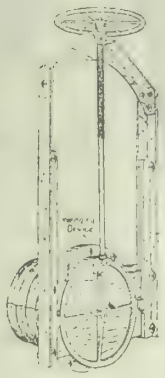


Los Angeles county will soon have fragrant and beautiful roads. Woven wire panels 16 feet long are placed along the paved roads five rods apart on alternate sides. Rose vines are planted along these and a few feet from each end. They will furnish jobs for men to prune, cultivate, and water them.

A shipment of celery was sent the State Market Director last Saturday by a Japanese truck gardener, for disposal in the open market. The sale was made immediately at $2 a crate, a commission of 10 cents a crate charged the shipper, and now the State Market Dirtctor's office has a bank account of 70 cents.



An agricultural bill has been passed by the House of Representatives appropriating $250,000 for fighting citrus canker; $2,500,000 for the foot and mouth disease; $250,000 for the investigation of cattle tick; and $200,000 for the marketing activities of the Dept. of Agri.



On the Phelan ranch west of Chico 84,000,000 bees are contained in 1400 colonies, under the care of J. T. Dunn, well-known bee man of Butte county. These bees are the property of the Garden City Apiaries, who hope to make this one of the greatest industries in northern California, and Chico the greatest bee and honey center on the Pacific Coast.

The Chambers of Commerce of all the cities throughout southern California have been requested by the San Francisco Chamber of Commerce to co-operate with the northern part of the State in making a strong protest to the Secretary of State at Washingon to intercede for the growers of California against the embargo act which England proposes on dried and canned goods.

WITH SCREW LIFT

The ledger of a progressive farmer

The Yuba Ball Tread Tractor is reducing the cost of plowing and cultivating for progressive farmers. Its ability to plow deeper and better makes it possible for the Yuba to increase your profits. The high grade material and skilled workmanship used throughout in its construction have gained for the Yuba a reputation second to none for durability and low operative cost. Progressive farmers are saving money! Are you?

PUMPING FLOODED ROADS.

[Written for Pacific Rural Press.]

In Imperial Valley, the roads are divided by a levee along the center, and when one side gets dusty in summer it is flooded from the omnipresent irrigation ditches. The other side is used until it gets dusty and so on.

But where roads cross the ditches, they are elevated too high to flood, so at least one of the several mutual water districts keeps a man to sprinkle these approaches through the summer. He drives about in a little automobile with a 1 h.p. Tom Thumb International gas engine clamped on behind. This runs a 1½-inch centrifugal pump by means of which water is sprinkled on the roads from the ditches.

This outfit became of use after the recent "unusual" rains which left some of the roads pretty badly flooded. The auto was driven to a convenient place, a hole and trenches were dug to drain toward it, a short hose with strainer was put into the hole, and a longer hose discharged the water into adjoining fields.

KEEP THE TRACTOR CLEAN.

A dirty engine is the cause of more engine troubles than practically any other one thing. This is especially true with the ignition system. It also cuts out bearings.

When you examine the bearings on the engine, be sure to clean off the top of the engine thoroughly, so that the dirt does not get into the crank and mix with the oil.

There are more bearings cut out from carelessness, by letting the dirt in, than from lack of adjustment where clean oil is used; but it is essential that the bearings be kept tight and the oil clean.

When the magneto does not give a good spark, the trouble may sometimes be found to be dirty platinum points. Clean them with fine emery cloth.

Dirty, wet or improperly insulated wires may cause ignition trouble.

Remove the spark plugs once in a while and clean them thoroughly.

Don't expect to get a good spark with wet cables, or wet and dirty spark plugs.

PUMP MAKES CHEAPEST IRRIGATION.

[Written for Pacific Rural Press.]

"Our pump makes irrigation water a great deal cheaper than the projects around us. And we have water when we want it, though the mountain streams go dry in June. Some of the other systems cost half again as much for the same amount. Last summer we irrigated 178 acres of lemons and sold some water at 75 cents per hour. The pump is a Layne and Bowler, about 8 stages, lifting water about 220 feet to the top of a hill. It develops 30 to 40 inches of water, being about 175 feet down in a 200-foot well. We figure that it costs about 25 cents per hour, including repairs, and with distillate at 6 cents, to pump with a 35 h.p. gas engine. This does not include the work of attending it. Last fall we burned tops instead of distillate. It worked nearly as well and was cheaper. We have never lacked water since we put down our 200-foot well, though we used to pump out a shallower well about the same place. We have never shut down on account of the pump. It has given splendid service." So pleased is H. L. C. Whitcomb of Corona. His only trouble has been that the packing around the shaft has usually been pretty well worn out at the end of each run, but this is due, he thinks, to the large quantities of fine sand in the water.

THE GAS MOTOR.

Gas motors may be either two or four cycle. The latter is more favored, especially for automobile and tractor motors.

A cycle means a complete operation done more than once. With gas motors, the admission of a fuel charge, its compression, explosion and expulsion constitute one cycle. In the two cycle motor this is accomplished in two strokes of the piston, or one complete revolution of the crank-shaft. The four cycle motor completes one cycle in four strokes of the piston.

The simplest way to learn the operation of the various parts is to follow them as they act through a complete cycle.

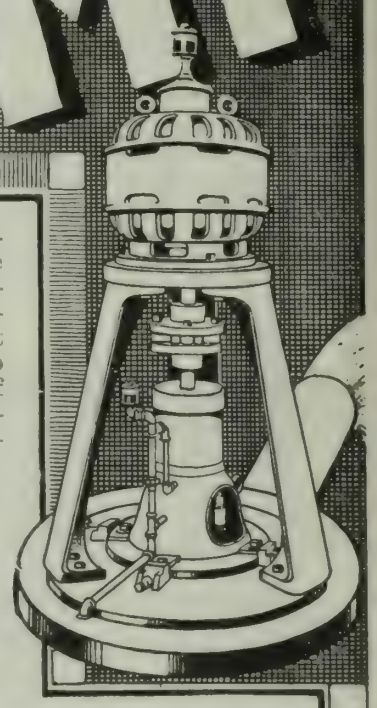
First Stroke—Intake or admission of fuel vapor: The movement of the piston away from the cylinder head causes the intake-valve to suck in a charge of fuel from the carburetor. In the single cylinder this suction operates the intake-valve, but in other motors the valves, both intake and exhaust, are operated by cams and rods. During the intake stroke, the exhaust-valve remains closed.

Second Stroke—Compression: The piston having reached the limit of

"After driving more than 10,000 miles, I couldn't find enough carbon to fill the hollow of your hand."

That motorist was writing about Zerolene. Practically all who use it have the same experience. That's because

ZEROLENE
the Standard Oil for Motor Cars



is made from selected California crude—asphalt-base.

Zerolene that gets into the explosion chamber doesn't "split up" into gummy, carbon-forming deposits, but after completing its efficient work, is consumed and passes out on exhaust.

Next time you empty the crank case, refill with Zerolene.

Standard Oil Company
(California)

Layne & Bowler PUMP

The development of water is no longer a gamble when competent water engineers assist you. When a reliable water system is installed it means a tremendous saving to you. Thousands of acres of growing crops have been utterly destroyed because of an inadequate water supply.

INSTALL THE
Layne & Bowler Pump

—and you have the most profitable investment possible—not a continual expense. Let the World's largest water developers solve your pumping problems. Pump for every requirement.

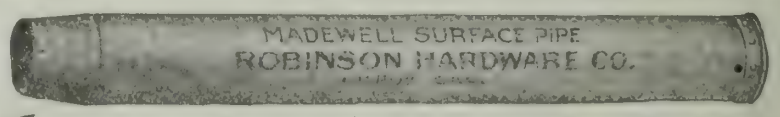
Catalog No. 25 on request.

Layne & Bowler Corporation

900 Santa Fe Avenue, Los Angeles.

FEARY-MILLER CO.

The KROGH Vertical Pumps



New Type Vertical.

Are automatically water balanced and require no adjustment of any kind. All weights of shafting and rotating parts are carried on the water film; absolutely without the use of thrust bearings or adjustment of any kind.

No BALANCE RINGS or PLATES in KROGH PUMPS. They are unnecessary, and mean only continual trouble. KROGH PUMPS with the least number of parts means less friction and greater efficiency.

Get our Bulletin No. 78 before deciding on a pump.

KROGH MNFG. CO.

Lock Seamed and Soldered

There is a tremendous difference in surface pipe. This is appreciated most by the man who has wasted time and money on inferior makes. If you want absolutely the strongest and best surface pipe you can buy, select

Madewell Surface Pipe

It has many distinctive important advantages you can't afford to overlook.

The Madewell Long Lock Seam is made doubly sure and strong by soldering the entire length. A better seam can't be made. The Madewell Lock Seam Sleeve—used in Madewell pipe only—is decidedly stronger and smoother than the old fashioned lap and riveted seam used in other pipe. This feature alone puts Madewell Pipe in a class by itself.

Send for Free Booklet—which tells just how Madewell Pipe is constructed

Robinson Hardware Co. Box B Gilroy, Cal.

its stroke, it returns toward the cylinder-head, compressing the fuel charge. Both valves are snugly closed. As compression produces heat, the fuel would ignite spontaneously if too great compression were obtained. Still a good compression is essential for full power development. To this end a nicely fitting piston and piston rings are of the utmost importance. Usually the charge is compressed to one-fourth its natural volume.

Third Stroke—Explosion or burning: Just at the commencement of this stroke, in which the piston moves from the cylinder-head, the timing device discharges an electric spark into the cylinder filled with compressed vapor. The spark ignites the fuel, which burns with tremendous rapidity, producing gases many times the volume of the original charge. These gases force the piston away from the cylinder-head and develop the energy or power of the motor. Both valves are closed.

Fourth Stroke—Expulsion: These gases are now expelled through the exhaust-valve and port by the return of the piston. The exhaust-valve is opened at exactly the right moment by the rocker-arm's pressure on the valve stem. The rocker-arm is moved by the push-rod, which is operated by a cam-gear driven from the crank-shaft. The intake-valve is held shut by the pressure of the gases and by a coil spring.

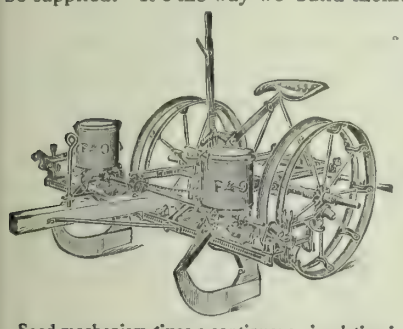
As actual motive power is only developed in one of the four strokes, it is necessary to have proper fly-wheels to absorb the excess power developed in the explosion stroke and distribute it over the other three.

In this single cylinder motor there are two fly-wheels, one of which acts as a friction clutch, which conveys the power developed by the motor to belt-pulley or drive-gears. Four cylinder motors usually have but one fly-wheel, which also acts as a clutch.

Essential Parts of Motors: There are ten parts of the motor which are of particular importance, viz: Fuel tank to give a constant supply of fuel at all times to the motor; a carburetor for mixing air and fuel to produce the most combustible vapor; a valve system to control the time and direction of gas movement; an ignition system for starting the combustion of the fuel charges; one or more cylinders for controlling the power developed by the burning of the fuel charge; a crank-shaft with a connecting rod for each cylinder to utilize the force imparted to the piston; one or two fly-wheels on the crank shaft to distribute the power evenly; a means by which the motor power can be used to operate other machinery or propel the tractor; an oiling system to lubricate all surfaces where friction (rubbing) occurs and a cooling system to keep the motor from getting hot.

PAY CASH FOR TRACTORS.

A tractor builder recently made the statement that the day is coming when the manufacturer cannot be both manufacturer and banker to the farmer who buys his products. This has always been one of the big drawbacks in the threshing machinery business, and there seems to be the same general tendency in that direction in the gas tractor business today.



Farmers who contemplate purchasing tractors should arrange with their local financial institutions to borrow money enough to pay cash for their machines. The man who pays cash for a tractor should and will get a lower price on it. The manufacturer has to pay cash for the labor and materials which he puts into the tractor. Selling on time means that he must command plenty of capital, which adds to the cost. Therefore, he can sell it for less money if he does not have to extend credit. The manufacturer is not essentially a banker and doesn't want to be; it is not his business.

The cash idea is a good one, and many manufacturers are promoting it. It will benefit the builder of tractors and the men who buy them. The fact that he can purchase a tractor at a lower price if he pays cash, should appeal to any business-like farmer and thresherman as a better proposition. — Thresherman's Review.

P & O

No. 40 BEAN PLANTER

Can be furnished for drilling beans (or corn) or as a regular check row planter, with check heads, wire, side reel, etc. It can also be equipped as a Bunch Drop Drill. Furnished with runners or disc furrow openers. A Fertilizer Attachment can be supplied. It's the way we build them.

Seed mechanism gives a continuous circulation in the hopper by means of an agitator, filling each seed cell properly and in time. We furnish an ample supply of bean plates, and a set of edge drop corn plates. Sight feed. Hopper can be tilted without getting the gearing out of time. Adjustable tongue bracket gives tongue adjustment for horses of different heights. Cushion spring between front and rear frame insures furrow openers working at uniform depth and absorbs the shock and jar of rough or cloddy ground. Quick detachable runners.

The different plates give any desired drilling distances, and as a Check Row Planter it will plant in rows of standard widths. As a Bunch Drop Drill it will plant 2, 3 or 4 seeds every 18 inches apart.

A Flat Drop Attachment can be furnished for planting smaller grains, such as milo maize, broom or Egyptian corn, Kafir corn, etc.

Beet Cultivator (K)

KILLEFER QUALITY

KILLEFER EFFICIENCY

The frame of this Cultivator is made of one continuous piece of high carbon steel with a truss connecting it to the main castings, supporting the two steering wheels. This construction makes a cultivator that is almost impossible to break down in the center and in consequence the wheels are always in line and under easy control.

The lower frame or tooth bar is from the same quality of steel with a strong arm at each end, which connects with the lifting rod, allowing no chance for the frame to dip or run deeper at the ends. The seat is set back far enough to give an unobstructed view of the rows. The foot control of the front wheels is adjustable with a turn-buckle for taking up wear, and is very easy on the operator. A lock is provided for the rear wheel that holds it rigidly in line except on the turns. This is the **strongest** and **best made** Beet Cultivator for sale on the Pacific Coast.

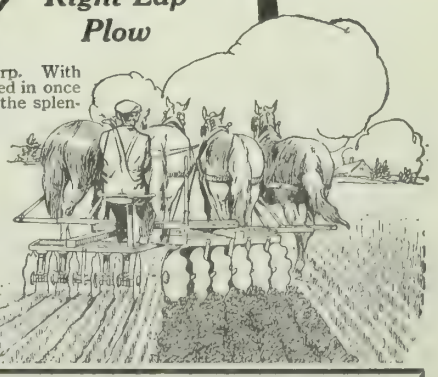
The Killefer Manufacturing Co.

2209-21 Santa Fe Ave. Los Angeles, Cal.

Pulverize as you plow

Use a Right Lap Disk Plow for the perfect seedbed.

Don't turn over the ground in lumps and chunks, but break up and pulverize the furrow ready for the seed when preparing



Stubble and Fallow Land

You cannot sow after the mouldboard plow, which leaves the land in chunks and a shiny hard furrow-bottom which the tiny plants are unable to penetrate. Use

Cutaway (CLARK) Right Lap Plow

the disk plow with the blades *forged* sharp. With seeder attachment, you plow, disk and seed in once over the ground. You'll be pleased with the splendid seedbed of finely worked soil. The seedling plants will like it too and pay you in the harvest. You can plow more acres at less cost. This tool in seven sizes. Also a hundred others. Ask your dealer about them and write for our free book, "The Soil and Its Tillage."

Special Live Stock Market Report.

An improvement in quotations on dressed meats together with a scarcity of lightweight cattle has caused a very strong demand for such cattle, buyers paying 6¾ cents in the country for choice lots. The Eastern markets shows a considerable improvement on medium grade cattle. The sheep situation is a waiting one, all of the feed lots being cleaned at this writing and but few supplies now coming from off the grass. A good many lambs have been contracted for Eastern shipment which will have a tendency to hold this market up. Mutton is scarce and while the grass run will soon start there are not many in the state and it seems probable that the mutton market will be strong all summer.

The hog market continues to soar in prices, receipts being light and the local demand heavy. Lightweights persist in finding their way to an unwelcome market, and are penalized as a result by packers, though in good demand by the butchers. Provisions are in good demand, and this is making packing concerns bolder in their buying.

WOOL.

The wool market does not look so favorable as it has for the past several weeks. The London sales for the last week show a 10 per cent decline in prices which has more or less dampened the ardor of markets in this country. Contracting in the country has apparently been suspended since our last report and buying is decidedly inactive, according to local wool people.

Buyers and Dealers Make Hog Squeal.

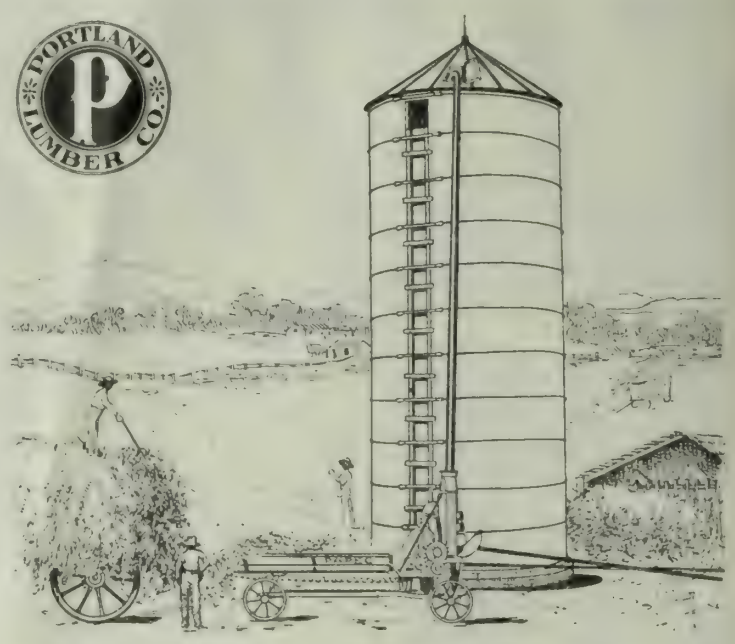
To the Editor: This from the standpoint of a small dairyman and swine breeder on a 50-acre alfalfa ranch. Hogs are quoted in San Francisco at eight cents. Does the farmer get that price here, less the freight to the city? Well hardly. The local butchers and buyers offer six cents delivered at railroad points and you may take it or leave it. A farmer having a dozen or so ready cannot ship to the city. Only in carlots is shipment feasible.

On the other side of the ledger the price of feed necessary for us to buy to supplement alfalfa is what? A reasonable profit to the dealer over what he pays the grain grower? Oh, no,—but the quoted price in San Francisco plus the freight from there, regardless of the fact that the dealers buy here, right in this immediate vicinity.

Now, you will say that the dairyman should buy his year's supply at thrashing time, but how many of us have the capital to do so, as that is only one item of the many supplies that must be laid in?

Should we desire a loan for this and other necessary purposes the local banks charge us 10 per cent for call or short time loans and eight per cent for loans secured by real estate; and the limit of these so-called long-time loans is one year. Barley is now $1.65 at the nearby railroad towns. What's the matter? —A Subscriber, Stevinson.

[Of course you know what is the matter—too much middleman, but that probably isn't what you wish advice about so much as to how to get around him without being stung.



In the first place, a two cents differential is an exorbitant commission charge for selling hogs, assuming that your hogs are the eight-cent kind. The freight rate on carload shipments from Newman, your nearest shipping station, to Stock Yards, San Francisco, is $29.50 for a 36-foot car. Such a car would hold 95 to 100 head of hogs, ranging in weights from 150 to 250 pounds, or say 19,000 pounds, live weight. The shrink in shipping live hogs would amount to eight to twelve pounds per head. Taking the latter named figure, the shrink on 19,000 pounds of hogs would be 1140 pounds, which if sold at eight cents would mean $91.20. This with the $29.50 freight charges would make a total of $120.70, or an average charge per pound of a trifle over one-half cent a pound, besides the loss of perhaps three days' time for one man to accompany the shipment.

As you say, it isn't practicable to ship small lots in this manner, so the best, and perhaps the only, thing for you to do is to show these figures to your neighbors and arrange to market your several small lots at one time via the carload route.

As to the grain dealers, your hogs as well as your alfalfa land will show a bigger margin of profit if you will entirely eliminate him as well as the highway money lender by raising your own feed. It is pretty well demonstrated in your county that the way to always have good alfalfa is to plow it up before it gets poor and that system goes fine with hogs. If you will plow up about 10 acres of old alfalfa each year and seed it to a summer crop, such as barley, Indian corn if it does well with you, or some of the sorghums, you will not only grow your own hog feed but will keep your alfalfa yield up to the maximum. Of course this also calls for the reseeding of ten acres again the next winter to alfalfa. Otherwise you would soon run out of alfalfa to plow up.

You seem to have pointed out "what's the matter" with our banking system. What we are trying to find out is when and how it is going to be changed.—Editors.]

Alfalfa in one silo and corn in another, or both mixed in one silo, is the common way of providing balanced succulence for dairy cattle in Wisconsin, according to Otto Baldenweg, who is now caring for a dairy in the Chino district.

A Simplex Silo Being Filled by Means of a Papec Pneumatic Ensilage Cutter.

Greater Profits Earned Through Better Feeding of Dairy Cows

Every good dairy farmer knows that the better he feeds his milch cows the more money they will make for him. Silage is the richest, most nutritive succulent food known to the dairying industry today—and also the cheapest. But there is good and bad silage, its quality being in exact proportion to the quality of the silo in which it is stored.

The Simplex Silo

yields the most nutritious silage simply because it is the best silo. You will recognize the Simplex as the best as soon as you learn of its exclusive features.

Simple—Airtight—Permanent—Economical.

The top is held in a perfect circle automatically—the doors are in sections easy to remove and operate—made of Oregon pine staves, absolutely the best silo material on earth.

The Papec Pneumatic Ensilage Cutter

The Papec Pneumatic Ensilage Cutter cuts the green fodder and fills the silo all at once. It throws and blows the fodder into the silo, using only one-half the power required by other cutters—and saving half the cost of operation.

Write for our FREE illustrated book, "Prosperity on Your Dairy Farm." It shows how the Simplex Silo will make money for you. And ask also for a complete detailed Papec Cutter Catalog.

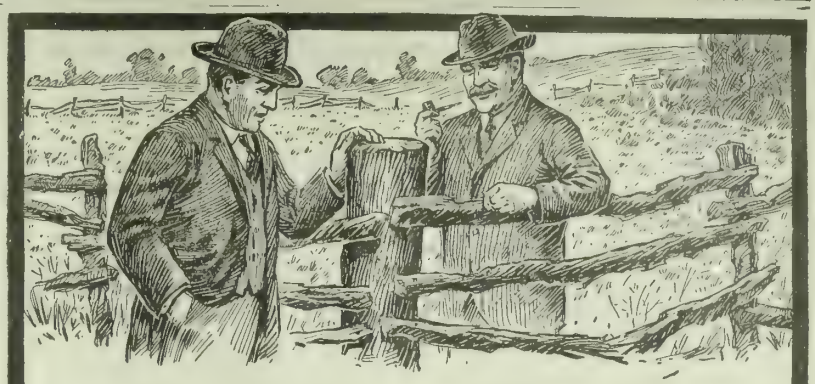
GRAND CHAMPION BREEDS SOON.

The Poland China grand champion Superba at Panama-Pacific, owned by W. H. Rough of Arlington, began breeding Nov. 23 and has bred 17 sows since that date. He is 3 years old this month and carries his 850 pounds beautifully on a back and sides without creases or sags, and on toes which stand up fine. His shields scarcely show at all. This boar has won 30 first prizes and 4 grand championships, including $625 in cash, and has traveled over 5,000 miles. He cost Mr. Rough $800 in March, 1915—$1,500 has been refused for him and $2,500 wouldn't buy him, says Mr. Rough, who is negotiating for three more of "the corn belt's grand champion sows" to breed him to.

One sow 22 months old had never been in heat, but was shut in a crate and force-bred to Superba late in January. She came around two weeks later and was bred again, this time successfully according to indications.

Superba was fitted for the Panama-Pacific after being received by Mr. Rough in July. High carbohydrate feeds were and had been used for two successive winning show seasons; but as soon as he was taken home from San Francisco, the carbohydrates were almost all taken away, gradually substituting bran, ground oats, alfalfa, and other protein feeds. He was kept hungry most of the time, but care was exercised not to reduce him so fast as to produce wrinkles.



Breeds Only Best Sows.—"I was warned that a former world's champion boar lost his prestige and reputation by being bred freely to common sows. The inferior offspring, advertised as sons and daughters of the grand champion, soon ruined his reputation. It was suggested that I should make the service fee so large that only the best sows would be offered."

RABBITS WITH EAR GUM DISEASE.

To the Editor: What causes rabbits to have sore ears; why does it spread so rapidly; and what is the remedy? This trouble starts close to the head.—G. W., Ripon.

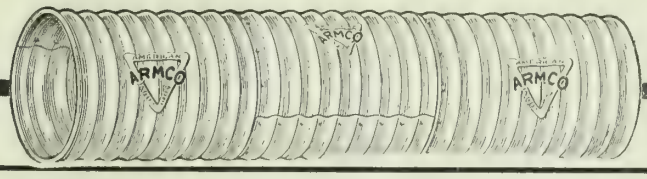
[Answered by Geo. H. Croley.]

[The ailment mentioned is most likely the ear-gum disease which is not yet prevalent in California, but is very troublesome in Europe. It is seldom fatal, but it is hateful because the pain and itching worry the animals. This worry naturally interferes with breeding or growth and the scabby sores that cling to the interior of the ears are displeasing. Many theories as to its cause and origin have been advanced, but none has been accepted by rabbit breeders as satisfactory It is generally believed that it is a parasite of some sort that is carried to the hutch in the hay, fodder or grain—perhaps in some one of the mildews. The following treatment is recommended by Meredith Fradd, of England, formerly vice-president of the United Kingdom Rabbit Club: "Drop a little sweet oil of almonds into the ears twice a day, until the sores are softened, and then remove them with a soft rag or sponge. Handle carefully to avoid pain and irritation, but if the ears become inflamed, dress them with finely powdered boracic acid, by carefully dusting over the affected surface."]

"Grandfather Set That Post

when he bought the land forty years ago. It's swamp cedar, and has lasted four or five times as long as common fencing stuff."

That's just about the difference between "Armco" (American Ingot) Iron and the ordinary galvanized material. "Armco" Iron is *pure* and *even*, like the old-fashioned nails, bolts and chains of a hundred years ago. Carbon, Manganese, Copper, Sulphur and the other rust-producing impurities are reduced to the lowest possible point.



"ARMCO" IRON CORRUGATED CULVERTS

give lifetime service because their base metal is the most highly rust-resistant iron on the market and because every detail of construction is in keeping with the high standard of their material.

(Continued from page 314.)

Dairy Buildings.—The milk-barns are built in 50-cow units, with a silo and feed room built into each pair of units. The feed room holds a week's feed, which is previously mixed in another building.

The silo was built square outside to match the buildings, though circular inside. It was found to be the most economical way to build a concrete silo, though the corners are solid concrete. The labor of fixing forms was reduced, as was also the reinforcement required.

The first unit of the milking barn has been erected. It has a concrete floor with three feet slope in 110 feet, draining to the fields by an eight-inch tile. The corrugated iron roof, concrete walls, and James equipment complete the fireproofness and sanitariness of the outfit. The mangers are cement with partitions easily removable for flushing. As the herd increases toward the 500-cow goal, other unit barns will be set side by side at uniform distances. Each one includes a separate room for the milkers' change of clothes.

A concrete creamery at convenient distance receives milk through a hole in the wall, runs it over a great Simplex cooler, and will separate and churn whatever is not taken by the hotel at Pasadena which is negotiating for the entire output of the ranch dairy. An 800-pound ice machine will supply cold storage and ice for the present. Individual motors run everything. The buttermilk and skim milk discharge outside the building into a concrete basin whence it gravitates through a two-inch underground pipe to hog pens.

A separate building at a short distance from the milking barn, but handy to the fields, is to contain an alfalfa mill, feed grinder, feed mixer and storage space for grain, beet pulp, and other feed. Below this is to be a paddock and concrete barn for 50 calves to start with.

Economical Hay Feeding.—Each string of 25 cows is kept in a separate paddock 200 by 520 feet, connected by a lane to the milking barn. In the line between each pair of paddocks and next to the outside end, is a corrugated iron hay barn 70x110 feet. Included on each side of this is a shed open-sided toward the paddock. The sides of the hay barn are tight except for openings for the cows under the sheds to feed through. They will first have to eat holes in the hay, and then a man will have to keep the holes filled. This will avoid all hauling after the hay is put into the barns, and will save the cost of baling. "These barns will pay for themselves in a year," says Mr. Taylor, who designed them.

Bulls Kept Handy.—Alongside the lane leading from the cow paddocks to the milking barn, are the service pens which open into the lane and also into the bull paddocks. When the milker turns his cows into the lane, if any are in heat, they may be turned aside into the service pens without loss of time.

The bull barn and paddock fences are all concrete, the capacity being for three bulls now, allowing a 75-foot paddock for each.

All of the cattle buildings and corrals are located high on a sandy slope where very little mud will ever accumulate.

A veterinary hospital with up-to-date operating table, electric water heaters, and all desirable equipment, is in charge of a resident veterinarian, who is kept pretty busy with all the livestock.

A concrete dormitory for 17 dairy workers is to contain all conveniences, including shower baths.

Outdoor Hogs.—The hogs are to be kept pretty much outdoors after removal from the ornamental concrete farrowing pens. They are located along a wooded ridge at lower elevation than the cow and horse corrals.

There will be at present 16 paddocks 200x400 feet ranged along each side of a 30-foot lane for convenient feeding. Pigs receive ground corn, barley, and skim milk as soon as they will eat.

Berkshires are preferred, but Poland-Chinas are almost as much favored. Breeding stock is selected for round medium type, heavy bone, to make 200 pounds at six months.

Horse Departments. — The horses are kept near the cattle; stallion houses and paddocks being separate from the mares, but all located among beautiful trees. They are the direct charge of F. L. Dickson.

Stallion paddocks used to be separated by a single high woven-wire fence; but continual warfare made necessary an alley way between.

Mares are kept outdoors practically all the time, having a hay-feeding shed in each 2-acre paddock, open on three sides. A 25-acre pasture is also available close to the barns.

All horses are worked, to keep them in good health. Jusque works in double or single harness on the

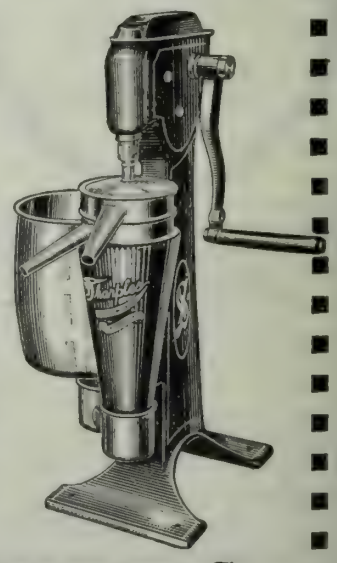
Cream Fed Pigs

Are you feeding cream to the pigs? You undoubtedly are.



In the morning you feel fresh and strong; you turn your separator at full speed. At night, you're tired and don't turn quite so fast. You also stop a moment to refill the supply can; the speed slackens and some cream escapes into the skim milk.

Your separator may skim clean at full speed, but, no matter how good the machine, it will lose cream, and a lot of it, when the speed slackens. Many dairymen are losing a hundred dollars or more every year through imperfect skimming. They are feeding cream to the pigs. A marvelous but simple invention now enables you to stop this loss—stop it absolutely. The saving is clear "velvet"—more profit without added expense. You get *all* the cream with

THE NEW
SHARPLES
SUCTION-FEED

Separator. Whether you turn faster or slower than the regulation speed, the bowl of the Suction-Feed *drinks in just the right quantity of milk* to insure the closest possible skimming. Does away with speed indicator, which is not a protection against cream loss.

The New Sharples Suction-Feed has many other important advantages. Turn fast or slow, you secure smooth cream of an even thickness. No more streaked butter from mixing different grades of cream—no more dissatisfied customers.

The capacity increases when you turn faster than the normal speed, so you can get through quicker when in a hurry. The large, seamless supply can is only knee-high. The entire machine is made simpler and better than ever.

Send for our new book, "Velvet for Dairymen," which fully explains how you can save the cream now going to the pigs. Also ask for our liberal *free trial* offer. Do it today, before you forget. Address Department 31.

wagons and the mares haul hay, manure spreaders and other road work; but are not used much on plowed land, though Mr. Dickson says that would be all right until two weeks before foaling time.

It is better for them to foal in the pasture in good weather, than in a stall, especially if they are accustomed to the field. Any change in conditions at that time, such as putting them into a boxstall, makes them nervous.

Brood mares are fed bran and rolled oats before and after foaling, without change. If working hard, they get less bran because it would be too loosening to the bowels. Colts learn to eat without the mothers as soon as they want to, and are weaned at about six months; sooner if the mother is not in good condition.

The main mistake that farmers make," says Mr. Dickson, "is that they don't feed a foal enough of the right kind the first year and they can never make up the loss when this is done."

Business Management.—The work of the whole ranch is divided into departments such as thoroughbred horses, draft horses, dairy cattle, hogs, water supply, vegetables, "ranch" (which includes the fruit and feed crop growing), etc. Each department is in charge of a man who is directly responsible to Mr. Taylor. The bookkeeping system is complete so it will show the monthly profit or loss in each department, and where the leak occurs.

Recently Begun.—The improvement work was scarcely started on this ranch a year ago, and most of the cows have been bought since last September. Official tests were begun on Dec. 4 when Mr. Sturgis came; most of the permanent buildings have been erected within six months and more will follow. The best swine were bought since October, and some of the best draft horseflesh has been on the ranch less than two years. Great things are still doing, and the ranch next year will look very different from what it does now.

Parks and Lawns Everywhere.—The whole place is being parked with lawns, shrubbery, flowers, and trees. Deer are kept in a separate enclosure, and calla lilies ornament the creek banks. Hedges of evergreens and roses, and palms will line the driveways, and everything will be done to put visitors in a happy frame of mind.

FURTHER EXPERIENCE WITH PIEMELONS.

As a result of our request for information regarding the citron or pie-melon as a feed for hogs, E. C. Hoover of Turlock has the following to say:

"Regarding the feeding of citron or pie-melons to brood sows will say that I have fed my sows freely of them for the past four years and never experienced any bad results except once when one sow farrowed a litter of pigs dead. I think from my experience that the trouble came from not feeding any other food in the ration and feeding the citron too freely after they got rotten.

"I consider alfalfa hay an excellent feed in connection with citron. The litter of pigs I lost was born late in February and after a cold winter for this valley. This year I fed my purebred Duroc sows very freely of citron and pumpkins up to their farrowing time (feeding only sound citrons) and had excellent results. I heard considerable complaint the year I lost the litter, one man claiming he had lost five litters.

"In conclusion would say that I would advise caution in feeding the citrons, but think that if fed carefully they will materially reduce the feed bill. At Turlock we raise our hogs almost exclusively on the waste melons, cantaloupes, pumpkins, sweet potatoes and such like for about eight months of the year."

PEACH KERNELS FOR HOGS.

To the Editor: What is the food value of the kernel of the peach pit for hogs?—H M. H., Parker, California.

[Answered by Professor F. W. Woll, University Farm, Davis, California.]

[Kernels of peaches, apricots, prunes and other fruits contain a glucoside that yields appreciable quantities of hydrocyanic (prussic) acid on maceration of the crushed seeds in water; viz., over 2 per cent of the oil extracted or distilled from the kernels. It would, therefore, be dangerous to use them as a feed for hogs or other farm animals in any large quantities. The press-cake or kernels from which the oil has been extracted can, however, be safely fed to stock and will make a valuable feed. It is high in both protein substances and starchy components (N-free extract) and has doubtless a high digestibility.)

YOU'LL BE SURE OF THE
Best Silage and the Longest Service
WITH

THE IDEAL GREEN FEED SILO

IT IS NOT A LOW PRICE that makes a silo worth buying. It is the quality of the silage you will get out of it and the number of years the silo will last.

YOUR SILAGE MUST BE WELL PRESERVED if your cattle are to thrive on it. You cannot make good silage with a cheap make-shift silo. Such a silo cannot be kept air and water tight, and unless it is, poor silage will result.

THE LEAST EXPENSIVE SILO TO BUY and the most profitable one to own is the Ideal Green Feed Silo. It produces the very best quality of silage and gives you the longest service.

EVERY DETAIL IN THE MAKING OF THIS SILO is fully explained in our large silo catalog. Ask for a copy and read it. You will then see how carefully the material is selected; the staves milled, spliced and fitted together and secured against the tremendous pressure of the silage; how the staves are treated on the inside with a preservative that protects them most effectively against the acid in the silage.

EVERY SUPERIOR FEATURE OF THE IDEAL is the result of long experience in the process of manufacture. There is nothing mysterious about the extra value you get in the Ideal. Everything is fully explained in the catalog and will be clear to you when you investigate. Write for the catalog today.

THEY HAVE GRAND CHAMPIONS BEHIND THEM.

With the Live Stock Men.

DAIRYING.

During February, the Modesto creameries shipped $100,000 worth of creamery products.

The Ferndale Cow Testing Association will employ three testers this summer if enough cows can be secured.

The Handorf Dairy is milking about 160 cows which are being fed green barley, moist beet pulp, chopped alfalfa, and pasture.

Mr. Frank P. O'Connor has been appointed superintendent of the Arden Dairy, El Monte, to succeed Mr L. Mooney.

E. F. Kirtley of Holtville has a very fine Jersey which has a test of 7 per cent; he is aiming toward a registered herd.

The Yuba City Creamery, which has been closed for some years, will open shortly with a capacity of 2000 pounds of butter daily.

McAlister & Sons of Chino report the sale of the Holstein bull, King Korndyke Sadie Vale 23rd, to F. Stenzil of San Lorenzo.

W. J. Higdon of Tulare recently sold Guernsey bulls to: Harry E. Weaver of Tulare; Mrs. C. L. Powell, Los Angeles; and C. O. Butler of Hanford.

At the El Centro Fair Grounds on March 15, Geo. A. Smith of Corcoran will offer for sale 30 registered Holstein heifers, 30 registered Holstein bulls, 50 registered Poland-China sows, and 25 registered Poland-China boars.

Big Holsteins have never bloated on alfalfa pasture for Chas. H. Snell of Ontario, but small Holsteins and Jerseys do unless carefully watched. He has been pasturing 7 cows and 40 head of young stock all winter on 80 acres and less of alfalfa.

Morris & Sons Corporation and S. Lawson are establishing at Woodland one of the finest milk plants in northern California. It will be strictly up-to-date in every particular, containing pasteurizing, refrigerating, and ice cream and buttermaking machinery. The plan is to buy milk and sweet cream and ship to San Francisco, as well as to supply Woodland with milk, cream, butter, buttermilk, and cottage cheese.

F. A. Heraux has recently purchased 30 acres near Salida and is getting a fine start with purebred Holsteins and Duroc-Jersey hogs. His foundation for his Holsteins are 3 heifers and one bull purchased from the Hazelwood Farms of Spokane, Wash.; also two Holsteins from the Carnation herd at the P. P. I. E. He purchased from C. A. Hoover of Gervais, Ore., one bred Duroc Sow and from Elmer Lamb of Ceres, his choice sow, Queen of Stanislaus.

We are informed by the American Jersey Cattle Club that Merry Maiden of Innesfells 307454, owned by Dr. J. F. Thompson of Portland, Maine, has broken the world's butter fat record for one year. She averaged 8.13 per cent fat for 365 days. Merry Maiden started test at four years, four months of age, under the supervision of the Maine Agricultural College. The final results show that she produced 560.4 lbs. fat or 659 lbs. 85 per cent butter from 6,896.5 lbs. of milk.

HORSES AND SWINE.

The Berkshire breeders will hold a consignment sale at Davis on May 6th.

The French government recently purchased 200 draft horses in Shasta county, valued at $28,000.

Ruby & Bowers of Davis, horse breeders and importers, state that they have sold 72 head since the Exposition. A carload is also being shipped to Arizona this week.

A start in registered Poland-Chinas has been made by E. A. Parkford of Ontario, who recently paid $40 each for three bred sows as a foundation.

Lee Bros. are new ranchers in the vicinity of Holtville and are ones who believe that registered stock is the best kind for them. They have a fine herd of Duroc swine.

The State Swine Breeders' Association has under consideration the holding of an auction sale in connection with the Butte County Fair to be held in Chico May 21 to 28.

Hogs in the walnut orchard have proved profitable for W. R. Rowland in Los Angeles county, according to his ranch superintendent, L. A. Meredith. They do not hurt the trees.

John P. Daggs of Modesto writes that he now has 120 pigs, two weeks old, which he will have ready for the 1916 State Fair. He states that he has sold 44 head of his hogs during February; and will shortly send 10 head of weaned sow pigs to E. W. Smith of Milford Valley.

"The Berkshire Farm" is being established by C. B. Ford near Ontario. The present mixed stock is to be replaced gradually by the offspring of two registered Berkshire gilts and a son of Improver B bought last September from the Cloverdale ranch of Ontario. G. Robb has charge.

Irvin H. Reimers, Supt. of the Wylie M. Giffen ranch of Merced, states that he has just purchased the best ten sows of the John Decker & Sons' Duroc-Jersey herd at Turlock. The ranch contains 640 acres of land along the old Mariposa Creek and was formerly called the "Old Stockton Ranch." The hogs purchased are the start of their purebred Duroc herd which they intend to enlarge gradually.

On March 4, Tulare county swine breeders met at Visalia and organized the Tulare County Swine Breeders' Association, electing J. L. Nickerson of Visalia temporary president and Arlington Smith, Visalia, temporary secretary-treasurer. The meeting was addressed by Dr. B. J. Cady of the U. S. Dept. of Agri. and Dr. C. H. Roadhouse of the University.

CATTLE AND SHEEP.

F. Niboli will offer at auction at the Palm ranch, near Brawley, 80 head of cattle, 35 heifers, and 4 bulls.

J. G. Hankins of Elko, Nev., recently shipped another trainload of cattle to Oakdale, Stanislaus county, to pasture during the spring months.

Th highest price ever paid for wether lambs in the Sacramento Valley was received recently by Fred Mendosa who sold to a San Francisco firm, for $5.50.

P. Connolly and Jas. Gallagher, Jr., of Livermore have contracted their young lambs to the Golden West Meat Co. of Oakland for $5.35, to be delivered during April.

Mendocino cattle growers report more damage from the severe cold winter than any other section, one grower bringing 250 head down from the high points to keep them from starving.

The shearing of 15,000 head of sheep pastured on the desert near Maricopa, Kern county, has begun. Sheep on the West Side this season have done exceptionally well and the owners anticipate big profits.

The sale of the California Development Co. which supplied water for Imperial county was recently completed as part of an arrangement by which the ranchers could obtain control. W. H. Holabird, the receiver for six years, recently asked the court for $6,000 additional to the $1,000 per month he has been receiving for his services. His attorney on company business was awarded $10,000 in addition to over $11,000 attorney's fees already collected by him. The attorneys for the trust company for the bondholders were awarded $50,000 for their services. Who pays the bills?

BLATCHFORD'S PIG MEAL weans easily and safely; no trouble; no milk. Write for free folder, "The Safety Route from Pighood to Porkage." Coulson Co., Petaluma.

CROLEY'S BALANCED PIG FEED for growing youngsters; also cheaper hog feeds for big hogs. Geo. H. Croley Co., Inc., 631-637 Brannan St., San Francisco.

REGISTERED PUREBRED BERKSHIRE PIGS—Weanlings—both sexes. Reasonable prices. Write for full information. J. E. Hall, Sebastopol, Cal.

POLAND CHINAS—Large type. Prize-winners. Gilts, service boars, bred sows. Satisfaction guaranteed. A. J. Robinson, Route A, Modesto, Cal.

REGISTERED IMPROVED CHESTER WHITE BOARS for sale from prize-winning stock. S. R. Cheney, R. 2, Lindsay, Cal.

DUROCS OF QUALITY—Predominating bloods of Defender, Buddy Ky, Crimson Wonder. C. T. Thompson, Bishop, Cal.

The newly established Palo Alto Stock Farm is rapidy being put in shape for the 600 head of registered Holsteins and Guernseys which the 600-acre ranch is to support. Mr. Tichenor, the manager, has purchased the remaining members of the Lathrop Guernsey herd and has also purchased a small-sized herd of Holsteins from Miller & Lux. There are about 70 head of purebreds on the ranch at present, but this number is to be materially increased as soon as the dairy barn and milk house are completed, which will require another two or three weeks.

DR. FAVILL.

Bertram D. Scott, manager of the Dirk Dairy Farm, writes in memory of Dr. Henry B. Favill, of Chicago, who died of pneumonia on February 20th, at Springfield, Mass., as follows: "Dr. Favill, at the time of his death, was connected with many agricultural organizations, among them the National Dairy Council, of which he was president, the Holstein-Friesian Association, of which he was vice-president, and the National Dairy Show, of which he was a director.

"Progressive agriculture in general, and breeders and dairymen in particular, never had a more generous friend, a more able and energetic champion. Of powerful and charming personality, he was one in a million. We of California are equally in his debt, wherefore it is only fitting that we should join the balance of the country in paying tribute to his memory."

SWINE.

LITTLE BLACK ESSEX—Service boars and weanlings. Only herd in the State. Limited supply. Yolo Essex Herd, L. W. Millsap, Yolo, Cal.

DEL DAYO FARM (Old Haggin Bottom Ranch)—Breeders of registered Berkshires. Both sexes for sale. Stephen A. Day, Box 1140, Sacramento.

CALIFORNIA'S SILO HISTORY TO DATE.

(Continued from page 313.)

and I notice the cows prefer good corn silage to the vetch and barley or oats. Alfalfa alone as silage in my opinion is not a success; there is not enough sugar to preserve the feed in a palatable form and I threw out over 100 tons of alfalfa silage three years ago. For winter feeding, corn silage and alfalfa hay in my case produce a good flow of milk for months and I can count on a regular quantity, day after day, with no fresh cows and no ups and downs, due to a change in feed. The cows stay steady, even during the cold weather, and show very little decrease in November, December and January, over the months of early fall. I had one complaint two years ago when feeding a very poor, acid silage, of tainted milk, but I did not change the feed and heard nothing more of it. The best silage is made from corn thoroughly ripe and dry, cut fine, and packed tight with plenty of water added. I also add some salt. I seal the top of the silo I do not feed off of immediately, by blowing up two or three bales of straw, adding water and sowing to barley. This prevents all loss. I store enough feed in these two silos to last 50 cows about six months; by filling twice a year I am never out of silage. I have fed corn silage out of the pit in my resaw silo when nearly two years old and it was in perfect condition. There is no drain in this pit, and although the silage was very wet it was in good condition."

In the Interior Valleys. — After two years' experience with a silo on the Poppy Ridge Ranch in Sacramento county, where a high grade of city milk is the chief consideration at all times, Ralph Newman, owner and manager, finds these advantages with a silo; First, a first cutting of alfalfa saved what would otherwise have been a total loss. Second, ability to store a large amount of feed in a small space. Third, succulent feed during months when alfalfa is dormant.

On the other hand, he has found the vile odors of alfalfa silage prohibit its use on his dairy. He also finds difficulty in getting the cows to take to silage—even the best corn—quickly, stating that "the fussy ladies make a decided drop in their milk while making up their minds to like the feed."

Ralph Watson, manager of the Rancho Dos Rios in Stanislaus county, is more optimistic. He says, "Of course there is a certain amount of care that must be given in keeping any kind of a wooden silo in shape, but as for real disadvantages, I am sure we have been unable to find any. On the other hand we could write several pages on the advantages of the silo to us and feel sure our cows would be very glad indeed to add a few words for themselves. The condition of our cattle after a hard, wet winter with short rations of poor hay show what the silo has done for them, to say nothing of the returns from the cream. I firmly believe that every dairy should have a silo large enough to give 30 to 40 pounds silage per day per cow for at least eight months in the year. It will pay."

Going further down in the San

A Silo is a Permanent Investment---

not a tool to be replaced in a few years.

Its continuous and lasting efficiency is of paramount importance.

Fruit in a cracked jar will not keep; neither will silage in a leaky silo---for exactly the same reason.

Redwood Manufacturers Company

1608 Hobart Bldg., San Francisco

Joaquin valley to Tulare county we have this advice from R. F. Guerin: "The silo," he says, "has all of the advantages and none of the disadvantages. As I see it, it is a most wonderful thing for a farmer, especially for a dairy farmer. Silage is a fine winter feed and when fed in connection with alfalfa hay in the winter the cows do well when green feed is an impossibility. My 14 by 32 foot silo furnishes two feeds a day to 25 cows for five months in the year. It has been built four years and my silage keeps perfectly. I plant the large Indian corn and cut it when it is just hard enough to eat. I do not let it get hard, and find that it makes very fine feed that way as all of the stalks and blades are green. I know most every one lets their corn get riper than I do, but I tried it both ways and find that with the green corn there are no dry sticks and blades in the silage and that it is all juicy and nice. The cows completely clean up the mangers when I feed it, whereas when I had the older corn they would pick out the soft juicy parts and leave the other. The silo is the only thing for the dairyman to my notion."

In the southern part of the State silo progress has been equally as marked as in other districts and the evidence is equally as favorable.

In Southern California. — C. W. Main of Riverside county has two silos on his dairy. His suggestions about alfalfa silage are both timely and convincing. He says that alfalfa should be wilted a little before siloing; otherwise it will become slimy, mushy and sloppy. Where it is badly infested with foxtail it can be siloed greener than when pure. If wet in shock he puts into silo pretty wet, but if wet on ground he allows it to dry a little more, but when put into silo too dry it does not pack well and does not ferment as it should. If cut in the morning with dew on, it should be raked in the afternoon in clear weather. Last year he cut one day and raked the next, but it got too dry. It was half foxtail, and dried foxtail never does make much feed.

Before starting to feed his alfalfa silage Mr. Main was feeding his cows all of the alfalfa hay they wanted plus pasture, but could notice no change in the milk flow when he started feeding 15 pounds of silage twice daily with the hay. The odor was not offensive and there was no more waste than with corn, which is used as a silage crop except when the alfalfa will not make good hay. Properly put up, he believes it compares favorably with corn as far as palatability is concerned, although, of course, it hasn't the same feeding value.

In face of the above facts, recited by practical feeders, as well as similar words of praise from others which space forbids the use of, we believe the first chapter of silo history in California has about been written, namely: The Introduction.

How long it will take to add the remaining chapters is problematic. If enthusiasm is any indication of progress, then we may expect succeeding chapters in much less than four-year intervals.

IS SILAGE A PICKLE?

To the Editor: I am interested somewhat in building a silo but haven't fully made up my mind regarding the benefits to be derived from silage. I have been told by dairymen who ought to know whereof they speak that silage is extremely hard on the cow's stomach; that the feeding of silage shortens the life of a cow to a considerable extent. Is this a fact? At one of the farm center meetings in our county, I asked our county farm adviser for information regarding the above and was advised that silage was no harder on the stomach of a cow than pickles might be on the writer's stomach. Were I to accept his answer as given I must infer that silage is very hard on the cow's stomach, as pickles are very hard on my stomach, and I believe that most authorities on diet agree that pickles are hard on the human stomach. However, I consider his answer no answer at all. I shall be greatly obliged for enlightenment.—E. F. S., Hughson.

[There is no comparison between silage and pickles, for pickles are nothing but preserved cucumbers, and it is generally conceded that cucumbers are hard to digest.

On the other hand, silage is made from field crops such as corn, alfalfa, sorghums, etc., having high digestible and nutritive values for livestock and the chemical processes that occur in the silo during fermentation make the material more digestible, and are supposed to be almost identical with the changes that take place in the stomach of the cow. The effect is to break down the fibrous substance and render it more soluble.

In view of this, as well as corroborating advice from silage users, which appears in other columns of this issue, it is fair to assume that your informants are mistaken as to the "burning out" effects of silage. Of course it is unwise to feed spoiled silage, just as it is unwise to feed spoiled feed of any kind to dairy cows, and we don't doubt but what a continuous ration of spoiled silage would shorten a cow's life, just the same as spoiled food would shorten your life.—Editors.]

Which Will You Buy

A "Cream Thief" or a "Savings Bank" Cream Separator?

WITH a great many machines or implements used on the farm it doesn't make much difference which of several makes you buy. One may give you a little better or longer service than another, but it's mostly a matter of individual preference and often it makes little difference which one you choose.

Not so with buying a cream separator, however.

There is a big difference in cream separators.

The most wasteful machine on the farm is a cheap, inferior or half worn-out cream separator.

The most Profitable machine on the farm is a

DE LAVAL Cream Separator

A cream separator is used twice a day, 730 times a year, and if it wastes a little cream every time you use it it's a "cream thief," and an expensive machine even if you got it as a gift.

But if it skims clean to the one or two hundredths of one per cent, as thousands and thousands of tests with a Babcock Tester show the De Laval does, then it's a cream saver, and the most profitable machine or implement on the farm—a real "savings bank" for its fortunate owner.

But cleaner skimming isn't the only advantage the De Laval user enjoys.

There are many others, such as longer life, easier turning, easier washing, less cost for repairs, and the better quality of De Laval cream, which, together with its cleaner skimming, make the De Laval the best as well as the most economical cream separator.

If you need a De Laval right now there is no reason why you should let its first cost stand in the way, because it may be purchased on such liberal terms that it will actually pay for itself out of its own savings.

A De Laval catalog to be had for the asking tells more fully why the De Laval is a "savings bank" cream separator, or the local De Laval agent will be glad to explain the many points of De Laval superiority. If you don't know the nearest local agent, simply write the nearest De Laval main office as below.

Poultry for Profit---Producing and Marketing.

THE FARMER'S POULTRY.

[By Mrs. Susan Swaysgood, Pomona.]

Farm poultry ought to be more profitable than it is, judging from what I hear and see. In Missouri and Kansas the bulk of the eggs that are sent to market are produced on the farms and only a short time ago the loss from unsanitary conditions, poor systems of marketing, etc., was enormous. But the farm bulletins and poultry departments in farm papers have educated the farmers till now Missouri stands first in poultry produce, both in quality and quantity.

While California can show more specialists, or egg farms, perhaps there is neither as much poultry—that is table poultry—nor eggs produced on the farms. This may be because we have a great deal of land given over the fruit growing, and as the fruit grower does not raise any grain he naturally concludes there is not any profit in poultry.

Poultry in Orchards.—This is a mistake, for there is a double profit in poultry to the orchardist. A good flock of hens that are fed just enough to make them rustle will produce eggs from many things that if not destroyed will be a pest, and nearly every one can grow a little green feed to help out so that the feed bills need not be large.

I never advocate the starvation plan of keeping poultry, but where hens have range it is folly to overfeed. Let them rustle for a part of their living; they will have better health and if eggs are to be hatched they will be more fertile and give stronger chicks.

During the spring months when there is moisture in the ground and plowing is being done the hens that range will get considerable animal food in the way of worms, bugs, etc., but after the warm, dry weather sets in it is good-bye to the bugs and the hens should then be fed a little animal food, either milk or commercial beef scrap. Milk pays better if fed to poultry than if fed to hogs.

Green Feed.—It is surprising what an amount of feed can be grown on a little land if water can be had for irrigation, and by making the proper choice the same things can be grown for both the kitchen and the poultry. The best heads of lettuce can go to the table and the poor ones to the hens; the heart of the cabbage goes to the table, the leaves to the hens, and so on with everything. Use the ear of corn for the table and put the leaves and the stalk through a feed chopper and mix with a little mash mixture and the hens will make a good meal of it.

There is enough waste from the average farm to feed a hundred hens that will average under fair treatment from 40 to 50 eggs a day. I am not going into very high figures, because people, that is some people, jump to conclusions too quickly. But given ordinary care and feed, any flock should average 40 to 50 per cent; and if a part of the eggs are used at home and the rest sold the flock will more than pay for the investment, even at that rate.

There is no reason why the California farmer and fruit grower cannot make as much money on poultry produce as the Kansas farmer. Land may be cheaper there, and they can grow grain cheaper, but they have not nearly so good a market; they do not get as good prices for their products and they have to feed their flocks through the long winter months when hens do not produce any, or at least very few, eggs, while here, nearly any farmer can fix things so that the hens will lay fairly through the winter months when eggs are a good price.

THE YELLOW EGG PERIL.

To the Editor: My cousin loaned me some of the money that was needed to establish my little poultry business. He has asked me if there is still some danger of the Chinese eggs ruining the poultry business of this State. The question gave me quite a shock and the more I think of it the more I am frightened. Can you tell me something of the situation at present?—J. S., Napa.

[Answered by Geo. H. Croley.]

The latest report issued by the U. S. Dept. of Commerce includes the figures up to Dec. 1, 1915, and covers all the imports and exports for the entire United States exclusive of Hawaii, Alaska, and insular possessions. This report records the following:

Imports of Eggs.

For 11 months of 1914: 4,976,091 doz., valued at $825,725.

For 11 months of 1915: 1,812,244 doz, valued at $260,484.

For the month of Nov., 1914: 309,206 doz., valued at $38,340.

For the month of Nov., 1915: 40,069 doz., valued at $8,899.

The above figures should certainly have a soothing effect on the nerves of our troubled inquirer for they indicate that the imports of eggs from all sources have dropped to a trifling sum as compared to the total production of this country.

While we are on the subject let us see what we have exported:

Exports of Poultry, Game, and Eggs.

For 11 months of 1914: Eggs, 17,641,660 doz., valued at $4,195,330.

For 11 months of 1915: Eggs, 16,450,040 doz., valued at $3,691,707.

For 11 months of 1914, poultry and game valued at $833,137.

For 11 months of 1915, poultry and game valued at $1,379,172.

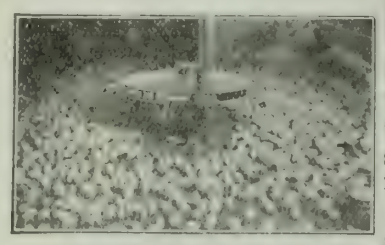
A total for 1915 of $5,070,879 against that of 1914 of $5,028,467, a net gain of $42,412.

We might state that a considerable portion of these exported eggs were shipped to Australia, which has a protective tariff against us of 15 cents per dozen, and to New Zealand, which has a tariff of 5 cents per dozen.

We believe that public opinion is now so strongly set against the use of Chinese eggs that it will be many years before they again seriously menace the industry of this country. It seems to us that the future for the California poultry keeper was never as bright as at present.]

LIME AND SALT FOR EGG PRESERVING.

To the Editor: I have lost my volume containing the recipe for putting down eggs in lime, salt, and water Please repeat it; I want to put some down while eggs are so cheap.—Subscriber, Napa.



[Answered by Geo. H. Croley.]

[We suppose our correspondent refers to the method of preserving eggs which is described on page 153 of California Poultry Practice and which we reproduce as follows: Quick lime 16 ounces, table salt 8 ounces, and boiling water one gallon. Pour the boiling water over the lime, stirring well to keep from burning, add the salt, and stir until it quits boiling. Allow the mixture to settle, which may take a day or two, then draw off the clear solution and pour over the eggs packed in earthenware crocks. The eggs must be well covered and weighted down or the top layer will not be good.]

Animal food—meat scrap, bone, etc.—in some form is required, more or less, during the entire year.

Mites differ from hen lice in that they hide in the cracks and crevices (near the roosts especially) of the henhouse during the daytime, and swarm out on to the bodies of the fowls at night, to suck themselves full of blood.

The Home Circle Page of the Pacific Rural Press

THE GARDEN YOU DON'T HAVE TO TAKE CARE OF.

Of course that caption must not be accepted altogether literally. There is precisely no garden that need not be taken care of. But a great many people like to have a garden who do not wish to be forever attending to it. They would welcome a combination of plants that makes a good appearance and that requires the minimum of attention. It is purposed to present here a number of helps toward such a garden.

To begin with the plot can be given an aspect of stability and improvement by the judicious placing of a few trees. One of each of the four or five favorite kinds of acacias may be planted if the yard is large enough. A dracena palm grown too large for its pot may be set out, too. The acacias flowering will give the yard a "gardeny" appearance.

Of shrubs and things of that nature, rhododendrons, bamboo, fuchsias, hydrangeas, oleander, agaves, laurustinus, lavender, breath of Heaven, Scotch broom, and Spanish broom will give you no trouble. Save the fuchsias, hydrangeas and the bamboo one need not worry about irrigation, since they will get along where the rainfall is about 20 inches. But everything that grows will thank you for some water.

Of vines, this is a flourishing selection: passion vine, clematis, honeysuckle, jasmine, Australian pea vine, wistaria and iron vine.

Roses are always worth while, though they need some looking after, and ample water. But here are things that seem to rustle for themselves generally: geraniums, marguerites (single and double), pelargoniums, Shasta daisies, lemon verbena. The geraniums and single marguerites may get along with rainfall.

These can hardly be prevented from growing, and under the most neglectful conditions: hollyhocks, shirley poppies, sweet alyssum, gail lardia, calliopsis, cosmos, marigolds, nasturtium, and German iris.

Very little care will suffice for petunias, stock, wallflower, coreopsis, snap dragons, foxglove, gladioli, mignonette, violets, sea pink and hens and chickens.

Sweet peas to flourish properly require plenty of attention, before and during growth, to obtain good ones. But it is surprising what tolerable results are obtained by the most primitive cultivation.

Calla lilies may be said to take absolute care of themselves, except that they are entitled to watering and weeding to live.

THIS WEEK'S BEST HOUSEHOLD HELP.

To save tainted meat—If a piece of fresh meat has a bad odor after being kept over night, it may be kept from spoiling by washing it off in a quart of water to which a half teaspoonful of powdered borax has been added. Then rinse in fresh water and wipe dry with a cloth. At this stage the taint is only on the surface and may be neutralized as directed. It is best to cook the meat immediately afterward, since it will keep better cooked.

MAKING UP FOR WHAT HE MISSED.

By Fred Schaefer.

Grandpa, back in other days,
had gobs of work to do;
From the hour that he quit
school his work seemed
never through;
Up before the hired man, to
bed when like to drop,
He kept a-pluggin' on at
work and never dared to
stop—
He never dared to stop at all
to keep up with the times,
Commerce, weddings, wars,
politics and crimes—
Until he got his chance with years; and now he sits and reads,
And reads and reads and reads and reads
And reads.

EXPERIENCE EXCHANGE.

J. T. S., Goleta.—Yes, burlap is used for a wall covering quite often instead of wall paper where a dignified decorative effect is sought. Different shades of tan, brown, green and gray are obtainable.

This from R. D., Dinuba, ought to interest all who have a place in their heart—and stomach—for the raisin: For a tasty raisin sandwich chop a cupful of seeded raisins to a smooth paste and then spread on bread that has been buttered thinly.

For the benefit of Elise G. of Salem, Ore., who asks if we have ever heard of the game, "Whose Nose?" will say that we find that it is not a card game. "Nosey" is a card game in which the penalty for the loser is a rap on the nose with the cards held in his opponent's hand. "Whose Nose" is a party entertainment, the audience attempting to guess the owner of a nose thrust through a slit in a curtain. Usually the company is divided into two sets, one on each side of the curtain, each side taking turn in guessing at someone from the other.

A FEW NOVELTY NOTES.

(By Rosabella Best's Step-Sister.)

I like the patent leather purses that have come out with the strap handle and with the silver mirror, powder box, and salts bottle inside. I paid $2.95 for mine.

What made a hit with me was a 3-piece suit of black taffeta silk with a white lace collar and embroidered chiffon trimming and chiffon sleeves.

They've a striped cotton crepe middy blouse for misses, with a little broad-brimmed hat of the same material to go with it, $1.50 for the set.

I think the midnight blue, in taffeta and wool, will be the favored color. It looks well trimmed with chiffon and silver.

I see some velvet corduroy sport suits in blue and in rose.

They showed me a canary yellow taffeta silk negligee at $19.50 that was so beruffled that I didn't like it. So au revoir. **Mary.**

THE OLD MAN ON THE CRACKER BOX SAYS:

By Fred Schaefer.

Every man grows a moustache once—just to prove he can do it.

Mother is the supreme court of every well-regulated household.

Many people don't look upon gifts from the farm as much, but in reality they're the same as money.

A country boy's notion of a hero is a teamster who can drive a ten-mule team and make the wheelers jump over the chains.

Every once in a while Daughter puts one over Father, and Mother is an accomplice.

A DON'T FOR THE EAR.

One of the most sensitive and delicate organs of the whole human body is the ear. The ear is much neglected, and also much abused. It is "doctored" by amateurs too much. One thing that ought to be avoided is putting home remedies into it, and applying poultices to it. About all that an ear doctor ever puts into the ear is hot water, which he does to remove the debris of the dozen or more things that misguided people have put into it. Don't fool too much with an ailing ear. If it really ails, see a doctor. One treatment usually suffices, and it doesn't cost much.

A "GERMAN PANCAKE" TO RAVE OVER.

(This Week's Preferred Recipe.)

This is probably the most delicious and digestible form in which eggs may be prepared for breakfast, and it is a viand that no one ever tires of.

An ordinary portion for two people is made of four eggs, a pinch of salt, and a tablespoonful of flour wet with a bit of milk to rub the lumps out; all these beaten together until light and frothy, and one cup of milk added and beaten again. Pour this into a hot greased skillet and cook over a slow fire. Both sides should be browned. To do away with turning the pancake set the skillet under the broiler burner, if you have a gas stove. This pancake ought to puff up two inches. It may be eaten with jams, jellies, or syrup.

MRS. BEST'S BULLETIN.

My dear Friends:

I am convinced that you are absolutely certain to be in fashion this spring if you wear anything that wasn't sold last fall. Wearing something sold just recently, in fact, is the foundation of fashion.

The reason I say that anything will be O. K. is that the new things are so vastly assorted in colors and weave and patterns and even in cut.

It seems as if the things each store is featuring are things that the other stores haven't even heard of. One store plunges heavily in new shades of taffeta silks. Another goes in for gowns of Georgette crepe, another for wool sport suits, another for every conceivable degree of shepherd checks, another for black silks, and so on.

And the funny part of it is they are all absolutely correct.

They may not be president, but they are right.

The high cry just now is for silks. This is going to be prominently a silk year. Middle West prosperity (that is really reaching here) probably raised the idea that the buying public will wish to plunge on purple and fine linen.

You can get sport silks that are very crepey in either the rich colors or the black and white.

You can get taffeta silks in strange new figured patterns, from the most bizarre shades to the popular blues and blacks and the black and white stripes.

The chiffon taffeta is believed by many dealers to be the leading fabric of the season.

Underskirts in taffeta or crepe de chine in the gayer colors are coming to the fore, with extra flares and cording and petals to aid in giving the overskirt the proper "set."

Some khaki-colored walking suits in whipcord fabrics are seen at $25 to $30.

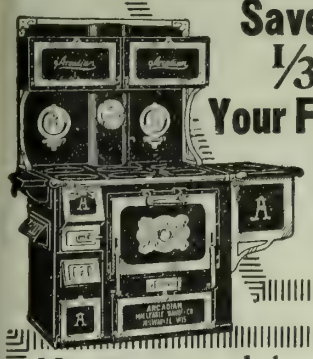
Hat trimming of all kinds appears to be partial to perching on the top of the crown.

Gloves with colored stitching and borders—blues, tans and greens usually—are being offered.

Shoes are being shown in even more colors than lately. Some have openwork insteps to show the tint of the stocking through.

Not to be scorned by the tidy housekeeper are breakfast sets—cap, jumper and skirt—of calico and gingham. Prices range from 95 cents to $1.50 for a set.

Striped cretonnes for window curtains may now be had in such combinations as blue, green, yellow, black; or terra cotta, brown, yellow, black and purple.



Saw a novel hat with a double brim of shadow lace.

Now having dressed you from top to toe, I think I will leave you to look at yourself in the glass.

Approvingly, **Rosebella Best.**

No Change. — The secretary was very busy on account of several new pupils being enrolled in Sunday school one morning, and in order not to miss anyone she said to little Johnnie, "Oh, yes, you are the new little boy, aren't you?" To which he replied in all earnestness, "No, I'm the same boy."

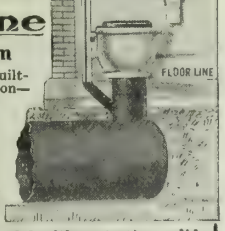
Stays a Perfect Baker and Saves 1/3 Your Fuel

Most any range bakes well for a while, but to *stay* a perfect baker, year after year, this is what you want. To *stay* a perfect baker it can't have its joints stuffed with stove putty to crumble out and let in false drafts.

Arcadian Malleable Charcoal Iron Range

This range is riveted metal to metal, air-tight without the use of stove putty, and stays air-tight year after year. This is why it stays a perfect baker and saves 1-3 your fuel bills, wood or coal.

Write for booklet that tells inside facts about ranges—learn how to judge range values—FREE.



ARCADIAN MALLEABLE RANGE CO.
Dept. 18 Milwaukee, Wis.

ENJOY FAMILY HEALTH AND COMFORT

Why force each family-member to exposure of rain, storm and the cold?

You may now have a comfortable, sanitary toilet right next to your bedroom, off the kitchen—anywhere. And there's no filthy, noxious odors—even in summer—no disease-breeding atmosphere, when you use the

Kaustine Closet System

It's a permanent, built-in-the house installation—as neat and attractive as any city toilet. Endorsed by health authorities everywhere.

No cesspool, water, sewer or plumbing—simply Kaustine, a powerful germ-killing disinfectant—surprisingly inexpensive.

If you seek economical health-protection, solid city-comfort and cleanliness, write for beautiful booklet—write today and state whether interested in system for home, school, factory or church.

Kaustine Co., Dept. 1134 Buffalo, N.Y.

THE HOMELAND.

By Dana Burnet.

My land was the west land; my home was on the hill,
I never think of my land but it makes my heart to thrill;
I never smell the west wind that blows the golden skies,
But old desire is in my feet and dreams are in my eyes.

My home crowned the high land; it had a stately grace.
I never think of my land but I see my mother's face;
I never smell the west wind that blows the silver ships
But old delight is in my heart and mirth is on my lips.

My land was a high land; my home was near the skies.
I never think of my land but a light is in my eyes.
I never smell the west wind that blows the sumer rain—
But I am at my mother's knee, a little lad again. —Literary Digest.

TREASURED GRIEVANCE.

Anthony Trollope, the English novelist, who was for many years a valued official of the post office, was once made to realize in an amusing way the occasional blessings of a grievance to the aggrieved. It was a part of his duty to investigate complaints, and the department had received so many and such irate letters from an Irish gentleman in a remote village of County Cavan, that he was at length dispatched to visit the complainant.

It was midwinter, and Trollope arrived at dark, chilled to the bone, after a long drive in an open jaunting car through a sleety snowstorm. He at once began to explain his errand; but the Irishman, observing that he was wet through, hastily sent the butler for a hot drink, began peeling off the investigator's coat, and suggested that he should go up to his bedroom before troubling himself about business.

"Bedroom!" exclaimed Trollope.

"I wouldn't turn a dog out on such a night as this—and yourself a man and a gentleman," was the reply.

On coming downstairs, warmed within and without, and attired in dry borrowed clothing, the novelist tried again—in vain. Business must not be talked at dinner. After dinner he must hear the daughter of the house sing. After she had sung, his host was too sleepy for affairs. The next morning breakfast must not be spoiled by a discussion; and when, after breakfast, Trollope insisted that they really must discuss things, the genial host "wrung his hands in disgust, almost despair."

"But what am I to say in my report?" persisted the representative of the post office.

"Anything you please?" cried the Irishman gayly. "Don't spare me if you want an excuse for yourself. Here I sit all day—and I like writing letters."

That was all there was to it. Trollope reported his hospitable entertainer as "now quite satisfied with the postal arrangements of his district," but with a distinct sense of ingratitude in robbing him of his grievance.—Youth's Companion.

Consoled.—A rector in South London was visiting one of his poorer parishioners, an old woman, afflicted with deafness. She expressed her great regret at not being able to hear his sermons. Desiring to be sympathetic and to say something consoling, he replied, with unnecessary self-depreciation, "You don't miss much." "So they tell me," was the disconcerting reply.—Kansas City Star.

Pacific Rural Press Market Report

PRICES QUOTED AS PAID TO PRODUCERS.

EMBARGO REDUCES DEMAND FOR DRIED FRUITS.

THE market is just now decidedly panicky over the English embargo on dried fruits. It is announced that anything shipped up to Mar. 4 will be admitted, but that later shipments will be rejected, which will mean the closing of the largest export market to the old crop. What will be done in the fall, when the 1916 stock is offered, is still somewhat uncertain, and indeed there is still a possibility that the embargo may be lifted. Stocks remaining in this country are not unduly large for this time of year, and it is hoped that the domestic demand will absorb everything. Values have accordingly been maintained, except for a further drop in prunes, which a good many holders are getting anxious to sell. Prices, however, are almost entirely nominal at the moment, as there is practically no buying whatever, and will be very little until the packers know where they stand. The only articles in which a surplus is at all likely are prunes, peaches and apples. The shortage of imported figs is causing increase in future supplies from California.

A later report from London states that licenses for importation of dried fruits, may be issued after Oct. 31, allowing one-half of the quantity imported last year.

San Francisco, March 8, 1916.

WHEAT.

The Eastern markets fluctuate so fast that it is hard to keep in touch with them, but this influences local values only in a general way. Of late the tendency has been a little easy, on reports that Russian wheat might soon be released. California Club shows another slight decline, and the demand for all grades is limited.

Cal. Club, ctl.	1.65	@1.70
Northern Bluestem.	1.85	@1.90
Northern Red	1.85	@1.95

BARLEY.

Trading in this market has been light for the last few days, most sales being of a small jobbing nature, and the principal demand is for feed for current needs. Values are unchanged.

Shipping, ctl. $1.40	@1.42½
Choice Feed, ctl ... 1.32½	@1.35

OATS.

The movement of oats here is limited, and no large quantity is required for feed; and while stocks are not heavy, values show little strength, except on the better grades of white.

Red Feed $1.35	@1.37½
Red Seed 1.45	@1.65
White 1.50	@1.55
Egyptian 1.50	@1.55

CORN

There is nothing new in Eastern or California yellow. Offerings of inferior sorgrum grains are quite large, and such stock will not bring full prices, though first-class grain is salable at the quotations shown.

Eastern yellow, ctl. ...$1.80	@1.85
Milo Maize 1.40	@1.45
Kaffir 1.65	@1.70
Egyptian 1.50	@1.55

BEANS.

Few Eastern shipments have been sent out recently, and dealers report practically no inquiries at present. Dealers still feel confident that the demand will come, however, and aside from a slight decline in bayos, values hold fairly steady.

(On wharf, San Francisco.)

Bayos, per ctl. $4.60	@4.70
Blackeyes 3.40	@3.50
Cranberry Beans 4.75	@4.85
Horse Beans 3.25	@3.50

HAY.

Arrivals of hay continue very large at this time of the year, owing to the releasing of a great many cars; but the shipments are beginning to fall off now, and will probably be much lighter from now on, as stocks in the country are getting well cleaned up. With supplies in the country as small as they are, a firm market is expected from now on, though the consuming demand is much lighter than it was.

No. 1 Wheat $13.00	@16.50

BUTTER.

The local trade is not yet certain as to what is really required by the storage law, and continues to hold off. The effect of this, however, has been nullified by a sudden spurt in all the Eastern markets, which has attracted shipments of California butter amounting to probably nearly twenty carloads, greatly reducing supplies for the home market. This has naturally brought a sharp advance in local prices.

EGGS.

The egg market was rather depressed about the end of last week, but is now picking up a little, with storage buyers coming into the market. Eggs suitable for storing have so far been a little scarce, and a local packer has been offering 21½ cents on the Exchange for storage pack. This demand is expected to keep the market fairly steady on about the present basis for some time.

CITRUS FRUITS.

The eastern auction prices on oranges and lemons are still below normal owing to poor quality of fruit and large supply. However, it is believed that these conditions will soon be overcome and normal prices paid. At New York on Monday, March 6th, navels averaged from $1.20 to $3.15 per box, and lemons $1.70 to $2.40. At Chicago the same day navels averaged from $2.50 to $3, lemons from $2 to $2.50 per box.

The San Francisco demand for oranges has been decidedly slack for the last few days, and supplies are rather heavy, though values are well maintained. Lemons also are inactive, and lemonettes are easier.

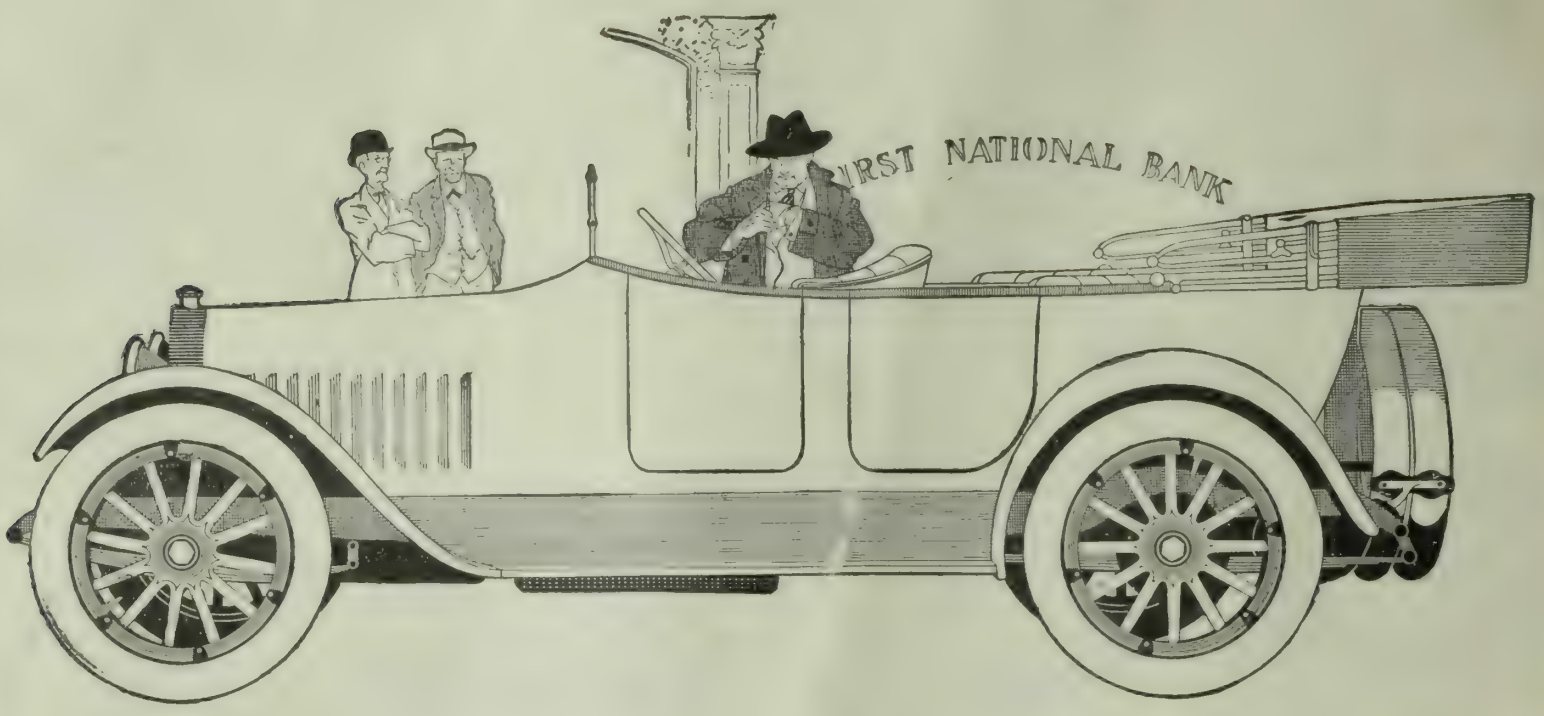
Knapp Engine Disc Plow

With this plow you can work within one foot of the trees in throwing the soil from the trees. Built very low, so that no part can come in contact with the limbs of the trees. Will penetrate hard soil and will not jump or swing round. Will turn under and completely cover up any cover crop or foul growth NO MATTER HOW HIGH OR HOW THICK.

WILL NOT CLOG UP IN PLOWING BUR CLOVER OR VETCH, as it has a wide clearance.

NO LEVERS to come in contact with limbs, as the land and furrow wheels are provided with worm-gear lifts, which does away with the levers and makes the plow easy to raise or lower.

TURNS EITHER TO RIGHT OR LEFT, and is steered by the engine as well as by hand.



The seat is in the center of the plow to keep the driver away from the trees, and all operating rods are within easy reach from the seat.

MADE IN ALL SIZES to suit every size and make of tractor.

WRITE FOR ILLUSTRATED FOLDER.

H. G. KNAPP & SON

1022-1036 S. First Street San Jose, California

This is the New 3400 r.p.m. Chalmers: 45 H.P.; 2660 Pounds—the Price $1050

600 merchants, who sell a great many thousand cars every year, took one look at this new 3400 r. p. m. Chalmers and bought $22,000,000 worth in forty minutes.

Perhaps half of them came from county-seat towns, some from smaller communities. They took almost half the Chalmers output.

That means about 10,000 of the new 3400 r. p. m. Chalmers are going on the farm.

The other half will go to the cities, which for eight years have absorbed the greater share of Chalmers production.

You can stand on Fifth Avenue any day and watch a million dollars' worth of Chalmers go by. Stand on Jackson and Michigan Boulevards, Chicago, and you will think half the city is riding to work in Chalmers.

Minneapolis, Boston, St. Louis, Kansas City, San Francisco, Cleveland, Detroit, daily show the Chalmers conquest.

Now comes this new 3400 r. p. m. Chalmers; up goes the demand, new buildings, production. And down comes the price to $1050.

That is $300 less than any Chalmers model ever built before, and some $900 less than the Chalmers of three years ago.

The hundreds of Chalmers dealers who sell a great many cars to farmers every year have bought more than $10,000,000 worth of these new cars because $300 saved is $300 earned, and $300 is six per cent. on $5000.

They bought so heavily because they knew, as good merchants, that this was a good-sense kind of a car for a farmer to drive. It develops 45 horse-power at the usual cost of 25 H. P. (And gasoline isn't getting any lower).

The engine is rather small beside the big hulk of an engine it used to take to turn up 45 horse-power. The cylinders are 3¼ x 4½—six of them. But they deliver the stiffest wallop that ever came out of an engine of its size. It "turns over" 3400 revolutions per minute, or better than 56 a second.

You understand the "kick" that is back of speed. Some cars do 1400. Some 1800. Some 2200. Others 2400. One or two get around 2600; one reaches 3000 r. p. m.

But this is the highest engine speed ever developed in an American stock car.

It means great power from a small engine; a light-weight chassis; quick acceleration; long mileage on gas; abnormal tire life; and ability to pass your neighbor almost at will.

One minute with your foot on the accelerator makes you want to own the car.

When you go to town again look up the Chalmers dealer; and send for a catalog now.

Military Precision in Frost Fighting.

Though the exact practices described are practiced by citrus growers, their lessons are clear also for deciduous fruits and other crops endangered by spring frosts.

[Written for Pacific Rural Press.]

AFTER the freeze of 1913, citrus growers invested in frost-fighting outfits by the wholesale. Now that we have had no serious troubles since then, people are prone to forget, and to allow their equipment to rust out or to provide insufficiently against repetitions of the disaster.

It is never too soon to begin planning preparedness, for equipment may have to be ordered months ahead, and construction of reservoirs and pipe lines may be more convenient now than later.

One of the orchards designated by the Fruit Growers' Supply Co. and others as being best prepared for a big freeze is that of the Arlington Heights Fruit Co. of Riverside, whose 44,000 firepots of several makes are protecting 554 acres containing about 50,000 lemon trees. This orchard extends about six miles along the foothills.

"I think we have everything well in hand," says Supt. F. A. Little. There are three main divisions divided into 14 districts over each of which a certain man has charge of the lighting.

The main features of the defense equipment, aside from the smudge pots and torches to light them are: (1) a half-million gallon steel tank 200 feet above the orchard from which an 8-inch screw pipe runs the oil down to a lateral across the upper end. The aim is to keep oil enough on hand to fill all the pots three times. From this lateral a 2½-inch pipe runs down the various streets and delivers oil at two convenient faucets on each 10 acres. (2) Twenty-eight tank wagons of 350 to 500 gallons, from which oil is distributed by hand to the pots, using 5-gallon oil cans. (3) A dozen telephones, from which to report temperatures and conditions, and to receive orders for lighting. (4) Reliable thermometers at significant points, maximum and minimum thermometers, and three recording thermometers from which the charts are removed once per week. (5) A book for each of the three main divisions in which daily temperature records are kept, as well as half-hourly records or oftener during nights when smudging is in progress. These records help form judgment of when or when not to light the fires.

Snow-capped mountains on the rim of the Redlands citrus district. The cold air currents from these mountains make frost fighting preparedness a good investment.

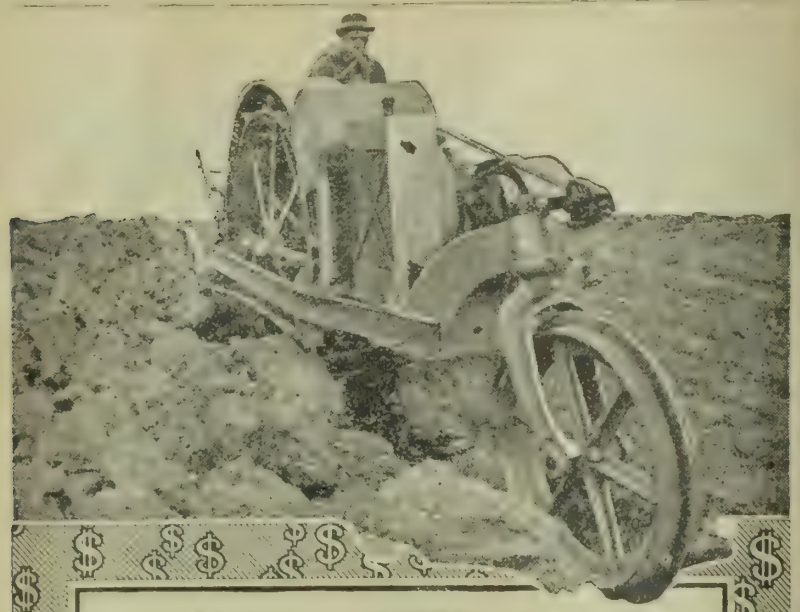
A deciduous orchard, well supplied with frost fighting equipment to guard against spring frosts which sometimes do great damage.

Men Required.—To light up the whole outfit quickly on a cold night would require 145 men, all of which are available, besides teamsters, who are not called out except as a last resort, because they have to work on the refilling next day. Most of the workers are instructed and trained in lighting fires.

Placing and Lighting Pots.—The smudge pots are placed, one per tree for five rows (in colder blocks for seven rows), then one row is vacant. The pots not used in the vacant rows are placed outside the orchards in cold spots where the customary air currents will carry heat and smoke over the trees. The pots are set level to avoid spilling oil which damages the trees and reduces the capacity for long firing.

The torches hold four to eight quarts of a mixture of half distillate and half gasoline. In the spout is an asbestos wick, around which has been wrapped a piece of fine copper wire netting. When the mixture has moistened the wick, it may be lighted and is then ready to light about 300 pots. This wick is loose enough to allow drops of the burning mixture to fall onto the smudge oil and there is practically no danger of explosion. Men have crossed ten acres lighting 30 pots in four minutes. The average time is 5 or 6 minutes.

It takes the same time to put out the fires by closing the dampers and putting on the covers. New pots are harder to light, so a piece of sacking is put into each just touching the oil. This acts as a wick until the surface oil is heated enough to generate gas.



Distributing Oil. — The tank wagons are filled from the faucets in 2½ to 3½ minutes and driven down designated and previously pruned rows to fill the pots. When the ground is soft and rough it may require four mules even on the smaller size; but the hauling is easier in the designated rows, and the breaking of branches, less. The same rows are used to haul fertilizer and fruit.

Seven men per wagon fill five rows of pots at once, emptying the tank in 20 to 25 minutes. Meanwhile a full tank has driven up and the men get busy emptying it while the first returns for another load. Whenever any oil is spilled, the oily dirt is at once put into a box on the tank wagon and later dumped outside the orchard.

Telephones Necessary.—Telephone central, to which temperature reports come on cold nights, is located centrally in the largest area likely to be cold.

"To light up intelligently, we must have prompt information regarding temperatures. On some nights the variation of the temperatures along the six miles is astonishing. In the past, on cold nights when smudging was done, it was uncertain what had been accomplished; but now we have the means of information in hand. That means intelligent control; it may mean not to light up, which would save oil and that means money; it may mean light up and

THE BULL WITH THE PULL

Mogul 8-16
A Real Kerosene Tractor

ON and after April 1st, the price of the Mogul 8-16 tractor will be $725 cash f. o. b. Chicago. All bona fide orders received up to April 1st will be accepted at the present price of $675 cash f. o. b. Chicago.

We are making this announcement early so that our thousands of friends who are thinking of buying Mogul tractors will be posted on future prices.

After all it is not the **price** a man pays for a tractor which is of the most importance, **but what its power costs. A Mogul 8-16, burning kerosene, in five thousand hours of work will more than save its original price over the cost of the same power produced by a gasoline tractor.** Remember the **Mogul 8-16 is a real kerosene tractor,** planned and built originally for using this cheap, plentiful fuel.

This readjustment of price is of minor importance compared with the wonderful saving which a Mogul 8-16 will make. It is necessary owing to the advance of prices in the raw material market. There is no change in the original policy to sell the Mogul 8-16 at the lowest possible price, always maintaining Mogul quality, but materials are almost unobtainable, even at an advance in price of from 50 to 100 per cent over prices of a few months ago.

Orders placed at once will stand the best chance of being filled in time for spring work. **See the Mogul 8-16 dealer, or write us.**

Farmer Stenzil's Ranch of 1000 Wonders

How waste on one of California's most diversified farms has been eliminated to the minimum by the addition of livestock to its activities.

[Written for Pacific Rural Press.]

HIS Portuguese help call him "Boss Stenzil," he signs his name F. Stenzil, but the writer prefers calling him "Farmer Stenzil," because, if we may be pardoned for using an antiquated term, "he's a farmer from the ground up." He has an office just next to his garage, one befitting in outside appearance the thousand-acre farm he reigns over and situated in just the right place to allow familiarity with all of the ranch's operations. What that office looks like inside the writer is unable to say, for while he spent the best part of a rainy day with this "Farmer Stenzil," he didn't see the interior of it. To add to his curiosity about that office, as he was being driven to San Leandro to take the car, the driver let slip this brief advice, "He's got a big man's job, all right. During the busy reason he's in the saddle from morning to night bossing the 200 hands he hires." Now, we reasoned, if he isn't in that office in the busy season nor on rainy days in the dull season, just what use does he make of it?

4th. Right Top—Back View of milking barn and corral. Right Bottom—A two-year-old heifer just fresh. Left Top—Future Herd Prospects. Left Bottom—Farmer Stenzil and his office. Center—Marie Clothilde De Witt

Holsteins Were Lucky.—We found Mr. Stenzil leaning against a feed bin in his dairy barn, a big, fine, well-ventilated and well-lighted structure, with cement floors and steel stanchions, the last word in sanitation and convenience. "That is right," he afterwards confided, "it cost money. There's ten thousand dollars stuck around here somewhere in it and the milk house. If it hadn't been for that, though, I might have quit the dairy game one time when both myself and milkers were being just about pestered to death with a fool inspector from the city."

That was one time the Holstein breed was lucky, for this Farmer Stenzil breeds purebred Holsteins just like he farms, constructively. "Feeding a boarder is the most disheartening job I know of," he told us, and that typifies the man. He's not only a large farmer, but probably the most diversified farmer of his size in the United States and everywhere he eliminates waste to the last degree.

His implement shed is just one illustration of his abhorrence of waste. In building it a floor was laid on top of the rafters, providing a storage space for hay over the implements, thus making the roof serviceable for two purposes instead of one.

No doubt it has been this utilization of small things that has made Farmer Stenzil a pyramider of land, for he has builded a thousand-acre farm near San Leandro, Alameda county, with an average valuation of a thousand dollars an acre, from a foundation in '88 of 250 acres worth $225 an acre, and, in his own words, "Every acre and every improvement has been purchased with profits from the farm."

It is not surprising, when you know the man, that he started his dairy to eliminate waste. For over 20 years he had been buying land and fitting the most suitable crops to it till now his farm is cut up in this manner: 150 acres to pear and apricot orchards, 75 acres of currants, 75 acres of rhubarb, 50 acres of peas, 100 acres of tomatoes, 150 acres of barley and a like amount of grain hay, besides 75 acres of alfalfa, 25 acres of stock beets and some wild pasture land.

If you can imagine the supervision required to farm such a large acreage in such a diversified manner as those crops demand, then you won't wonder that the writer asked, "But why, with all these vast interests to look after, did you assume the additional responsibility that was certain to came in breeding registered Holsteins?" Neither will you be astonished, after what we have already told you, at his reply.

The Deciding Point.—"Well, sir, I guess the incident that was the deciding point with me was a 150-ton lot of hay I sold to a Swiss dairyman. You see we used to have trouble some years selling the hay we grew on the low spots of the ranch. When there was plenty of hay in the country I had to beg fellows to buy it. This dairyman agreed to give me ten dollars a ton and when he came to pay me he handed me a check for $1500, the creamery check for one month's cream from his herd of 80 cows. That set me to thinking. It'd set anybody to thinking wouldn't it?

"We'd always had about 20 cows on the place, just scrubs, you know, to furnish milk and butter for our own use, but they weren't handled right. Then we started to sell cream. That made me appreciate a good cow as I never had before. It taught me that you can't show much profit with poor stock. You see how quick this Farmer Stenzil detected the leak? In less than six months after he started his dairy for the purpose of eliminating his waste with hay, he found another leak, poor cows, and by June, 1911, he had sent a mail order to New York for 30 registered Holstein heifers and two registered bulls. "That was the best buy I ever made," he assured us; "the poorest purebred is better than the best grade I ever owned. My herd average is right around four gallons a day per cow, while Blank's grade herd over there doesn't average but three gallons a day to the cow."

"But how, without previous experience, did you select a herd intelligently by mail?" we asked, for we couldn't by this time imagine Farmer Stenzil doing anything blindly. "Did you consult some experienced breeder?" we continued, for we had one or two theories we wanted to confirm. "No, I didn't consult anybody. Fact is, I'd been reading about purebred Holsteins in the farm papers for years, and from them I formed a preference for the King of Pontiac strain of Holsteins. I'd been reading about the wonderful records of his progeny, so I ordered all of that breeding I could get. Yes, I guess the farm papers got me into the purebred game, but I've never regretted it."

"Was I satisfied with the mail-order buy? Look here, last year I started to do official testing—that's the only way of telling what a cow is doing—and 17 of those 30 heifers have made 7-day records

(Continued on page 368.)

California Has Ideal Canning Strawberry

The special adaptations of the new Ettersburg races of strawberries are shown to be as striking and original as their origin is novel and distinctive.

[Written for Pacific Rural Press by Albert F. Etter of Briceland, Cal.]

Strawberries for Special Purposes.—The trade consumes large quantities of crushed strawberries used by cooks and confectioners. The consumers demand a product that is quite red, and while the manufacturer naturally prefers a deep red berry, he is able to redden up a light-colored stock by the addition of harmless coloring matter, and the trade does not object to this practice. The more essential requirements of a berry to fully meet the wants of the crushed strawberry trade are high flavor, sodility, and meatiness to give the product good body and attractive flavor. The same requirements as above noted are necessary in a berry for jam manufacturers.

The glace and maraschino manufacturers need a berry of solid structure—one that will not go to pieces in processing. They too need color in the finished product, but are able to use artificial coloring if the variety is deficient.

Strawberries, in the rank and file of ordinary varieties, never have been a pronounced success from the canner's point of view. Their deficiency is in a structure that breaks down and forms a shapless puree in processing. Added to this defect is that, regardless of the brilliant color of the fresh berry, the canned product soon fades and loses all attractiveness. Serious as this is, the flavor departs with the color. Accustomed to good canned strawberries, as it has been my good fortune to be for the last fifteen years, trying to enjoy the canned strawberries on the market causes wonder why they are put up in No. 2½ cases when a small sample would be quite sufficient where only a taste is enough. Some of these, to avoid sufficient cooking, or to counteract old age, are doctored with benzoate of soda. This is the situation of the second fruit in commercial importance in the temperate zone, as a canned fruit. Rebuild the strawberry and overcome the defects I have enumerated and the gateway is opened to a vast industry that will utilize thousands of tons of strawberries grown especially for canning purposes.

An Ideal Canning Strawberry.—We will now consider how far I have, in my work, overcome the defects in the ordinary strawberry for canning purposes. The ideal strawberry for canning is preferably globular, or nearly so, in shape; it must be red and lightly flavored; it must be firm, solid, and resist going to pieces when processed; it must hold its color and flavor indefinitely when canned; it should be of regular size and true to form. I have not one, but half a dozen varieties, that can fill every classification enumerated, and then some. Ettersburg No. 121, a hybrid between the wild Alpine strawberry of Europe and the buck strawberry from Devil's Gate, south of Cape Mendocino, fills it exactly. It is a berry that can also be picked without the husk, shipped to a cannery any distance, and after arrival stand washing like potatoes. It does not readily and quickly become overripe, nor will it break down with any amount of boiling. It is practically a wild berry and has the hardiness of the robust beach strawberry. In my region it will grow on manzanita land, too sterile to grow good wild grass. Only on medium to poor land will the berries grow to their largest size, and here, too, we get the firmest fruit, which will average between three-quarters and one inch in diameter. This fruit, if picked as soon as ripe, if processed by the minimum sterilization heat of 176 degrees for 35 minutes, will can almost solid and the fruit is as firm and whole as canned cherries.

Ettersburg No. 121, a hybrid between the wild Alpine strawberry of Europe and the buck strawberry from Devil's Gate, south of Cape Mendocino.

The serious defect of No. 121 is its susceptibility to leaf spot, which almost defoliates it in some localities and also destroys the crop. Another defect is that it will not tolerate rich moist land which aggravates leaf spot, and the richer the land, the smaller the berries.

Other Special Varieties— Euresko a new variety, is similar to No. 121, but somewhat larger, less acid, and an ideal table berry. It holds its fruit clear of the ground and is neither subject to leaf spot or averse to growing on a fairly rich land.

Ettersburg No. 89 (Dornan X Cape Mendocino beach strawberry) is a heart-shaped berry of mild acid, whose only faults are that it likes rather poor land and fades slightly. It is huskless, a great bearer, and long lived. The fruit will average an inch in diameter. I do not consider it a first-class table berry, but it is well flavored when canned.

No. 80 meets every requirement except color, which is deficient. Also as compared to the other canning berries it does not readily part from the husk, which in itself handicaps the variety by adding the additional expense of husking, which practically affects the cost of picking. Huskless varieties would save this expense and add to the profit of the grower.

No. 390 (Sample X Ettersburg No. 121) is redder in color than No. 121, but not a good table berry. It is huskless, the fruit is solid, globular in form, and produced on rather long trusses in great clusters. It will most likely tolerate rich soil as the plant has a leaning to the Sample side of the combination. On rich land I would expect some of the berries to grow double.

[At another time the matter of evergreen and everbearing characters of strawberries will be considered.—Editors.]

6% to 5.75%
IS THE YIELD

from bonds I am offering which are payable out of taxes levied on large areas of well-located California agricultural land

The Taxes required to pay interest and principal are very small compared with the value of the land upon which they are a lien, ranking ahead of first mortgages.

Agriculture is California's and the country's most important industry. It is less affected than any other during troublous times. Your ownership of bonds protected by tax-liens on large bodies of California agricultural land should produce permanent investment satisfaction and peace of mind.

The safest way "to find out."

Good Trees mean Good Crops

A cheap tree is a poor investment even as a gift. Our 26 years of experience in operating orange and lemon groves has proven this statement.

After years of care it is a satisfaction to know that your trees have not been a disappointment. People planting

Teague Quality Citrus Trees

are never disappointed. They have stood the test of a quarter century's profitable cropping wherever the orange and lemon is grown commercially.

You want this sort of tree; can afford to plant no other. Our experience is at your service; a copy of our book "Principles and Practices of Citrus Culture" is yours, if you will tell us your wants; our prices are the lowest for the best trees that can be produced.

SAN DIMAS CITRUS NURSERIES
SAN DIMAS, CAL.

HEAVY DEMAND FOR ORCHARD TREES.

[Written for Pacific Rural Press.]

Orchard tree planting is far heavier this year than last, according to Grant Stoneburner of the Armstrong Nurseries, Ontario; and there is a much larger percentage of "home builders" orders. Three times as many people are ordering $10 to $50 worth of trees this season as last. Many of this year's planters are people who wanted to start orchards last season but couldn't on account of financial difficulties. In the neighborhood of 500 such people are recorded among last year's list of prospective planters; and their orders this season are usually just about what they had contemplated last spring.

The floods have caused some people to cancel their previously booked orders for this season, especially in San Diego county; but many of these have left their orders on the books for next season, when they expect to be in shape.

Citrus Trees in Heavy Demand.—"We will sell every citrus tree we have," says Mr. Stoneburner, "at an advanced price over last season. They are in much stronger demand."

Avocados Selling Well.—Though L. E. Nigh, who has charge of the avocados, says they are better if not planted until March 15, a great many trees are being shipped out. There is very little large commercial planting, the orders being for 100 trees or less.

The Lindsay-Porterville district is taking a great many. A hundred trees were shipped to Strathmore March 1. The thin-skinned hardy Northrup is most in demand, with the thick-skinned Taft next.

Olives by the Thousands.—Orders are on the books for 77,000 olive trees to be shipped out in March and April. Most of these are Missions and Manzanillos, with some Ascolanos and Sevillanos.

Peaches Lead Deciduous.—Muirs, Lovels, Phillips, and Tuscans are the leading deciduous fruits moving, with Royal apricots, walnuts, Thompson grapes and Bartlett pears being shipped in considerable quantities.

STRAIGHT PEACH LIMBS.

[Written for Pacific Rural Press.]

Some folks haven't pruned their peach trees yet; and it is not too late, even where the blossoms are out; for whatever sap exudes will seal the pores of the cut, and healing will proceed at once instead of letting the cut dry out a month or two as in winter pruning. There is an added advantage now in that the thriftiest fruit buds are showing their vigor and may be left in preference to others.

A limb which projects straight at an angle rather than with a curve from the trunk or main limb is preferred by V. G. Lucas of Cucamonga. The one which projects nearly at right angles and then curves upward may have its fibers better knit in with the fibers of the trunk; but Mr. Lucas has observed many such, which under a load of fruit, have bent outward to such an extent that the under half of the curved portion of the limb is split loose from the upper half, opening the limb to decay.

Choice, Healthy

Citrus Trees

Washington Navel and Valencia Orange, Lemon and Grapefruit; two-year-old budded stock. Trees in perfect condition—grown in exposed positions. Best citrus stock scientific culture can produce.

We have three citrus nurseries—Escondido, Anaheim and Los Angeles. If you are near these points we can save you money by shipping direct from nurseries. Special prices on large shipments.

$2 Combination Offer

Four trees—Washington Navel and Valencia Orange, Lemon and Grapefruit, $2. Additional trees, 50 cts. each—single trees, 65 cts. each. All trees carefully balled—perfect condition for planting. Write or ask for Mr. Peck.

Need Better Root Stock for Plums.

[Written for Pacific Rural Press.]

To the Editor: The article by Edw. O. Amundsen in your issue of February 19 is very interesting and shows the urgent need of a root stock for the Diamond, Grand Duke and Hungarian plums that will make a perfect and permanent union.

As far as my experience goes, and I have inspected a great many orchards of the above varieties of plums, grafted and budded on both peach and myrobolan roots, the latter root showed as big a loss from defective unions as the former. They usually grow well for a few years, anywhere from eight to nine, and then some will start to die. Upon examination every tree that dies from this cause will show the lumpy, poor union as described by Mr. Amundsen.

I inspected a shipment of Grand Dukes yesterday, budded on almond root, and it will be very interesting to note the behavior of stock and graft in relation to making a perfect union. I believe experiments should also be made with the apricot root.

As the matter now stands it is a very serious proposition to undertake large plantings of the above named sorts, as a certain per cent will die off in the course of a few years.

I have observed from experience that a better orchard of these fruits can be obtained by grafting into the limbs of peach trees when they are three or four years old or older. This looks like an extraordinary assertion but is a fact nevertheless.

J. E. Hassler,
Horticultural Commissioner Eldorado County.

SUCKERING PRUNES AND APRICOTS.

[Written for Pacific Rural Press.]

"There is a certain time in the spring when you can go out through your prune orchard and give the suckers a little jerk so that they will pull out, leaving a clean, round hole without tearing the bark. If you let them stay a little longer, they tear the bark; and a little longer, you will have to prune them off," says A. Taylor of Santa Clara county.

Geo. Robinson also of Santa Clara county says the same thing is true of apricots. In order to catch the suckers at the right time in different localities it will be necessary to test them once in a while after May 15.

CALIFORNIA IRRIGATION DISTRICTS.

In the past fifteen years there have been formed in California, under the irrigation act which was recently amended to meet the current demands, sixty-two irrigation districts, with an area of close upon 3,000,000 acres, according to an extensive report upon irrigation in California, given out by the State engineering department. Although definite data as to cost has not been available in all instances, it is estimated that the total cost of watering this area has been close to $20,000,000. Definite figures on 2,132,489 acres under irrigation show the cost for that acreage to be $12,142,011.

Since the report was prepared and placed in the hands of the State Printer for publication the Carmichael district, near Fair Oaks, 1306.52 acres; West Side, near Tracy, 11,500 acres; Terra Bella, 12,500 acres; Lindsay-Strathmore, east of Lindsay, approximately 18,000 acres, and South Lassen district, near Doyle, with 22,000 acres, have been organized.

A number of other districts are contemplating immediate formation. They are the Paradise, Thermalito, Oroville, Willows, Princeton, Ione, Morgan Hill, Merced, Madera, Stratton and Cardiff districts.

WEAK TREE CROTCHES.

[Written for Pacific Rural Press.]

For weak fruit tree crotches, a natural binding is obtained by F. W. Duncombe of Beaumont. He selects a branch high up above the crotch, which points toward a limb on the opopsite side of the trunk, and winds it tightly with a branch from that limb, tieing the ends temporarily to prevent untwisting but not to choke sap flow. In a year's growth, these limbs graft themselves together. The same means was adopted successfully to hold two desirable limbs far enough apart.

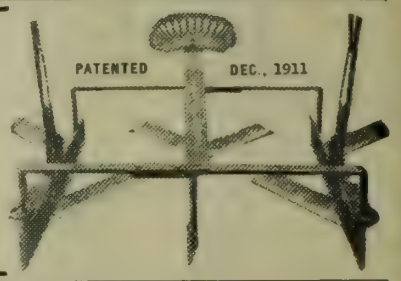
BEE PRODUCTS.

Nine products, four direct and five indirect, are obtained from bees, say the entomologists of the Oregon Agricultural College. The direct products are silk, bee poison, beeswax and royal jelly, the food of the young bees. The indirect products are nectar, honey, pollen, bee-bread, propolis and honey-comb.

About 3,000 Valencia orange trees are to be planted this spring by C. C. Chapman of Fullerton.

River Bank Protection

HAVE you property fronting on any stream? Are you losing valuable ground? Are your levees in danger from wash of river currents? Let us correct all these conditions with our Deflectors, Bank Potectors and Channel Changers by scientific methods and at a less cost than any known bank protection.



WHAT OUR DEFLECTORS WILL DO: Immediately stop bank cutting and loss of ground. Turn current away from bank. Form new channel in center of river. Protect bridge abutments and approaches. Cut out objectional sand bars. Build up your land by depositing silt along bank line. Will not interfere with navigation. Let us send an engineer to inspect and report on the cutting conditions of your land.

River Current Control Company

First National Bank Building. San Francisco.

GOLDEN GATE WEED CUTTER AND MULCHER

Farmers, order early if you want the Golden Gate Weed Cutter and Mulcher, as the demand this year will be great, as it not only cuts weeds, but kills them, and leaves finely pulverized top soil. Cuts any depth. Prevents evaporation by working under the soil without disturbing soil on top. Write for circular. C. G. SIGURD,
Capitol Avenue and McKee Road, San Jose, Cal.

Don't Delay -Send in your order for TREES now

IF YOU don't wish to be disappointed in securing varieties you expect to plant this season, we urge you to send us your order NOW.

BARTLETT PEARS

Our stock is the finest that skilled labor can produce. You cannot afford to miss this opportunity of securing these trees this season. Our price is cut in two. Write us now.

PEACHES and APRICOTS

All the best varieties in stock. Ask for our Surplus List. These trees must be moved at once. Take advantage of this opportunity to write us for quotations.

OLIVES AND CITRUS STOCK

We have a complete stock of Mission and Manzanillo Olives, Oranges, Lemons, and Pomelos, and any prospective planter should get our price before placing his order. Trees can be delivered either from our Fresno or Los Angeles nurseries. Special prices on any quantity.

SURPLUS STOCK. BEST PRICES

We have heeled in at our packing grounds a complete line of deciduous fruit and ornamental trees, small fruits, grape vines, and roses. Write us at once for our SURPLUS LIST AND SPECIAL CLEAN-UP PRICES on this stock. The trees are in perfect condition and ready for immediate shipment.

(Continued from page 345.)

save trees and crop," says Mr. Little.

Thermometers Tested. — All thermometers are occasionally tested by a standard sensitive thermometer or in crushed ice. Incorrect registry is noted on a tag so corrections may be made in the readings.

"Cold weather is likely to occur Nov. 20 to Feb. 1 or later, usually between Dec. 15 and Jan. 10. The U. S. Weather Bureau telephones forecasts of the night's temperature; and when there is any chance of cold weather, a man is employed all night to watch temperatures on the coldest districts.

"If it is down to 35 degrees at midnight, the chances are that we will have to light up by 2 a. m. When it is down to 33 degrees we call up the men in charge of the cold districts and get some of the lighters to the various district headquarters. It takes 20 to 25 minutes after the men are called for them to report.

"As a rule we light up at 31 degrees, but if long cold seems likely, we would light at 32 degrees. As the bottom of a lot is generally colder than the top, we light the lower row of he coldest lot first, then alternate pots in alternate rows, making ¼ of the pots lit. As a rule, it raises the temperature 4 degrees. If this is not enough, another ¼ of the pots are lighted and so on, showing about what proportion will be needed in general. The blocks which have heavy bloom are most especially guarded.

"The few times we lighted showed us our faults and our possibilities, and how to handle the problems best, and we do not pretend to know all, but feel the extra expense of protecting the fruit and bloom is justified, and is another form of insurance.

THE STATE HIGHWAY.

Of the $18,000,000 bond issue voted for the construction of a State highway system, $13,746,396 has been distributed over 1320 miles of State highway, according to a statement made by State Highway Engineer A. B. Fletcher. Of the total, $11,591,188 represents contract payments and materials furnished; 84:32 per cent of the expenditure going directly into the road.

The cost of administration, technically known as "overhead" expense, including the cost of purchasing, auditing and disbursing departments, the engineering assistants at headquarters, the division engineers and their assistants and the clerical forces amounted to $604,926, or 4.41 per cent.

The balance of the expense of administration not included in technical "overhead" expense, which includes field work, drafting, resident engineer inspections and the like, makes up the balance of the gross overhead, or 11.26 per cent. Included in this additional expense of administration are surveys and maps for 850 miles of highway which have not been placed under contract.

According to the figures presented by Fletcher, the Highway Commission has available $3,647,678 to finish the work under way.

The Commission has available $1,500,000 with which to do new work.

PLANT LICE SPRAYS.

Sprays in common use against lice are tobacco sprays, oil sprays and soap sprays. Any one of these, say the entomologists of the Oregon Agricultural College, is efficient against all stages of aphids, but occasionally it is necessary to add a small amount of soap to the tobacco spray to secure proper spreading qualities.

According to the University of California there are 101 boy's high school agricultural clubs in the State this year. Last year there were 65.

Fertilizer Quality

When you buy fertilizer remember you are buying what is *in* the goods and not merely a weight of two thousand pounds.

When a smelter buys gold ore he buys not merely two thousand pounds but he insists on knowing how much gold is in the ore, and you should know the amount of active nitrogen, which is the gold of the fertilizer.

Cured Fruit of the Standard Prune.

To the Editor: I am sending you a sample of Luther Burbank's Standard prune. I had a few tons of them dried this year and the whole crop averaged 32 to the pound dried. I have sent many samples to prominent growers in this State and Oregon and they all say they were the finest prunes they ever saw.

I see by the Rural Press that Mr. Swett of Martinez speaks very discouragingly about them. I think he must have them on very poor land and his trees not pruned and not well cultivated.

I sent samples to a well-known judge in San Jose, who is well posted on prunes. He answered and said that he did not want to be disloyal to Santa Clara Valley, but would say the sample of Standard prunes I sent him were the finest prunes he ever saw. How do you like them? **H. A. Bassford.**

Vacaville.

[It is not safe to base definite general conclusions on a single specimen of a product, and therefore we do not know how far the comments we make on Mr. Bassford's sample will be true, and they are therefore subject to revision. The prunes are large, of good color and finish. The next thing noticeable is that the skin is very finely wrinkled all over and does not retain considerable areas of smooth skin as a French prune does when it collapses under loss of moisture. This gives the fruit an unusual appearance from the prune point of view. The skin aspect is rather that of a wrinkled shriveled apple than that of a prune. When the fruit is eaten (after being soaked and gently cooked in the proper way) the flesh is found to consist largely of a stringy mass with a flavor, first, that of a partly dried plum and then a slight taste of fermentation. The stringy mass yield's only partly to mastication and has to be gulped down. The flesh characters and flavors thus indicated are very different from those of the French prune and much less desirable. In fact, our personal impression is that if we give the people such prunes for stewing, they will be satisfied with few of them. The pit is smaller and smoother than that of the sugar prune, but is still a coarse pit as compared with that of the French prune. But such a prune as Mr. Bassford shows will undoubtedly sell for a high price for no one knows how long.—Eds.]

THINKS HE WILL HOLD UP THE STANDARD.

To the Editor: I wrote you a few weeks ago a report of an unsatisfactory test of Standard prunes in Contra Costa county.

A few days ago I was surprised and delighted to receive from Mr. Henry Bassford of Vacaville, a small box of dried Standard prunes that are certainly attractive. They are large, running about 32 to the pound, sweet, delicate in texture, and glossy black in color. If they cook up well, it would indicate that the variety may prove of much value.

With California's wide variations in soils and climates, a variety may be very valuable in one place, and of little value in another place. I hope Mr. Bassford will write the Rural Press and tell of the conditions under which his Standard prunes are grown; soil, stock on which grafted, age of trees, time of ripening as compared with French, and also, last but not least, how these prunes were dipped and dried, for in skilful handling lies much of success or failure. But the test of a prune is not in the complexion nor in its eating qualities, raw. If I can secure a sample large enough to cook—then will come the real test. It may cook up badly; it may cook up well; but, unless, when cooked, it equals the French prune, then its value is dubious.

I shall suspend judgment on the three acres of young Standards, whose heads I was about to amputate I had planted three acres of Standard prunes, and after hearing my neighbor's experience with them, I had almost made up my mind to bud them over to some other variety. And I'm grateful to Mr. Bassford for a year's respite to my 300 Standards. **Frank T. Swett,**

County Horticultural Commissioner, Contra Costa County.

Martinez.

A report from Marysville states that the owners of the Mission Olive Acres, a 4500-acre tract of land, will be set to olives, oranges and other citrus fruits.

10,000 ACRES

of cowpeas were treated with our culture of cowpea bacteria in a state wide test in South Carolina last year. Results were stupendous. Over ninety per cent. of the farmers reported from twenty five to

100% INCREASE

over untreated crops. Most of this soil was already producing fair crops and supposed to be well supplied with bacteria—proving that the carefully selected high bred germs in

UNITED FRUIT COMPANY,
NEWCASTLE, CALIFORNIA

The Fresno Nursery Company, Inc.

Is it your intention to plant nursery stock this season? In placing your order with us, for whatever you may need, you are assured the very highest grade of stock, we having pleased our many customers the past twenty-eight years by giving them RELIABILITY, QUALITY, SERVICE.

We Have a Large Assortment of

APPLES, PEARS, CHERRIES, PLUMS, PRUNES, APRICOTS, PEACHES, ALMONDS, FIGS, WALNUTS AND CITRUS TREES.

Also a nice stock of ORNAMENTALS on which we would be more than pleased to quote your prices.

Catalog and Prices Mailed You on Request.

P. O. Box 615, Fresno, Cal.

PLUMS Orchardists are a good deal like sheep—they all move in the same direction at once. For instance, last summer Plums were cheap. This year nobody plants Plums. Just for that reason, this is a good time to plant Plums. Surplus trees, magnificent quality, prices cheaper than they are ever likely to be again. **Use your head.** Plums are steady regular, reliable. Investigate the new sorts. Prize, Beauty, Gaviota, Santa Rosa, Duarte and others, and write for special prices for Orchard planting.

FIGS The Best all-around Fig is White Pacific (identical with Kadota). Needs no Caprification, and ripens deliciously sweet, both on the coast and the interior. We can offer a splendid stock of all sizes, and some special bargains for Orchard planting.

MAMMOTH BLACK-BERRIES Extra cheap prices on extra strong plants. Write us how many you can use, and get special rates. Also lots of Himalaya on hand, as well as a good stock of St. Regis Everbearing and other Raspberries. Five kinds of Strawberries. Ask for "The Catalogue that Tells the Truth."

DELTA PRODUCERS TO ORGANIZE.

A well attended meeting of fruit and vegetable growers of the Delta section around Stockton was held under the direction of State Market Director Weinstock at San Francisco last week.

Mr. Weinstock made it plain to the growers that in his official capacity he could do very little for them as individuals, but if they would combine their products into a selling organization he could do much. By efficient organization the markets could be kept free of glutting and products be properly standardized. He stated that a movement was on foot to provide proper facilities for handling perishable products for the San Francisco markets at auction, and if the growers would organize they could take advantage of the chance to bring buyers and sellers together and the best produce would command the highest prices.

A set of resolutions were adopted pledging those who signed them to organize the strongest possible producers' association, and the Market Director is to appoint an organization committee of five.

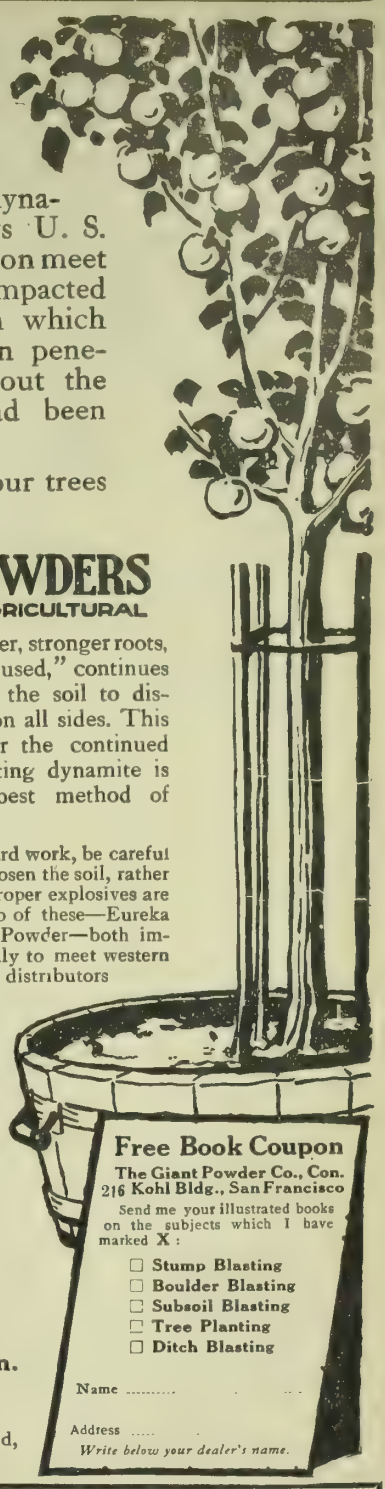
WILLOW BORERS.

To the Editor: I have a weeping willow tree that is bothered with some kind of a borer or worm, in the crown. Can you give me a remedy? —W. S., Hughson.

[We cannot prescribe definitely without knowing more of the nature of the insect with which you have to deal. It may be too small to follow up and kill or it may be large enough so that you can cut it out with a knife or kill by punching a wire into his burrow. If we are obliged to prescribe without more knowledge we would advise to cover the crown or base of the tree, all over the rough bark, with asphaltum Grade D in the expectation of holding in the present inmates so they could not emerge to lay more eggs and to exclude all other hatchings from eggs which wandering outsiders may deposit. This band of asphaltum should begin say six inches above the ground surface and extend six inches below—as is done in the cases of root borers which affect fruit trees growing on peach roots.—Eds.]

TO KILL WILLOW SPROUTS.

To the Editor: Is there any way to kill willows except by everlasting grubbing? Where the roots are cut they sprout up so badly.—E. C. H., Turlock.



[Willow sprouts can be killed by pouring a little gasoline close to the base where it will follow down to the root, but it is an expensive method. Grubbing out deeply is the common way.—Eds.]

SUDAN ON ADOBE.

To the Editor: Will adobe land be suitable for Sudan grass, and what is the best time to sow? Answer through our (not your) paper. —A Subscriber, Morgan Hill.

[Sudan grass will grow on any kind of land which will grow anything, so long as there is no frost. Plow and harrow while the land is in good condition and sow when you consider it safe to plant corn.—Eds.]

Would you plant your fruit trees in large tubs?

"Without the use of dynamite in tree-planting," says U. S. Bulletin No. 38, "the roots soon meet with the smooth and compacted sides of the hole, through which they have great difficulty in penetrating. The tree is in about the same situation as if it had been planted in a large tub."

But when you plant your trees in holes blasted with

GIANT FARM POWDERS
STUMPING — AGRICULTURAL

the trees will grow faster, develop deeper, stronger roots, and bear earlier. "When dynamite is used," continues the bulletin, "cracks are formed in the soil to distances of five or sometimes six feet on all sides. This makes the very best conditions for the continued growth of the tree. For tree planting dynamite is recommended confidently as the best method of preparing the soil."

In selecting explosives for your orchard work, be careful to get those that will crack, powder and loosen the soil, rather than pack it or throw it in the air. The proper explosives are the Giant Farm Powders. There are two of these—Eureka Stumping Powder and Giant Stumping Powder—both improved forms of dynamite, made especially to meet western agricultural conditions. They are sold by distributors everywhere. Ask your dealer for them.

Los Angeles	0	18.99	12.49	96	52
San Diego	0	11.97	8.01	80	54

THE WEEK

"WHAT TO DO FOR RURAL CREDIT?"

WE GAVE a lukewarm answer to the question, "What to Do for Rural Credit?" in our last issue, because the measure we then had in mind was so short a step in the right direction that it seemed doubtfully worth while to take it at all. Since our last issue we have received an outline of a measure which goes farther and should be supported by those who are seeking rural credit in the public interest. It appears that the earlier measure, which came from a joint House-and-Senate committee last January and was patted on the back as safe and sane by stand-pat economists, pleased nobody else but them, and was scouted by farmers' organizations at the East as not acceptable as a redemption of the administration's promises in the rural credit line. And so modifications and extensions were framed by the Senate committee in the hope of filling this deeply felt, political want. This is the measure, of which an outline is given on another page of this issue. No one can say what chances it has, but it may be easily imagined that it has no chances at all unless it is strongly supported by those who favor rural credit provisions which really provide something, and it must clearly appear that it has a demand among the farmers, to whom it will give a way to use their credit for the support of their industry.

IT WILL HELP EVERYBODY.

OF COURSE this bill will be opposed as class legislation, but is only class legislation in the sense that it gives the debtor class a chance to meet its obligations and its needs, fairly to itself. The March issue of the Journal of the American Bankers' Association has this comment upon the bill we are approving:

It converts the government into a farm loan agency with the obvious result—if not the purpose—of competing with all existing plans of making farm loans and of destroying individual initiative and opportunity. It creates a favored class, and the correction of the idea of favoritism will not be found in the repeal or modification of this provision, but in the gradual inclusion of other classes in other favors of similar import.

Judging by the context from which this quotation is taken, the point made is intended to be adversely critical, but it appeals to us as one of the strongest arguments for rural credit that can be made. It seems to be an apprehension that if the farmers get this chance to assemble their security for credit at fair rates, other borrowers will in some way do the same. Well, why not? This apprehension justifies our suggestion that the only class legislation involved is justice to the debtor class as against the creditor class, which has thus far enjoyed advantage beyond sound public and private interest. It becomes then class legislation in the sense of evening-up benefits and advantages between all classes, and particularly between the great debtor and creditor classes—both of which include men of all interests and occupations. And there is another aspect, perhaps a more superficial one, in which usable credit at fair rates helps everybody. It increases production; multiplies the demand for manufactures and supplies used in production, and gives new purchasing power to secure them; it opens wide new fields for trade, transportation and national influence; it solves problems of unemployment, and lifts everybody to a higher level of comfort and satisfaction in living—and, what should win the support of the capitalistic and money-handling vocations to it, it will keep more money constantly and profitably busy. As it now is, one-half (or some other fraction which we do not know) is practically locked up so that the balance can struggle for a high rate of interest. As it ought to be, all the money should be busy, yielding less for the dollar, but more for the mass, to the owners of it. This is no dream; it is a demonstration. Before the war, practically all continental European countries had rural credit provisions like that now proposed for this country, and have still the results they achieved as an important element of their fighting strength. The old-line banks fought them at first and prophesied disaster. A few years later they ceased to fight rural credit associations, and began to use them. They found them secure and a good line of activity for their idle money. With little increase of over-head and without interference with their old methods and policies, these banks quietly slipped millions into rural credit channels and increased their net earnings notably. It will work just the same in this country as soon as the conservatives recover from the shock of the pending operation. The American Bankers' Journal is perfectly right; there will be a "gradual inclusion of other classes in other favors of similar import," and the banks will make lots more money out of money, although our contemporary shivers at an apparition the beneficent purposes and practices of which he does not understand.

BRITISH EXCLUSION OF OUR FRUITS.

THE British order against the admission of our fruits, which was rather dimly descried in our last issue, has now become more clear. It is "an order in council" manifested by royal proclamation forbidding, after March 3 or March 13 (there is still doubt about the date), the importation of "canned, bottled, dried and preserved fruits, except currants," but such products from dominions and the colonies are exempted from the order, as likewise are "any fruits imported under license given by the board of trade." Cargoes enroute before the right March date will be admitted. As to the reason for this exclusion of our fruits it is said that the order comes because of the "blacklist" under the oft-repeated British claim of "trading with the enemy." If this is true, a little return to "twisting the lion's tail," which was so popular a pastime half a century ago, would not be amiss. We could easily make him roar that way—but let that go for the present.

With the official action noted above there comes to local dealers from their London brokers this statement: "The British government will, on October 31, state what of the 1916 American crop they will take, and indicate that it will not exceed 50 per cent of the normal demand." If that is from the government, it is a pure bluff; they will take what the people of England demand and can pay for. The British government is not strong enough to go against the popular cry for good food, and there is no reason why even a stronger government should do it. It is not an English policy. In fact, it is something which the British nation claims to be fighting against.

WHAT SHOULD BE DONE ABOUT EXCLUSION.

THE thing manifestly best for our affected fruit industries to do is to keep a cool head. The shock comes at the best possible time of the year to fight demoralization by investigation, calculation and co-operation. In the first place the continuation of the war, upon which the exclusion seems to be based, is not at all sure. Personally, we believe it will be over before our fruit ripens, because of the sheer heart-sickness of the belligerent people and the poverty of their governments. Then it will be a rush for whatever indulgence in food money can be found for; and the flavor, wholesomeness and cheapness of our dried fruits will commend them. If England does not wish so much of them Germany will desire more and Germany has been upon a prescribed and restricted diet so long that her people will be ravenous for something good. But suppose the war does go on, it does not follow that British fruit exclusion will; it may drop any time at a touch of diplomacy. If we should threaten them a little less of munitions they would be willing to take a good deal more food. So it is important for the grower to realize that the whole thing is a pawn in the war-game and not to be demoralized by it.

At the same time it is important for the producers to do everything that it would seem wise to do if there were no escape from exclusion, either by removal of it or by diversion of supplies to other foreign consumers. Let them get together and dig up wisdom. Let them accumulate force for defense and for aggression by co-operative organization. Is it not humiliating that the call upon the Washington government for a protest against adverse British discrimination is so far apparently going only from fruit dealers? What are the growers voting and paying taxes for? Don't go back in the corral and moan; get out on the highway and yell!

Then, too, get busier on co-operative selling. Tell Col. Weinstock to placard every large American town with your fruit sales. Americans could and would eat all your stuff, anyway, if they knew how good and cheap it really is. Don't get rattled; do something! If you cannot think of anything else, go out and fight the British by plugging firewood against the barn door. It will make you feel better and ready for something more reasonable.

THE BLUFF ON BARLEY AND HOPS.

TO GET fuller conviction that this dried fruit exclusion is only an incident in the war game, as just claimed, see what has happened to the barley-and-hop exclusion which was recently threatened. E. Clemens Horst, our leading Californian in these lines, reports receiving London advices, carrying assurance that the United Kingdom was unlikely to place an embargo on imported barley and hops. It seems, as we stated some weeks ago, that exclusion of brewery supplies was proposed first and afterwards shifted to fruits—which probably means that the government concludes that the people can get more comfort from beer than from prunes. This conjecture seems to be supported by Mr. Horst, who recently said: "The person who sent the cable is in touch with a member of the British Parliament, and is, therefore, enabled to feel the pulse of that body regarding a barley and hops embargo." This being the case, we hand over the whole British governmental outfit, from George to Tommy, to our prohibition readers—remarking that we do not care what they do to them.

POULTRY IN "THE HOUSEHOLD."

OUR poultry department, which the reader always finds farther along in each issue, is so well endowed by President Croley and Madame Swaysgood that the editor seldom has more to do than cast admiring glances upon it. Once in a while, however, there arises a great issue in the poultry department of our general social life that requires a leading comment. Just now it occurs to us that it may indeed be in the poultry yard that the great issues of feminism and masculinism, which are now vexing the whole world, must actually be fought out, for all the conflicting rights of the sexes are represented in it. This statement does not admit of argument, but invites concrete illustration. Last week in Oakland there was filed a divorce complaint by Helen M. Hawthorne against Francis A. Hawthorne, a Mendocino county rancher. She claims that Hawthorne forced her to keep his turkeys in the warm kitchen. She declares that three hundred turkeys in one kitchen, and live ones at that, are too many, and she says to him, "No"—in great scarlet letters. About the same date in San Mateo county Hans J. Toft brought a suit for divorce on the ground that his wife was a great chicken fancier, taking such a fancy to chickens that she has been giving them more liberties about the house and paying more attention to them than to her husband. He admits that chickens may be all right in their place, but have no proper title to roost on the back of dining-room chairs. Toft admits also that incubators may well be considered indispensable—but resolutely refuses to move his bed to make room for any more of them. And over both these cases there has arisen a great crowing and cackling in the courts.

Queries and Replies.

Querists must give name and address.

Treatment of Apple Grafts.

To the Editor: I have two-year-old apple grafts which were cut back last winter and again summer-pruned last summer. They have made a growth of 4 to 6 feet since the summer pruning. Should they be cut back now or merely thinned out and shaped and allowed to continue their growth?—P. P. W., Little Rock.

We presume these are top-grafts on an old tree. If so, we should both thin, shape and cut back once more for fear such strong growth might catch too much wind-stress and blow out. Smooth the stump at the base of the graft so that good growing over may be facilitated and keep exposed wood of stump painted lightly, so the graft may have a sound stump to grow over. If, however, you refer to low grafts on young roots which are to make tree trunks, removing surplus shoots for shape may be all the pruning needed this winter.

Peach Blight in Lake County.

To the Editor: I am sending you peach twigs infected with some disease and would like to know what it is. The twigs are from old trees. I have some young trees affected the same way, only not so badly. While the trees showed the disease it has developed rapidly since they were pruned in December.—E. T. S., Upper Lake.

It is a very characteristic case of "peach blight." The killing of the bark of the new wood in spots and patches and glistening exudation are the result of the progress of the fungus since the leaves fell. It is to prevent this serious injury that spraying with Bordeaux or lime-sulphur should be done not later than December 15, or immediately after pruning if pruning is finished earlier than that.

About Tomatoes.

To the Editor: In setting out tomato plants, is it best to put manure in the hill or spread it on top of the entire piece and harrow it in? The soil is the red heavy hard-pan kind that bakes very easily. Also advise me as to the best way of pruning the plants to get the best fruit.—C. A. S., Fresno.

We would use no manure in the hill but apply it broadly over the land and work it in during the winter preceding the tomato planting. Tomatoes, however, are not most fruitful in soil which is too moist or rich, and direct manuring of them is not desirable unless the soil is very poor. If the number of plants you are growing is not too great we should mulch around them with broken straw or other litter to keep the soil from surface baking, and only enough to keep the plants growing slowly. In a deep light soil with a fair amount of subsoil moisture they will bear better without irrigation—but of course they must not be allowed to get too dry. Pruning is seldom done. With strong-growing plants, allowing four or five branches, removing low side shoots and cutting away the top a few inches above the highest blossom cluster, often promotes the setting and development of the fruit.

Corn and Cow Peas.

To the Editor: I have been reading in an eastern paper about corn and cow-peas being raised in the same field. The corn is planted in rows seven feet apart and the rows of peas half way between. It is stated that more corn has been raised per acre than in adjoining fields where corn is planted three and one-half feet apart and no peas. Of course the peas are leguminous and supply nitrogen to the soil, but it does not seem as if this should help the growing corn. Is there a market for cow peas?—K. O. P., Orland.

It is true that a growing legume supplies nitrogen and improves the growth of another adjacent plant while both are growing. We do not know the exact measure of that help but we must doubt that it would make one row of corn do the work of two rows—cultivation and moisture being the same in both cases. Try it and you can tell us something about it. The cow pea which is largely grown in this State under the name "black-eye bean" sells well. Other cow peas are not largely grown, but are in demand as seed for green manure crops to a certain extent.

Clean Ground for Nursery Stock.

To the Editor: I am thinking of setting out some myrobolan seedlings on a piece of ground from which old neglected prune trees were removed this winter by a tree puller. An occasional tree displayed root knot. Would this ground be a possible source of infection to young nursery stock? As the old roots were all pulled from the soil, would the disease still remain? Would excellent care of nursery stock help resist infection if such infection is possible under condition mentioned?—Planter, S. F.

Although we might not hesitate to replant orchard on the ground you describe, changing the rows so as to plant in the old middles, we would not think of planting nursery on such ground, if we could find new land which has had neither orchard nor nursery stock for a few years. Avoiding the chance of root knot is only one of several reasons for getting new land. Of course you are not sure to be free of root knot on new land, but the chances are certainly worth seeking. No amount of care nor any kind of treatment has been demonstrated to be successful in preventing the trouble.

Watermelons and Piemelons.

To the Editor: Will a volunteer melon patch eventually produce the citron, a so-called pest? Is it best to secure melon seeds each season from a dealer, or to use the same seeds each season and thereby avoid the chance of producing citrons?—R. L. W., Fresno.

We never saw just the transformation from watermelon to piemelon (citron), which you describe, but we should rather expect to see it, for both melons are of the same species, and the piemelon is the more permanent form, and others would be apt to revert to it. To get the best watermelons you should buy seed each year from a seed grower who has a reputation to preserve, and therefore keeps his plants beyond cross-pollination, and takes seed from none but the best specimens of the true type of the variety he is growing; or you must grow and select your own seed in the same way that a good professional seed-grower does. If you take seed from misshapen specimens which will not sell or from those left over at the end of the season, your melons will get poorer and poorer. The same will be true if you buy seed without assurance that they have been properly selected. If there are piemelons growing within flight of bees you are likely to keep getting nearer to a piemelon. Whether you will get there without crossing with the piemelon we do not know.

Mechanical Power on the Farm.

CARE OF THE AUTO ENGINE.

[By L. B. Weyman.]

To secure satisfactory work from an automobile engine, attention must be given to at least four particular points. The carburetor must be properly adjusted, the combustion chamber free of carbon, the spark plugs must be in good condition and oil should be reasonably fresh and clean. Now, all of these points can be attended to by the owner or user, provided he has the disposition to do so—technical skill is not at all necessary, especially with a machine constructed as simply as the 1916 Overland.

The first and most important point, of course, is the adjustment of the carburetor, which should be so adjusted that the mixture will not be too rich or two lean. The proper mixture is one that is just as lean as possible, as a thin mixture is faster and more powerful than a rich mixture. All that is necessary is to thin out the mixture by increasing the air or cutting down on the gasoline supply until you arrive at a condition where with a cold engine there would be a sneezing or coughing in the carburetor, which symptom will pass away as soon as the engine is warm. This is a very easy adjustment for any one to make.

The next important point is to keep the carbon out of the combustion chamber, and this is also very easily attended to by any one by scraping the carbon loose with carbon scrapers, which can be secured from any supply store, and blowing the loose carbon out of the valve domes, or the valve caps, with a foot pump, bellows or compressed air. The only point to be careful about is to see that the bottom valves are shut, so that none of the loose carbon will get under one of the valve seats.

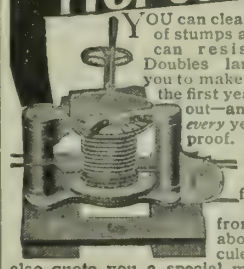
To insure the piston being in firing position, proceed as follows: Remove the valve caps or domes from No. 1 cylinder, open the pet cocks in the other cylinders, crank the engine over by hand and watch the inlet valve until it rises and then seats.

The next time the piston comes to the top it will be in firing position and both valves are shut with the piston anywhere near the top. With the piston at the top, or within one-fourth of an inch of the top of the stroke, go in with your set of three carbon scrapers and scrape the carbon loose and blow it out as above directed. Screw in the valve domes and pass on to the next cylinder, working on one cylinder at a time.

To see that spark plugs are right, there must be no cracked porcelain.

The spark plug must be reasonably clean, and the important point is that the spark plug points must be 1-32d of an inch apart. Spark plugs should be occasionally inspected as to the spark gap, because this distance is sometimes increased by the slow burning away of the spark plug wires from the action of the electric spark.

The oil in the engine crank case should be drained off every 1000 miles and the crank case washed out with kerosene and fresh oil supplied. After draining off the old oil, close the drain plug and put one gallon of kerosene in the crank case, start the engine and run it for a minute, and then drain off the kerosene and fill the engine with fresh oil. As stated, this should be done every 1000 miles, because after the oil has been splashed around in the engine for that distance there is very little oil to it and it is more like dirty water than oil.



DRY CELL TESTER NEEDED.

[Written for Pacific Rural Press.]

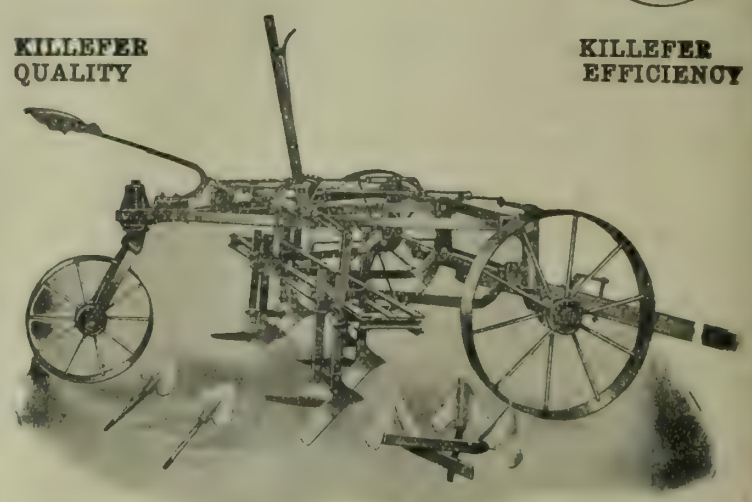
How an automobile helped a tractor is told in regard to W. S. Herring of Puente who had worked half a day to get his Samson tractor started. At last he found that the trouble was in the batteries. His wife took a flying trip several miles to town in their auto, returned with new batteries, and the tractor was soon busy plowing up an orchard.

This suggests the need of a little

Pull 100 Stumps A Day—With The Hercules

YOU can clear an acre or more of stumps a day. No stumps can resist the Hercules. Doubles land value—enables you to make $1200.00 on 40 acres the first year after stumps are out—and $750.00 in crops *every* year after. Get the proof. Why not

Write Us Now

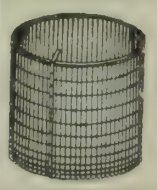


Book tells all the facts—shows many photos and letters from owners—tells all about the many Hercules features. We'll also quote you a special money-saving price proposition that *will interest you.* Address

HERCULES MFG. CO. 112 24th St. **Centerville, Iowa**

Beet Cultivator (K)

KILLEFER QUALITY **KILLEFER EFFICIENCY**



The frame of this Cultivator is made of one continuous piece of high carbon steel with a truss connecting it to the main castings, supporting the two steering wheels. This construction makes a cultivator that is almost impossible to break down in the center and in consequence the wheels are always in line and under easy control.

The lower frame or tooth bar is from the same quality of steel with a strong arm at each end, which connects with the lifting rod, allowing no chance for the frame to dip or run deeper at the ends. The seat is set back far enough to give an unobstructed view of the rows. The foot control of the front wheels is adjustable with a turn-buckle for taking up wear, and is very easy on the operator. A lock is provided for the rear wheel that holds it rigidly in line except on the turns. This is the **strongest** and **best made** Beet Cultivator for sale on the Pacific Coast.

P. & O. No. 40 Combined Corn and Bean Planter

Furnished with open center or solid concave tires.

The Combined Corn and Bean Planter here illustrated is a machine built by one of the largest manufacturers of planters in the world, particularly to meet the requirements of the Pacific Coast trade.

It is not a made-over machine but is built from the ground up for Coast needs. This fact, together with the reputation of the P. & O. Company for building tools right in every detail, insures absolute satisfaction to every user of this planter.

It's the Way They are Built

FEATURES:

Equipped with a full set of plates for planting any of the different kinds of corn or beans commonly planted in California, including Egyptian and Kaffir corn.

Adjustable to any width rows from 28 to 44 inch. The check rower machine is adjustable for checking rows 3 ft. 4 in., 3 ft. 6 in., and 3 ft. 8 in.

Accurate planting insured by the sight feed. Sight feed has a large opening, and the seed is visible at all times to the operator as it drops from the hopper to the upper valve.

Quick, detachable runners held on the shank by one bolt. Easily removed for sharpening.

Write for descriptive circular and address of nearest agent.

CHUBBUCK'S IDEAL GOPHER TRAP
Larger than runway; jaws pull rodent in; catches large or small gopher and holds it. Farmers say it's worth dozen other makes. Big sales. **Price 50c.** If not at your dealer's will send it to you postpaid; 2 for 95c; 6 for $2.70; 12 for $5.10. Money back if you are not satisfied. Free circulars.
E. J. Chubbuck Co., Dept. B San Francisco, Cal.

instrument to test the current generated by a dry cell. When touched to both poles of the cell it indicates the number of amperes of electricity. A good cell should generate 30 amperes.

A dead cell in the battery reduces the efficiency of all the rest. This was shown recently when R. L. Rice of Los Angeles had trouble with his automobile. It missed so many explosions that he was afraid to start on a pleasure trip. Test with the instrument caused one dead cell to be thrown out, and though no new one was added, the trip was made with practically no misfiring.

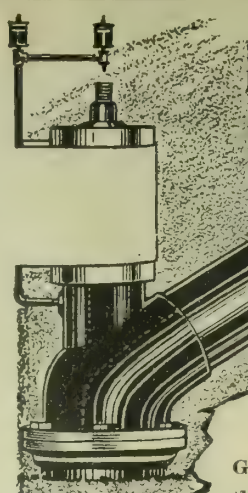
CARBURETION.

The office of the carburetor is to mix air with liquid fuel as it comes from the fuel tank. This vapor then enters the cylinders, where, being highly combustible, it burns with great rapidity when ignited by the electric spark and gives force to the pistons and so on.

Progress of Carburetion.—The fuel as it comes from the fuel tank is a liquid. This liquid fuel enters the carburetor through the admission valve. When the proper quantity has entered the bowl, the float is raised and shuts off the flow. When the level of the fuel goes down (due to the vaporized fuel entering the cylinder), the float lowers and admits more fuel. This float-feed type of carburetor is most generally used on gas motors.

The suction in the cylinders, caused by the piston moving away from the cylinder-head, draws a volume of air through the air-passage and across the spray-nozzle. From the spray-nozzle a thin jet of fuel is spurting and this draught breaks it up into a finer spray and vaporizes it. The finer the spray, the more rapid and complete will be the evaporation. This in turn means that the combustion will be more perfect and greater power obtained from the fuel. This fuel vapor is now drawn into the cylinder for compression and burning.

On some types of carburetors there is a special adjustment for the air-intake which requires more or less attention.



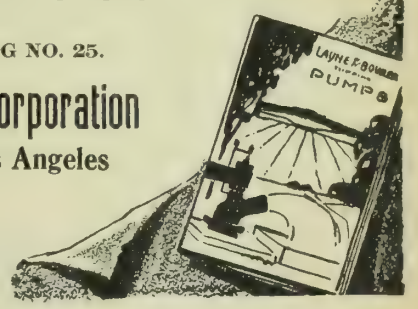
A vaporized gasoline or distillate charge is 1500 times greater in volume than the liquid fuel. When mixed with air it is 15,000 to 18,000 times greater. The importance of an ample supply of air is thus shown.

The vapor entering the cylinder can be regulated in two ways:

1—At the carburetor by adjusting the spray-needle by means of the spray-needle-valve thumb-screw. When the proper adjustment has once been obtained here, this spray-needle-valve should be left strictly alone.

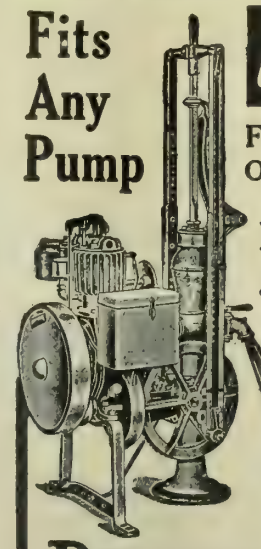
2—By the throttle, which is operated from the driver's seat. This throttle opens or closes the butterfly-valve in the strangling-tube and so controls the volume of air to be sucked through the carburetor. When the valve is open and more air is coming through, a larger quantity of fuel is vaporized and enters the cylinder for combustion. This lowers the fuel liquid in the bowl, the float goes down, more fuel is admitted for vaporization, and so on.

The chief control of the speed of the motor is this opening and closing of the throttle.



LAYNE & BOWLER PUMPS

Great improvement has taken place during the last decade in pumping machinery. The efficiency of the pumps has been noticeably increased and the designs simplified. Probably the most wonderful achievement has been the substitution of CENTRIFUGAL MOTION in place of complicated valves and plungers, and reducing friction to a minimum. The greatest economy will now be obtained by installing a pump of the centrifugal type. No other style of pump of equal capacity can be purchased and operated for so little money.



Layne & Bowler Turbine Centrifugal Pumps have for many years been invariably recognized by every pumping authority as the type of pump affording the greatest simplicity combined with the least investment for a given pumping capacity.

WRITE FOR CATALOG NO. 25.

Layne & Bowler Corporation
900 Santa Fe Ave., Los Angeles

Fits Any Pump

All You Want Of It

FROM 270 TO 2450 GALLONS OF WATER PER HOUR WITH THE

FULLER & JOHNSON FARM PUMP ENGINE

This Farm Pump Engine has been rightly called *"the mainspring of the farm."* Can be attached directly to any pump without extra fittings, special platform or foundations. It works in any kind of weather and will supply all the water needed for home or stock in the hottest and calmest days—for household or garden use—for washing buggies—fighting fire—for cooling porches—sprinkling lawns, etc.

No extras to buy. Comes complete in one crate, ready for instant use.

Remember there are 73 years of honest manufacturing experience behind this **Farm Pump Engine.**

It is not to be compared with cheap articles of the same sort which are *built merely to sell.* This engine is *guaranteed* and once you use it you'll say it's the best investment you ever made.

Our Low Price will surprise you.

Power

The **Farm Pump Engine** is also a complete power plant in itself. Relieves you of turning cream separator, churn, washing machine—in fact, anything that can be hitched to it. Runs steadily and easily and without vibration.

FREE BOOKLET

Let us explain in detail just what this pump can do and why it will pay you to own one. Send for our free booklet.

General Agricultural Review.

DECIDUOUS FRUITS.

Satsuma and Burbank plums were in full bloom in Los Angeles county last week and promised a heavy setting.

C. Brawley of Fresno has purchased 40 acres of land near Merced which will be planted to Adriatic figs this spring.

Smudging to protect their apricot trees was practiced by some growers in the Santa Clara valley last week. No damage was reported.

The California Prune and Apricot Growers' Information Bureau has appointed L. R. Boedefeld local representative for Colusa county.

A report from Victor Valley states that 45 acres of apple trees have been planted and 35 acres of pears are to be planted on the ranch of Dr. Hitchcock.

Driver and Driver, who recently purchased 160 acres of land near Dinuba, are planting it to figs, 80 acres being planted to Calimyrna and 80 to Adriatic.

Berry growing in the Gardena and Strawberry Park section of Los Angeles county has practically passed into the hands of the Japanese, who raise them cheaper than white men can.

According to statistics compiled by the Santa Rosa Clearing House Ass'n, prune growers in that vicinity realized $310,000 profit from their prune crops last year. Neither grapes nor hops fared so well.

E. W. Beers, Horticultural Commissioner of Santa Barbara county, reports the seizure of one shipment of trees infested with Peach Yellow and Little Peach during the month of February.

According to Niles Searles, County Farm Adviser of Yolo county, the prospects for large fruit and nut crops in Yolo county are exceptionally bright, the trees being heavy with blossom with prospects for a light fall.

E. M. Parker of Tulare has what he believes to be a perfect strawberry which he has been developing for the past six years. Some of the plants are six years old and still bearing, frost seeming to have little effect on them.

At a meeting held in Orosi last week $1520 was signed up for the California Peach Association. Bankers and business men are supporting the new association throughout the San Joaquin valley with generous subscriptions.

That seedling walnuts are no longer demanded is the statement of C. A. Stoddard of the Magnolia Nurseries, Whittier, who says that of their 1,000 Chase seedlings, only 300 were dug and 295 of them are still on hand. People specify budded Chase walnuts.

Chas. F. Collins, County Horticultural Commissioner for Tulare county, reports a heavy planting of prunes in Tulare county this year, particularly in the Farmersville district. He states that some farmers are even tearing out peach trees to make way for prune planting on a larger scale.

An effort is to be made by the directors of the California Peach Association to sign up the remaining portion of the peach growers and get the money into the treasury by April first. With that end in view they will hire expert salesmen who will be sent into all peach growing districts of the State.

H. W. Adams, traffic manager of the California Fruit Distributors, has secured an agreement from the railroads to permit storage of pears in transit for an extra charge of five cents per box. This will do away with the glutting of markets as under the new plan pears can be stored in Omaha or Kansas City or other middle western points and distributed according to the demand.

An open meeting of the Prune and Apricot Growers' Information Bureau was held at San Jose March 10, to discuss the possibilities of auctioning prunes in the Eastern markets. The meeting was addressed by E. L. Goodsell, who handles the bulk of California fruits sold at auction in the East, and by State Market Director Weinstock. Mr. Goodsell and Colonel Weinstock also addressed a similar meeting of peach and raisin growers in Fresno, March 11.

That fire blight in orchards of Yakima county has resulted in the cutting out of trees on 2,000 acres, causing a loss of $100,000 in the assessable valuation of Yakima county lands, and has reduced the loan value of Yakima orchards by $2,500,000, are statements contained in the annual report of District Horticultural Inspector. He states that agents of loan companies have informed him that the loan value of orchards, formerly $200 per acre,

Grand Prize—San Francisco and San Diego Expositions

has been reduced 25 per cent as the result of the blight. The inspector informs his superiors and the county commissioners, to whom a copy of the report was furnished, that with proper co-operation by owners of orchard lands, inspectors and officials, blight can be entirely eradicated during the coming season.

CITRUS FRUITS.

The San Dimas Nursery shipped 10,000 Marsh Seedless grapefruit to Rio Grande Valley, Texas, last week.

Two new orange packing houses are to be built at Lindsay before the next navel season starts, according to advices from that city.

A packing house is to be erected by the Strathmore Early Orange Ass'n in a short time, a building site having already been purchased.

McMillan and Graffin of Spadre made a shipment of 6,000 navel oranges and 6,000 Eureka lemons last week to Rio Grande Valley, Texas.

The Anaheim Citrus Fruit Ass'n will build a $40,000 ice and fruit pre-cooling plant this season. Their year's output is estimated at 700 cars.

Some 500 acres of Valencias and lemons are being planted this spring by the Banstanchury Ranch Co. of Fullerton in addition to over 1,000 acres planted in recent years.

The Lemona Heights Nursery Company of Riverside shipped two carloads of citrus nursery stock to Imperial Valley last week and will ship another two carloads to the same place in the near future.

RAISINS, NUTS AND OLIVES.

Reports from Santa Barbara county are to the effect that a San Diego firm is endeavoring to purchase oil olives in that county, but are meeting with little success.

Walnut growers near Hemet have formed what is said to be the first walnut growers' association in Riverside county. The association will be affiliated with the California Walnut Growers' Ass'n.

FIELD CROPS.

The rice acreage in Butte county this year will amount to between 20,000 and 25,000 acres.

The honey crop of Kings county amounted to about 180 tons last year and was sold at an average of 3½ cents a pound.

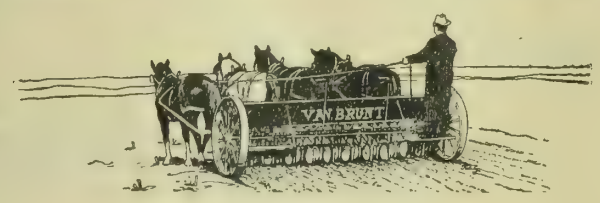
According to data prepared by the California Olive Growers' Association there were between 7,000 and 8,000 tons of pickling olives produced in California last year and with a normal increase the crop this year will be about 12,000 tons.

F. W. Waite, Horticultural Commissioner of Imperial county, is advising farmers to keep down the grasshopper pest by spraying all ditch banks with crude oil or creosote.

E. L. Davenport of Chino reports the alfalfa outlook for the year to be very good. Cutting in all sections of southern California is now under way and prices in field are starting at $14 a ton.

Early prices of asparagus have been entirely satisfactory from a grower's standpoint this year, the California product being sold in the East at a much higher price than that produced in the southern states.

What is said to be one of the largest movements of barley across the continent by rail ever sent from California is a shipment of 70,000 tons which is already stored in warehouses at Port Costa, Stockton and San Francisco.



A 3600 sack lot of onions were dumped in the San Francisco bay last week, having been condemned by State horticultural inspectors. They were being held by speculators who failed to realize anticipated prices.

Mrs. J. W. Terrill of Florin states that moth balls, powdered and dusted on the corn silk, just as it appears, will keep the ear free from worms. A pepper shaker makes a handy utensil to do this with. A couple of shakes to the ear is all that is necessary.

Corn growing is to become popular in Kings county this year as a result of the contest which has been started by the Kings County Chamber of Commerce. Kings county farmers have been raising good corn for many years, but not on such an extensive scale as it is thought possible.

The University Farm Picnic this year will be held at Davis, April 22. It is expected that the auomobile travel to the picnic will be materially increased this year as a result of the completion of the causeway across the Yolo basin, which connects Sacramento and Yolo counties.

Van Brunt Drills
With Adjustable Gate Force Feed

THEY plant any small seed, alfalfa to bearded oats, peas or beans.

Amount sown per acre easily regulated merely by shifting feed gauge levers.

All the ground sown, because the Van Brunt adjustable gate force feed and special agitator in the hopper compel seed to leave hopper in even, continuous streams—no bunching or choking up—and an equal amount goes into each furrow.

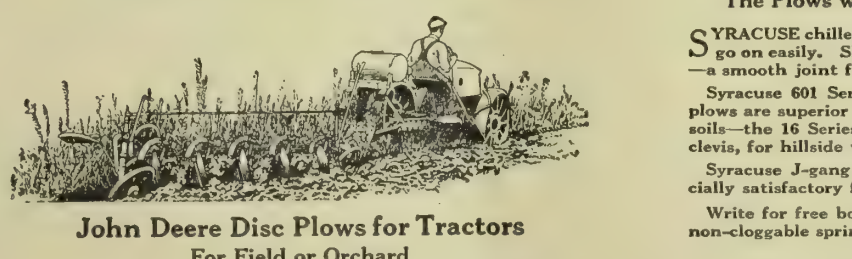
An even stand of grain is secured, because pressure springs compel all the discs to cut furrows of even depth, and the closed delivery places seed at bottom of these furrows.

Van Brunt Drills do not clog up. Scrapers keep discs absolutely clean.

Smooth running—each wheel drives half the feeds, equally distributing the work. A direct, double, gear drive from the continuous axle.

High grade discs with bearings that are guaranteed to last lifetime of drill. Either single or double discs.

Grass seeder attachment can be furnished which will drill or sow broadcast as desired. Write us for free booklets.



John Deere Plows for Light Tractors
For Orchards and Vineyards

PRACTICAL—one-man outfits. Work with any standard tractor. Controlled by man on the tractor.

High and Level Lift—Pull the rope and all bottoms raise high and level. Another pull lets them down. Plows do not clog or gather trash on the turn.

No levers—plows leveled and depth regulated by screw device. Can be run close to trees and vines without injuring branches.

Regular with three or four 12-inch bottoms. Quick Detachable Shares—save 80% time changing shares. Write for free booklet describing light tractor plows for orchard and vineyard, or regular field work.

John Deere Disc Plows for Tractors
For Field or Orchard

MADE especially for use in the West. Work successfully in every soil where a disc plow should be used.

Plow anywhere from five to twelve inches deep.

One-man outfits—controlled by man on the tractor. Work with any standard tractor.

Can be used either for field or orchard work simply by changing the land axle.

All levers down close to plow when at work—plow can be operated close to trees and under limbs without injuring them.

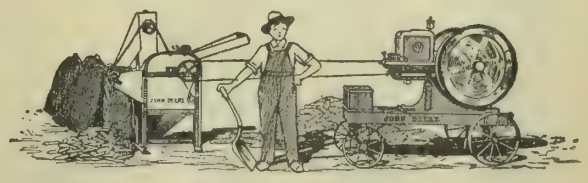
Easily transported—special lever at the rear for lifting discs high and level.

Over fifteen inches clearance under beam; twenty inches between discs.

Twenty-four or twenty-six-inch discs with chilled metal bearings—constructed so that bearings do not drag along wall of furrow when plowing deep.

Can be reduced to four discs by taking off one intermediate section and telescoping connecting rods.

Write for free booklets describing the John Deere Tractor Disc Plow No. 10 for field work and No. 11 for orchard and vineyard.



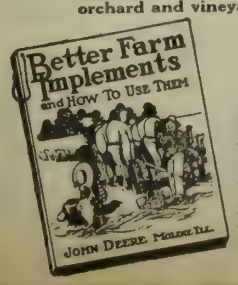
John Deere Syracuse Plows
The Plows with Perfect Fitting Parts

SYRACUSE chilled shares fit perfectly—extra shares go on easily. Share draws up snugly to its place—a smooth joint formed always.

Syracuse 601 Series, wood beam, sloping landside plows are superior for general purpose work in light soils—the 16 Series, wood beam, with side shifting clevis, for hillside work.

Syracuse J-gang plows, three bottoms, are especially satisfactory for vineyard and orchard work.

Write for free booklets. Also ask about Syracuse non-cloggable spring tooth harrows.



R. & V. Engines
Dependable Farm Power

"R & V" Triumph—always develops rated horse power—made in 1, 1½, 2½, 4, 6, 8, 10, 12, 16 and 20 H. P. sizes, stationary and portable.

Easily started; perfect speed control (speed can be varied 40 per cent without stopping engine). Complies with insurance regulations. Hopper cooled—a simple, efficient system that does not require long pipes and numerous fittings.

High grade throughout. Inspect the extra guard ring over piston pin to prevent possibility of scoring cylinder. Ask about the "R & V" oscillating magneto. Write for free booklet.

We are the world's largest builders of sixes and fours, producing virtually two cars for every one of any other concern building similar types and sizes of cars.

Obviously, the Overland Six is underpriced—is dominant Six value—comparable only with very much higher priced cars.

The rush of spring buying naturally centers upon such excess value, taxing even our unequalled production capacity.

See the Overland dealer at once and order your Six *now*.

What You Can Do for Rural Credits.

A pending proposition which shou ld be approved by farmers and farmers' organizations.

Since answering a correspondent in our last issue that rural credit propositions at Washington had not assumed form to warrant much activity in farmers' support we have learned that another measure is now pending which comes nearer to what is needed. It is Senate bill 2986 known as the "Hollis bill," which has been favorably reported by the Senate Committee on banking and currency. Orange Judd Farmer of March 11 gives an outline of it as follows:

The bill provides that 10 or more farmers in any community who wish to borrow on long-time mortgages may organize a national farm loan association. Each member must pay in $5 for one share at par for each $100 he wishes to borrow. He thereby assumes double liability, that is, he becomes liable to the association for $10 on each share. He has one vote for each share, but not to exceed 10 votes in all. Only borrowers may become members.

Each member applies for a long-time loan secured by a first mortgage on his farm worth not less than twice the amount applied for. Interest shall not exceed the legal rate. No loan for less than $200 nor more than $10,000, nor for less than five years or more than 35 years. Installments shall be paid on principal each year sufficient with accrued interest to wipe out the debt at maturity. Then the mortgage is discharged, the borrower's shares, are paid back and he is free and clear.

If the loan is approved, the association indorses it and gets the money for it from the federal land bank. In other words, the borrower has to put up a margin of 5 per cent in cash, his liability to others is limited to twice the amount of his investment, although unlimited liability may be legally assumed if desired.

The continental United States is to be divided into 12 districts, each of which shall have a federal land bank of not less than $500,000 capital stock. Joint stock land banks also are authorized to compete with or participate in the federal system.

The system is to be in charge of the federal farm loan board, a bureau in the treasury department, and consisting of the secretary of the treasury, together with four members appointed by the president with the consent of the senate. Each federal land bank may issue bonds upon the security of the mortgages it buys, the sale of these bonds to furnish additional money to loan. Any shares in the federal land bank not subscribed by the public shall be paid for from the federal treasury. This is to be reimbursed subsequently by the sales of said stock thereafter. Each national farm loan association must invest in its federal land bank's shares the cash received from the sale of its own stock to individual borrowers.

Not to exceed $6,000,000 of government funds may be deposited in federal farm land banks at 2 per cent interest in any one year, and secured by farm bonds at par. Not to exceed 30 per cent of the deposits in postal savings system may be invested in farm bonds at not to exceed par. Time drafts with farm bonds as collateral may be discounted by any bank, and shall be eligible for rediscount through the federal reserve. Shares and bonds of the system shall be free of all taxation. Bonds to bear not over 5 per cent interest.

This comes nearer to being what is wanted than anything previously favored by a congressional committee and it is very desirable that believers in rural credit should urge their representatives to vote for it. Unless thus urged it is very likely to be forgotten in the press of war and politics.

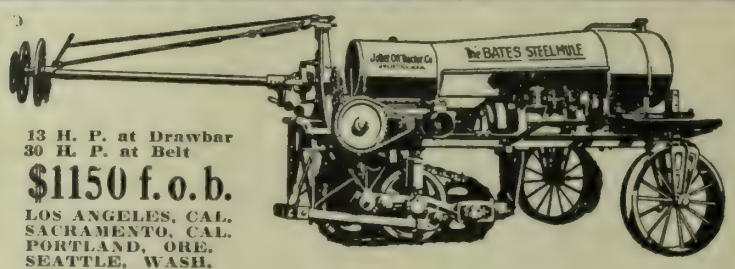
William Willoughby is planting 2,000 Blenheim apricot trees on his ranch near Kings City.

The Salof Self-Setting Gopher Trap.
Only trap having free passage. Will entirely rid your place of gophers in one season. Will catch all sizes. If you want a trap that will give results, try this one. If your dealer can't supply you, will be sent postpaid for 50c; 3 traps, $1.00. Circular free. A. SALOF & CO., 3914C 39th Ave., Oakland, Cal.

SAMSON with SIEVE-GRIP
Reg. U. S. Pat. Off. and Foreign Countries
TRACTORS

The angular Sieve-Grips act as clod-breakers and soil agitators. They crush the large, hard lumps and prepare the way for the cultivator.

One round with a Sieve-Grip Tractor and harrow gives a perfect mulch where two are usually needed.



Sieve-Grip Tractors are adapted to orchard and vineyard work because of their low, compact structure and dust-proof features:

"Six-Twelve" $725 f. o. b. Stockton "Ten-Twentyfive" $1250

Have you enough and economical power for your spring work? Let us tell you about these Sieve-Grips. Send us a card asking for our latest illustrated folder P. R.-8

The Bates Steel Mule will do more kinds of farm work than any tractor built. It is the only machine that will replace horses for every farm operation from plowing to harvesting.

The Bates Steel Mule
PATENTS PENDING REG. U.S. PAT. OFF.

No new implements are necessary—the tools you now have will do the work cheaper, quicker and better when hitched to a Bates Steel Mule. The Bates Steel Mule is propelled with a "Crawler" instead of a wheel which means that it can be used 30 per cent more days per year than an ordinary tractor. Works on any soil, wet or dry and does not pack the ground. Thousands in successful use by satisfied owners all over the world.

One Man Operates It

Look At The Pictures

The Bates Steel Mule is the only real one man machine. This feature alone saves about $200 in labor each year more than a "tractor." One man and the "Mule" will do your plowing, discing, drilling, cultivating and harvesting. On the belt it also pulls large ensilage cutters, medium sized threshers, etc.

Has a heavy duty, four cylinder motor, high tension magneto ignition, two speed transmission, hardened cut gears running in oil, and can be equipped to run on either kerosene or gasoline. This wonderful machine is backed by a broad, strong guarantee.

RIDDING FARM OF WEEDS.

[Editor's Note.—This is the third of a series of five articles on weed eradication that have been prepared by Mr. O. W. Newman, Assistant Secretary State Commission of Horticulture, and which will appear in coming issues of this paper.]

HOW TO SAVE THE FARM FROM JOHNSON GRASS.

Where Johnson grass does not occur the thing to do is to keep it out. Sow clean seed! There is great danger that sowing Sudan grass will spread Johnson grass, and the State Commission of Horticulture has investigated the possibility of procuring pure Sudan grass seed. The most satisfactory information received came from the United States Department of Agriculture, and is given below:

"There are no varieties of Sudan grass seed recognized at the present time, though there is some difference in regard to seed. This is mainly due to hybridizing influences. The Texas station has attempted to differentiate between pure and mixed or hybridized seed by indicating the former as 'cream hull,' or that which has a decidedly golden cream color. Seed with darker glumes or that tending to a reddish color, or even black, is more likely to be a mixture of a hybrid seed. This can not, however, always be depended upon. The only safe method of procedure is to purchase seed that is grown in Johnson grass free districts."

The letter supplies the names of growers of Sudan grass seed which could be guaranteed practically free from Johnson grass. We would advise those intending to plant Sudan grass to communicate with Mr. Roland McKee of the U. S. Dept. of Agriculture or with this Commission.

The Johnson grass problem in California is already a very serious one. Thousands of dollars have been spent in its attempted control and still it remains one of our worst weed pests. Hundreds of acres have been completely abandoned to it. If the most rigid care is not taken by prospective grain purchasers and seed men, still greater areas will be ruined. Witness the misfortune of the rice growers and take warning.

The only practical method of eradicating Johnson grass, so far as recommended, is thorough plowing, raking and burning. Turn hogs into the field and they will root out large quantities of the root-stocks. Rotate crops, using hoe crops wherever possible.

Keep ditch banks, roadsides and other waste places free of the weed. Do not allow it to go to seed. Screens in the headgates and ditchgates will keep out large quantities of the seed. Johnson grass and other weeds growing along the ditch banks are a serious means of spreading weed seed. Chemicals for the control of Johnson grass have not yet been sufficiently tested to be recommended.

Do not get the idea from what has been said about Johnson grass that it cannot be controlled. Although sometimes it may seem like a hopeless task, we know it can be done, because it has been done. It requires time and perseverance, and it costs money. There is no easy road to eradication, and there is much land from which it will not pay to eradicate Johnson grass by our present methods. We are now working on chemical sprays as a possible means of reducing the expense and increasing the efficiency of eradication methods, but these sprays have not yet been sufficiently tested to be recommended.

I want to include here a statement made by County Horticultural Commissioner William Wood, at the California State Fruit Growers' Convention, held at Visalia in November, 1915:

"Some may think from the statement I have given about Johnson grass and morning glory that it is a hopeless task to destroy or control them. Not so. Wherever we find a good farmer there is no Johnson grass, even though he is located under the most adverse conditions. It is the farmer who has made one or two half-hearted attempts to destroy these weeds and given it up, who says it can't be done.

I have known men who have let the Johnson grass and morning glory become established over most of their farm, and then have sold their property for less than half what it would have brought if free from these weeds. I have also known a man who bought 100 acres covered with Johnson grass. This man destroyed every root on the 100 acres in one year. So you will see the difference is in the man more than the unfavorable conditions under which he has to work * * *"

This statement is quite true. I have heard it from all sides, and always from good, hard-headed, successful business men. The weed problem is a vital one, and it is one we must constantly watch.

Things a Farmer Can Make with a Few Sacks of Cement

The farmer and his help can use their spare hours to advantage in building simple, permanent farm structures of concrete. These require no repairs; never need replacing; are lasting improvements. And they are easily constructed, with tools which every farmer already owns or can easily obtain.

Concrete Sidewalks
Much cleaner than cinders or dirt. More lasting than boards.

Concrete Fence Posts
Won't rot nor split. Properly reinforeed with steel rods, they stand any ordinary strain.

Concrete Cellar Floor
Keeps out rats, vermin and moisture. Makes the sanitary floor.

Concrete Milk House
Safeguards the purity of milk. Concrete absorbs no impurities, gives off no odors, can be washed absolutely clean.

Concrete Feeding Lot
Saves feed from being trampled in the mud. Keeps the stock's feet in better condition.

Concrete Manure Pit
Preserves all the liquid fertility of manure. A load of well-rotted manure from a concrete pit is worth two loads of ordinary manure.

Concrete Cistern
Keeps the water clean. No impurities can soak through a wall of concrete.

Concrete Dipping Vat
Every farmer needs one for the comfort and health of his stock. Cannot leak nor become foul.

Concrete Watering Trough
Keeps drinking water clean and free from the slime and splinters of decaying wood.

Concrete Barn Floor
Can be easily washed and kept clean. Never rots nor gets slimy like wood floors. Is not slippery.

Concrete Garbage Receiver
More sightly and convenient than cans, and better protection. May be moulded to permit the frequent burning of garbage.

Concrete Hog Wallow
Keeps hogs from getting plastered with mud. Becomes an automatic dipping vat.

Concrete Septic Tank
Safeguards the family's health. Prevents contamination of water. A big improvement over the insanitary privy.

Concrete Root Cellar
Prevents freezing of vegetables and fruit. Preserves them for right market conditions.

Concrete Culverts and Small Bridges
Make permanent passageways over ditches.

Concrete Chicken House
Better than wood. Rat-proof, vermin-proof, sanitary.

CONCRETE FOR PERMANENCE

Many other structures, too numerous to mention, can be built of concrete. Tell us what you want to build. We will send you help. Our book, "*Concrete in the Country*," is free for the asking.

High-Producing Dairy Progeny.

[Written for Pacific Rural Press.]

A high-producing Holstein cow has a high-producing daughter which has a high-priced son, all owned until recently by the Whittier State School.

The 10-year-old cow has just completed her year's record of 711.56 pounds fat (889.45 of butter) from 19,241.8 pounds milk. During the record period she was fed and milked by several different boys of the State School, experienced and inexperienced, good milkers and poor ones. This comes near the average of the highest five Holstein cows over 10 years old, which is 781.44 pounds fat.

The cow's name is De Kol Pietertje's Favorite Queen. She and her daughter, Whittier De Kol Pietertje, are still owned by the School. The latter's record at 5 years old is 24.09 pounds butter in seven days and 95.45 pounds in 30 days. She is now on yearly test and is making an excellent showing, being still milked and fed by the boys.

This daughter's bull calf sold at 8 months old for the price of half a dozen full-grown, high-grade cows, to Edmund D. Barry, Jr., of Daggett, Cal. That price was paid because of the records of the calf's dam and grandam. All three are beautiful dairy types.

The chief value of purebred stock lies in the practical certainty that the best characteristics will be transmitted to the offspring.

The chief value of records of production is that they show which individuals have the characteristics that are valuable not only in the individuals but also in all their offspring and relatives.

One of the chief values of purebred livestock at the Whittier State School, according to Ranch Superintendent E. B. Balis, is its effect on the young men who care for the animals. They take great interest in their work, and are likely in a few years to be showing our California livestock men a little about breeding, feeding, milking and making records.

It is certain that their association with fine cattle has a beneficial effect on their moral character, for the boys at the dairy have chosen that work in preference to other work provided by the school.

Advice on Concrete Silo Construction.

To the Editor: I see in your issue of February 26, a query from a subscriber of Stonyford asking about the cost and economy of concrete silos. I shall endeavor to answer this query through the Press, as the answer following the query is so high as to cost that it is almost prohibitive for the average dairyman.

My father and I have built concrete silos since 1902 and have upwards of 30 in southern Michigan and northern Indiana, varying in size from 10 feet diameter and 30 feet high, to 20 feet in diameter and 52 feet high, all giving the best of satisfaction.

A concrete silo, properly built, will preserve the entire contents with no waste at all except the top three or four inches, if allowed to remain very long after filling, before covering or feeding. We have found by actual experience that the proper size is 14 by 40, for all conditions. If the dairyman needs more capacity a similar silo should be added.

The walls of the silo need be no thicker than nine inches at the bottom, tapering to four inches at the top. The cost of a 14 by 40 foot silo will approximate about as follows: 42 cubic yards of concrete, divided into about 42 barrels of cement, 14 cubic yards of sand and 28 cubic yards of gravel. A barrel of cement to the cubic yard just about equals a 1-2-4 mixture of concrete.

The dairyman can figure the price of sand per yard, gravel per yard and cement per barrel for his particular locality, then add to this cost $4.00 to $4.50 per foot in height and he will have the approximate cost of a silo of 150 tons capacity.

We always allowed the dairyman to do his own excavating, and hauling of materials, because he can get his materials on hand and have everything all ready.

FOR SALE, SINGLE OR CARLOAD LOTS

KING LANCASTER,
Son of King Edward, Grand Champion Bull California State Fair 1909, 1910, 1911. The only Bull 3 times Grand Champion at State Fair.

My range-raised bulls this year are the finest lot I have ever had.

THEY HAVE GRAND CHAMPIONS BEHIND THEM.

In most cases he realizes hardly any cost for materials except the cement. **A. S. Burbank.**

[Of course our estimate of cost took into consideration the work of teams and men in hauling gravel, sand and cement, and in instances where these materials have to be hauled some distance that factor should not be overlooked.—Editors.]

Pigs Harvest and Balance Own Ration.

[Written for Pacific Rural Press.]

To let 300 brood sows and their offspring harvest and balance their own rations in some ten pairs of fields on a ranch of 200 acres is the system of G. D. Willoughby and Sons of Calexico. About 100 of the old sows are registered Durocs, largely of Eastern blood.

As nearly as convenient, each alfalfa field has its mate in grain. Barley is sown November to February, and if sown early is pastured till spring. This being cut when practically ripe late in April or early May, is stacked in its adjoining alfalfa field for the pigs to eat at pleasure. This lasts all summer. Seven stacks were used last year and there will be more next season. The stubble is irrigated, plowed, and planted to milo even as late as July. This is partly cut to feed in the head during winter, and partly hogged off. The stalks make good pasturage when alfalfa is too wet. Barley is also sowed on all alfalfa fields for winter pasture, and perhaps half of it is allowed to ripen. Pigs eat it into the ground, but do not kill it.

All pigs are fed grain in the morning. This is measured closely (not estimated) in order to know how much to give when an increase is desired as the pigs grow. "Plenty of the ranchers here are feeding the blackbirds by estimating too much grain, especially that fed in the head," says Gilbert Willoughby.

"We have farmed in Sacramento and San Joaquin Valleys and near Ventura, but nowhere else can they raise hogs as cheaply as we can. We grow all our own feed, and by our system of fields and crops, two men besides ourselves can feed everything. We expect to have 900 head on the ranch all the time, though we aim to sell all barrows when they are worth $8 or $10 each, to other people for fattening."

Succulence will be added and the ration cheapened by growing 20 acres of beets to feed the sows in brooding pens.

Hogging-off Volunteer Barley.—One field of about 25 acres was sowed to barley in the fall three years ago. It was pastured till February, when the hogs were taken off till it ripened. They then hogged it down till fall. The field was disked and furnished green feed all winter. This volunteer crop was allowed to ripen and was then hogged off as before, the process being repeated. In January, 1916, there was still a heavy growth and a thick stand of flourishing green barley.

A feature of the ranch is that the pigs are transferred to fields at an early age so there are never many around the house, but wherever one looks he sees healthy hogs busy about the open fields. Running water is provided from the irrigation ditches, being run through settling ponds.

ROARING HORSES.

Whistlers, wheezers, blowers or roarers. These uncomplimentary terms were not applied in anger, but merely used to indicate the character of the unsoundness in horses, known as roaring. Their use may be avoided by saying that the horse is afflicted with laryngeal hemiplegia. Horses affected with this disease appear normal while at rest, but when severely exercised the breathing efforts become much greater and the characteristic noises are heard. Ninety per cent of the cases are caused by partial paralysis of the muscles of the left side of the neck. It may be cured in a great majority of cases by an operation on the larynx. The operation is not dangerous if performed by a skillful veterinarian. Most cases are ready to be put back on work in course of eight weeks.—Carl N. Kennedy, Horse Specialist, O. A. C.

DAIRYING.

The annual meeting of the Stanislaus County Cow Testing Ass'n was held at Modesto last week.

A number of Holsteins on the Stanford University's ranch at Vina are being officially tested.

The 120-acre dairy ranch, owned by M. Rosing near Tipton, Tulare county, is being equipped with modern dairy barn and milk house.

A meeting was held in Orland last week to consider the new dairy laws and their application and to take final steps toward the organization of a cow-testing association.

Many silos in the Compton district of Los Angeles county have been empty several years; but dairying and alfalfa are again beginning to replace beets.

Practically all of the cows at the Whittier State School are in the A. R. O. or are entered for A. R. O. records, according to Farm Supt. E. B. Balis.

At the annual election of officers of the Porterville Co-operative Creamery last week, V. D. Krupp was elected president, L. M. Owens, vice-president, and C. O. Premo, secretary-manager.

The California Central Creameries Co. of San Francisco have definitely decided to erect a creamery at Chowchilla this year. It is stated that there are 2,000 cows in that section at this time.

Due to the high price of hay, the great many dairymen are beginning to cut their first crop of alfalfa and feeding it green, in Stanislaus county. Those who are pasturing their cows are watching them very closely to guard against bloat.

R. E. Watson of Modesto, manager of the Rancho Dos Rios herd of registered Jerseys, reports that he will hold an auction sale sometime during April or May of about 30 head of purebreds. This is the oldest herd of registered Jerseys in California and also the largest. These two factors should make it possible for Mr. Watson to offer some of the choicest Jerseys ever sold at public sale in the State.

With a production of 74.8 pounds of fat from 1348 pounds of milk, the Jersey cow Empress Lass, owned by N. H. Locke Co., again headed the list of cows in the San Joaquin County Dairymen's Ass'n for the month of February. Of the 15 cows in the testing association producing over 45 pounds of fat for the month the N. H. Locke Co. owned five; E. B. Goodwin, six; Mrs. E. C. Clowes, one; County Farm, one; C. A. Beecher, one; and J. DeCarti, one.

Plans are now complete for the official testing of Holsteins on the Millbrae Dairy, in San Mateo county, on a large scale. A new test barn with box stalls for eight cows has just been completed and is a model of convenience. Mr. Robb, Jr., who will have charge of the test cows, states that they will test all of their purebred cows as fast as they freshen from now on. There are about 150 head of registered cows on this farm which will be increased to 300 head. The herd is now headed by a son of the King of the Pontiacs.

Alexander and Kellogg, Milking Shorthorn breeders of Suisun, write that they have just returned from a trip East where they purchased three registered cows, five heifers and a bull. One of the cows, Rose Fairfield 2nd, was undefeated in six fairs during 1915 and has a record of 10,045 pounds of milk in 300 days, and all of them are of exceptionally high quality. The bull they purchased was Glenside Coming Star, out of an English cow, Welcome Lass, who produced 13,560 pounds of 4.1 testing milk with her last calf. The bull is sired by Bradford Prince. Over $12,000 is said to have been paid for the nine head purchased.

SWINE.

For some time several Los Angeles buyers have been busy in Imperial Valley buying hogs and the Valley at present is pretty well cleaned up.

Bedell and Sons of Roseville have established a very choice herd of registered Berkshires on their ranch just west of that town.

W. T. Gatton, the Hampshire swine breeder formerly located at Gardena, has moved his herd of purebreds to Calexico, Imperial county.

Felton and Hoyt, Duroc Jersey breeders of Hanford, now have 16 brood sows and two fine boars, but expect to have a herd of 50 sows by fall. They believe in culling rigidly, offering only the tops for sale for breeding purposes.

A choice herd of registered Berkshires are being added to the Elder Creek Dairy Ranch near Sacramento as a side line to their registered Jersey cattle. Mr. Smith, the proprietor, believes there is more money in good stock than in scrubs.

A swine breeders' association to be known as the Tulare County Swine Breeders' Ass'n was formed at Tulare March 4. Thirty-five hog growers were present, J. L. Nickerson being elected temporary vice-president and Arlington Smith, temporary secretary.

Highly crossbred pigs sold at weaning time to feed for pork are a profitable side line for A. G. Masten of Gardena. One litter of 11 pigs was sold at birth for $3.50 each, to be delivered at six or seven weeks old.

E. F. Curtis of Napa informs us that he has just received a Duroc Jersey gilt, bred to Colonel Protection, from C. P. Dexheiser, of South Dakota. Her grandsire is King of the Colonels and it is said by Eastern judges that she is one of the best Durocs ever sent West.

H. P. Slocum and Son of Willows report the sale of seven registered bred and open Duroc gilts and two boars to the Fontana Land Co., of Fontana. This firm is doing a great deal to aid the purebred swine business in the State and the Slocum purchase should be of value to them in their work.

Mr. A. Boyd of Silsbee, Imperial county, has found purebred Duroc Jerseys a profitable investment. His first sow raised a litter of 12 pigs and two of her offspring eight months old are now nursing litters equally as large. Mr. Boyd says that the profits from Durocs are larger than he anticipated.

The Berkshire breeders of Yolo county have organized the Yolo County Berkshire Association with F. B. Armstrong as president, G. H. Hecke, vice-president, and A. H. Brinton, secretary-treasurer. They plan to hold a spring sale of Berkshires at Davis. The next meeting of the association will be held March 18.

C. B. Cunningham of Mills, Sacramento county, has received five Chester White sows from the East and a six-month-old boar. Four of the sows are bred to sons of Wonder, who is said to be one of the best boars of the breed. The other one is bred to St. Elmo, who was a four time grand champion. The boar is out of William A., grand champion at Minnesota State Fair.

Word has just been received from Prof. J. I. Thompson, secretary of the California Swine Breeders' Ass'n, that a consignment sale of all kinds of hogs will be held at Chico, May 24, in connection with the Butte County Spring Exposition. Animals will be consigned from some of the best herds in the State. Particulars concerning the sale can be secured from Prof. Thompson, Davis.

J. A. Crawshaw of Hanford advises us that he has purchased from the middle west one boar and two sows of the Spotted Poland China breed. He says they are fine individuals and the first so far that he knows of in California. He will compare them with the black Poland

LIVESTOCK DIRECTORY.

Rates in this directory, 3c per word each issue; or if carried weekly for one year, 2½c per word.

SWINE.

BIG TYPE POLAND CHINAS—One to a carload. Any age, either sex. 600 on hand. They have plenty of size, extra good hams and shoulders, strong arched backs, great length, depth and thickness of body, with good looks as well. Many are sired by IOWA WONDER, a 1000-pounder in show condition. I believe his pigs are the best in California. Visitors say they are the best they have ever seen. He sires the kind that grow faster and larger, have more, better and stronger pigs, and are more practicable and profitable—the kind that are highly satisfactory. Extra special prices on account of being overstocked. I have hogs galore Prices will surprise you Satisfaction guaranteed Write Geo. A. Smith, Corcoran, Cal.

Chinas as to economy and prolificacy. The Spotted Poland China is commanding a great deal of attention in the middle west at this time and the result of Mr. Crawshaw's experiment will be watched with interest.

HORSES.

A. L. Meredith, manager of the Rowland Ranch at Puente, has purchased the registered jack, Knox, from Thos. Murphy of El Centro. There are 20 mares on the Rowland Ranch at present, which number will be increased to 50 in a short time.

Henry Wheatley of Napa reports the sale of two aged Shire stallions, one to Jos. Williams Jr. of Contra Costa county, and one to Pat Walsh, Austin, Nevada. Mr. Wheatley states that these two sales completely depletes his offering for this year and that he could sell more if he had them.

The Blackhawk Stock Farm at Burlingame has just sold the stallion Anwick Arthur to R. F. Frisby of Thornton, San Joaquin county. Mr. Ward, the manager, says that he believes the sale price to be one of the highest ever received for a Shire stallion in this State. The horse has been a remarkable foal-getter on the Blackhawk Ranch, having earned an average of $800 annually in outside service fees besides siring approximately $14,000 worth of colts for Messrs. Easton and Ward. Mr. Ward says they will show 20 head at the State Fair this year. They have also recently sold Blackhawk Marvel, a two-year-old stallion, to Mr. Boone of Danville.

MISCELLANEOUS NOTES.

Reports from Orland state that there have been very few losses in lambing since the late heavy storms.

A rice company at Willows, Glenn county, intends experimenting with rice silage this year, as a feed for dairy cows. It is said that 12 tons of rice forage can be grown to the acre.

The Morton Turbine Pump Is Your Logical Choice Because—

It saves you money in initial cost of pumping plant.

It pumps more water with less horse power.

It pumps 250 gallons per minute from a seven-inch well.

It pumps 1000 gallons per minute from a ten-inch well.

It pumps 2000 gallons per minute from a twelve-inch well.

Every bearing is protected from sand and water and is lubricated by force feed.

The best well—the sandy well—is the home for the MORTON TURBINE PUMP.

More Butter and Better Butter

YOUR HERD should average at least 500 lbs. of butter per year. A good Jersey herd will do even better—600 lbs. per year, and the butter will be of the finest flavor, texture, and color. There are many individuals of this breed producing 1100 lbs. They make good use of every ounce of feed, do not require fancy feeding, mature early, thrive in any climate, are steady producers, are beautiful and gentle. They pay big dividends on the highest priced land.

Our latest free book, "About Jersey Cattle," tells all about the development of this hardy breed. Send for it—*now*. You'll be glad you did.

[Subscribers wishing an immediate reply should send money order for $1.00. No charge for questions answered through this department. Name and address of subscriber must accompany each query.]

ANSWER TO W. L. M., SONOMA.

[This cow has rheumatism. Give two pounds epsom salts in one gallon of warm water.]

SHOULD SELL COW.

To the Editor: I have a six-year-old cow that will not breed. She has been bred repeatedly, but after two or three months will come in heat again. Have changed bulls but with no result. What treatment would you advise?—W. D. S., Merced.

[Dispose of this animal.]

BROOD SOW SICK.

To the Editor: I have a brood sow due to farrow in about a month. It seems to hurt her when she tries to eat. She eats very little and holds her head to the ground most of the time. Can you tell me what is the matter?—J. W., Turlock.

[This sow's trouble is due to her condition, which will be relieved when she farrows.]

OPERATION FOR A LEAKY TEAT.

To the Editor: Please describe the operation necessary for a leaky teat.—E. E. G., Merced.

[Operation for a leaky teat consists of the removal of a very small V-shaped piece of skin from the teat orifice. The wound is sutured and the resulting contracting narrows the opening.]

SOW HAS RHEUMATISM.

To the Editor: Have a sow that seemed to lose control of one hind leg about a month after farrowing. She was constipated and had a high fever and I put her in a dry shed with dirt. Now, her hind feet cross and she lies down nearly all of the time. What can be done for her?—O. R. L., Gilroy.

[Your sow has rheumatism. Give her 10 grains of hexamethylamine once a day with a like amount sodium salicylate.]

MAY BE ANTHRAX.

To the Editor: Last fall I lost several shoats. The first symptoms were, swelling of throat or one side of the jaw, containing hard formation. As it developed it looked very much like a bad case of quinsy and usually lost them the day after they were taken with the disease. What was the trouble?—G. M. W., Manzanar.

[This looks like anthrax.]

MARE WITH WORMS.

To the Editor: I have a mare that has pin worms very badly. They are not in her stomach, but in just the last passage of her intestines, too far back for any worm medicine to reach. What can be done to get rid of them?—V. T. A., Merced.

[Inject one quart water with an ounce of salt in her rectum, two or three times a day.]

BULL HAS INJURED PENIS.

To the Editor: I have a young bull whose shaft was bleeding when he was last used. Since then the inner sheath has swollen in such manner that I can't use him and the pouch has a tendency to hang out most of the time. Can you advise me what the trouble is and how to cure him?—C. A. R., Maxwell.

[Your bull has injured his penis. Inject 1-1000 potassium permanganate in his sheath once daily.]

COW SICK AFTER CONSTIPATION.

To the Editor: I have a cow that became constipated after changing her ration from clover and rye hay to second crop alfalfa. I gave her a physic, and she got over it, but now I notice she does not pass water freely. When I feel her left side it seems to be hard inside. Would like to know what to do for her.—C. Z., Fort Jones.

[Give your cow one ounce fluid extract saw palmetto daily for four days.]

HORSE WITH PARASITE.

To the Editor: I have a horse colt that bites his flanks, turns round in circles and kicks high in the air. Has been doing this for eight months. His skin seems to itch, but I can see no signs of mange or lice. I feed alfalfa hay and grain. Can you tell me the probable cause?—N. B. W., Thalheim.

[This colt is troubled with some parasite. Wash him off with lime sulphur dip at intervals of seven days.]

MILK FEVER.

To the Editor: My cow freshened two weeks ago and has had milk fever twice since. I had a doctor both times who pumped air into her bag both times and gave her a capsule the last time. She has been running off the bowels for three days now and will not eat anything. Seems to be in pain for she moans a great deal, but can get up without trouble. What can I give her for relief?—A. A. Sebastopol.

[Give one quart raw linseed oil and one dram three times a day of fluid extract nux vomica.]

FARMER STENZIL'S RANCH OF 1000 WONDERS.

(Continued from page 347.)

of over 20 pounds of butter. That's not bad, is it? But I'll give them all 20 pound records before I'm through, yes sir, every one of them, and I've got several likely thirty pounders. Korndyke Ormsby Hengerveld 2nd over there made 28.91 pounds of butter for me last year as a five-year-old, but she'll do better. Her two-year-old heifer over here goes on test next week and I'll be a badly fooled man if she doesn't make better than twenty pounds with her first calf."

Ambition Aroused.—At last we had awakened that spark in this Farmer Stenzil which shows his

Price and Value

It isn't what you put into a Silo, but what you get out of it that counts.

WHEN YOU OPEN UP YOUR SILO, you will get the real proof of silo values. If you have an Ideal Green Feed Silo, your silage will be good. You can rest assured of that. But if you have one of the so-called "cheap" silos you will get proof of the fact that good silage cannot be produced in a poor silo. Good silage is what you want. Poor silage is worse than none at all.

REMEMBER that after you have your silo erected and your corn stored in it, there is no getting your money back for either the silo or the corn crop that has been wasted. The assurance of good silage that

THE IDEAL GREEN FEED SILO

gives you is well worth the cost. When you consider how many more years the Ideal will last, and give you good silage every year, there is no question of its being worth far more than any other.

THE FEW DOLLARS a man may hope to save by buying a "cheap" silo will very likely be the cause of his losing, through poor silage and the short life of the silo, many times the amount he seemed to be saving on the first cost. Your good judgment should warn you against taking chances of losing your feed by putting it in an inferior silo.

THE REASONS why Ideal Green Feed Silos preserve the silage better and last longer are completely explained and illustrated in our large silo catalog, a copy of which will be gladly sent you upon request. It will pay you to ask for this catalog before you finally decide on what silo to build.

A Better Make Not Made

For Water Deep Under The Ground

Jackson Deep Well Turbine Pumps give continuous and efficient service. They do not get out of order as they have no valves or plunger rods. Very little care or attention needed as they are oiled from the surface. Are much lower in cost than other types of deep well pumps when the expense of dug pits, cribbing and timbering is reckoned. They raise water from the very bottom of the well, thus eliminating heavy vacuums and delivering all the water the well yields. They develop slow wells and increase their flow.

Like all Jackson Made Pumps These Deep Well Turbine Pumps Are the Very Best Pumps Made for the Purpose—They are Dividend Earners, Not Expense Makers

Whatever your water problems may be our Expert Pumping Engineers will help you out free of charge—write

P & O
New Victor
Combined Cultivators

Recommended for use anywhere. Has balancing lever and two depth levers; has handles and seat, and can be used as a walker or rider. Pivot Tongue Attachment furnished when wanted.

Axles telescope in steel tube, giving adjustment for wide or narrow track. Saw-toothed ratchets give minute depth adjustment, and afford quick action in raising gangs. Counter-balancing springs on gangs can be regulated for light or heavy gangs. Jointed seat rails; seat can be thrown over out of the way when walking. Low hitch with high clearance. Cone pivot gang couplings permit taking up all wear. Gangs can be set up or down to level for different depths. Gangs can be set for close or wide cultivation. 42-inch wheels with concave tires, removable dust-proof wheel boxings, hard oil screw caps, with collar and linch pins inside the screw caps. Furnished with any standard type of P & O gangs, with spreader.

The P & O Victor is strong without excessive weight, has all needed adjustments, is easy to ride and use, will do work of the highest efficiency, and has great wearing qualities.

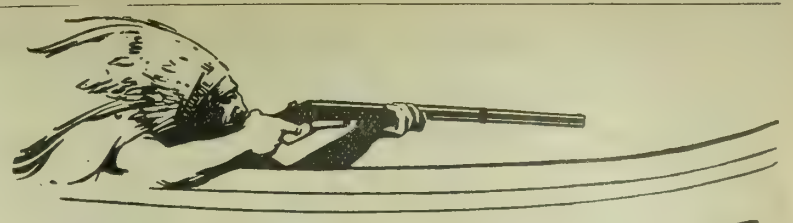
BLAKE, MOFFITT & TOWNE

Dealers in PAPER	37 FIRST STREET, Blake, Moffitt & Towne, Blake, McFaill & Co.,	SAN FRANCISCO Los Angeles Portland, Oregon



true viewpoint of things. Information came now without prompting or suggestions. He was on ground where he could visualize, where that active brain of his could see an opportunity to build. Purebreds have a habit of exciting new ambitions in a man who is naturally a builder and it wasn't surprising that Farmer Stenzil's enthusiasm got the better of his modesty long enough to relate in detail the records of some of his best cows.

Nor were we unduly surprised when he told us of his new herd bull, just brought from the east at a pretty figure, a son of King Korndyke Sadie Vale, whose first six daughters averaged over 24 pounds of butter in seven-day tests. Probably that bull doesn't appreciate all that is in store for him, but if he could just know how much reliance Farmel Stenzil is placing on him in his brick-laying fashion, we feel sure that animal would be too proud for a stranger to go near, feeling, with a perfect right, that to be one of the main cogs in that constructive machine requires out of the ordinary ability.

But don't think that ambition has got the better of sound business judgment with this diversified creator. He isn't keeping purebred cows to gratify any whim or fancy, but because it pays. He long ago figured what it costs him to feed a cow and pay interest on her investment, as well as on buildings, etc., and while his calculations were doubtless made in dollar terms originally, they were given to us on the spur of the minute in terms of gallons of milk. "It takes just about one and three-quarters gallons a day at 15 cents a gallon to pay the running expense, plus interest and so on per cow," was the way he put it. "Then you're making pretty good money out of the dairy," we suggested. "That's right," he replied, "the dairy is paying me well. And of course there's the fertilizer. That's quite a factor on this ranch, and last year I covered 75 acres from the dairy. Most of it went on the rhubarb, as that's a strong feeder, and we used to have to buy manure in the city for it."

Needs a Name.—As we look back over that short but busy day's stay on Farmer Stenzil's ranch, trying to find a weak spot somewhere, we can call to mind only one omission worthy of criticism; the ranch has never been named. Perhaps while it was being pieced together into its present large proportions, giving it a permanent name was impracticable because of its changing disposition. Many a name that fits a short-panted boy don't go well with a six-foot-two man, and the same probably holds true with a ranch.

But now Farmer Stenzil's ranch is of man's size caliber and if the writer had his way, that office, with it's prepossessing outside appearance, would have just one more adornment which would read like this: "Office"—"One Thousand Ranch." The "One Thousand," you see, is appropriate, because it suggests bigness, whether applied to enterprises, men or acres, and all of those things are embraced in that ranch. We'd be sure to have the word "Office" stuck around somewhere, because—well, what else can it be if it isn't for ornamental purposes?

Poultry for Profit---Producing and Marketing.

MATURITY OF FARM POULTRY.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

The question very often arises as to what variety of poultry will give the best results to the farmer.

Now the average farmer is not, as a rule, situated close to the market, nor has he the time to specialize as an egg producer. Therefore, what he needs is a dual purpose fowl; one that will lay a profitable number of eggs and then bring a reasonable price when sent to market.

I have told you many times that all of the large breeds of hens lay a colored egg; also that all large breeds without exception have red ear lobes, so that when you buy you will understand what kind of eggs these hens will lay.

Some people cannot understand why a White Rock or White Orpington does not lay a white egg the same as a White Leghorn. Color of plumage plays no part in the color of eggs. The ear lobes are the best signs to follow.

Heavy Breeds.—In the large breeds there is much more choice among the dual purpose fowls than among the small breeds. Some breeds do better in our climate than others, but they all have friends and can be made profitable.

The Black Langshan, which from its heavy-feathered legs and abundance of feathers would very naturally be supposed to do better in a cold climate, is bred in Pasadena and Los Angeles by people who make good claims for them.

The Brahma is next in size and feathers and these majestic birds make as good roasters, but, like the Langshans, are a little bit too heavily hampered with weight and feathers to be very popular in this climate.

What the farmer wants is a fowl that can carry some flesh and still be active, lay a good average number of eggs that will prove fertile and hatch. Very large breeds of any kind of poultry or water fowl lay more infertile eggs than those of medium size and weight. This should always be borne in mind. It is true of turkeys, geese, ducks and poultry.

Age of Maturing.—There is little difference in the age of maturing pullets of the different breeds, the very large breeds being the slowest to mature. The Faverolles and Rocks come next, but even here it is not so much the breed as the strain and the man who cares for and feeds the pullets. Leghorns are supposed to mature and lay in five months, but I have known of cases where they did not lay till eight or nine months. With proper feeding Orpingtons and Wyandottes will mature and lay almost as young as Leghorns, because they grow fast and do not run the flesh off their bones. But even with neglect they will lay at seven months if they have any range at all where they can pick a little.

Leghorns are supposed to mature in five months, but often run up to seven and eight months. This may be caused from having a strain that has not been selected for early maturity, from wrong feeding or poor housing. And the same thing would cause the large breeds to mature late, even though they came from an early maturing strain.

So this early maturing of birds is almost always a matter of properly caring for and feeding the stock, no matter what the breed may be. This question is brought up here because so many people are really afraid to buy the fowls of their choice because some one has told them that such and such a breed does not lay till it reaches a certain age.

When It Pays.—Early maturing is not always advisable because sometimes it is at the cost of health, in small breeds, and size in the large breeds, so that it is always better to feed first for health and size and second for early maturity.

A small-sized hen from any of the breeds that call for a hen weighing seven to eight pounds will lay quite as many eggs, but when you come to dispose of her for market there are not so many pounds to weigh in at a good price.

PROMISING FUTURE.

[By Geo. H. Croley.]

We have received a copy of Game Farming for Profit and Pleasure, a beautifully illustrated booklet of 64 pages, by Clement B. Davis. It treats of the wild turkeys, grouse, quail, partridges, and wild ducks; with special reference to their food, habits, control of natural enemies, and the best methods of breeding.

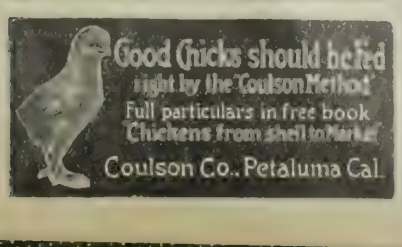
The time is fast approaching when the domestic raising in California of what is now termed wild game may become a great source of profit. Our local conditions are generally so much more favorable for the successful and profitable production of these wild fowls than in other states—where these birds are now extensively bred in captivity—that the establishment of a good eastern market for them for table purposes is only awaiting a supply extensive enough to attract attention and warrant the employment of the ways and means of marketing.

When intelligently bred and properly cared for, these wild fowls multiply with great rapidity. It is stated that one pair of any species of quail and its progeny, at a low estimate, would produce over five million birds in eight years if there were no losses. In a wild state, the great loss occurs in the destruction of all but a few of the eggs by a multitude of enemies which can be guarded against when the birds are reared in captivity or semi-captivity.

This booklet is published by the Game Breeding Department of the Hercules Powder Co., Room 155, Wilmington, Del. For the accommodation of the readers of this publication, we have arranged to have a copy sent free to those who write to the Hercules Powder Co., Chronicle Bldg., San Francisco, and mention the Pacific Rural Press.

SOME REASONS FOR POOR ARTIFICIAL HATCHES.

[By Geo. H. Croley.]



In operating an incubator it is usually a safe plan to carefully follow the directions that are furnished by the manufacturer with the machine. However at times some advantage can be gained by a little independent experimenting provided too many innovations are not undertaken at a time.

A number of very careful experiments have recently been conducted with a variety of incubators and the following general suggestions based upon the results of these experiments may be of value to those operators who, because of unsatisfactory results, are inclined to experiment for themselves: Excessive ventilation through the incubator and too much cooling and turning of eggs during the first 12 or 14 days of incubation caused many strong, fertile eggs to die. Eggs should not be turned or cooled off during the first three days; turn them once a day and cool for 10 to 20 minutes—according to the temperature of the incubator room—but once daily from the fourth to the tenth day; turn twice daily and cool, at each turning, from 10 to 20 minutes from the eleventh to the fourteenth day; turn three times daily and cool 15 to 30 minutes at each turning from the fifteenth day until the eggs pip; then close the incubator, and keep it closed, until the chicks have hatched. After the fourteenth day provide increased ventilation through the incubator and maintain an ample supply after the eggs have pipped and the eggs are no longer aired outside of the machine.

Too rapid or too great ventilation directly through the bottom of the incubator often causes vigorous, well-

developed chicks to die in the shell on the twentieth day of incubation because too much of the carbonic acid formed in the process of incubation, escapes. This acid, diffused in the damp air about the egg, is necessary to condition the shell so that it may be easily broken by the chick at hatching time.

An improperly prepared nest for a setting hen produces the same result. If the nest material is so coarse that it will not pack well, the eggs receive too much oxygen and the carbonic acid gas runs away through the openings between the coarse nest material.

When dressed, ducks are plumped by plunging them into a tub of hot water for a moment and then into cold water until the animal heat is expelled.

Poultry Breeders Directory

Rates in this directory, 3c per word each issue; or if carried weekly for one year, 2½c per word.

2000 WHITE LEGHORN PULLETS, 3 months old. Price according to quality. All kinds of breeding and laying hens, roosters and pullets. Petaluma incubators, new and used. Send For A Sample Of Calmade Graduated Poultry Fence

10 inches graduated in mesh from ½ inch to 1⅜ inches then 20 inches of 2¾ inch mesh, topped by 4½ inch mesh for the height of the fence.

The Fence Without a Sky Line

It is the most economical as well as the most practical of all poultry fences. It costs no more to buy than the old style poultry netting and costs much less to put up.

It is the only fence made with a bottom mesh smaller than one inch. It will turn the smallest chickens. Because of the straight line, continuous weave of "CALMADE GRADUATED" Fence, baby chicks won't hang in it, large fowls can't climb it.

"CALMADE GRADUATED" Fence will not slip at the joints nor unravel when cut. Uniform in weave and width. It unrolls flat as a board—it is easily put up and stretches without bulge, kink or bend on posts 16 feet apart. Learn all about these advantages and let your next fence be a "CALMADE GRADUATED." Write at once for free samples of wire used, free illustrated folder and name of nearest dealer.

The Home Circle Page of the Pacific Rural Press

MRS. BEST'S LETTER.

My dear Friends: The Fashion Shows are on in full force and even if we cannot indulge in any of these wonderful new creations we can get ideas to use in our home dressmaking.

One very new idea was a cloth combination of blue serge and white serge with a hair-line of blue in it. The gored skirt was of the striped goods with a broad band of the solid color while the waist was of the solid color with large revers of the stripe. It suggested endless combinations of materials.

Black and white checked suits are evidently going to be very popular—ranging from a very indistinct check to one that is so noticeable that all your friends would know you by your suit as far as they could see you.

For simple afternoon dresses, the shops are showing prettily flowered voiles and crepes in inexpensive materials which would want to be made in the new full skirts, either plain or ruffled and rather snug fitting waists very closely resembling the dresses our grandmothers wore. There are very good-looking collars to finish the necks offered very reasonably, some of them regular fichu effect with ends extending to the waist.

While the necks of the dresses are low, there is no indication of short sleeves—everything whether dressy or utilitarian is long-sleeved and sometimes a deep ruffle that almost covers the hand.

For better dresses, the new awning stripe silks are very effective—the stripes are fully three inches wide and there is at least one thing in their favor—they would need no trimming. Rose is without doubt the leading spring color. You see it in sport suits, sweaters, taffetas, scarfs and hats and some of the very newest blouses are made of rose linen with collar and cuffs of white and white crocheted buttons. These blouses are certainly attractive but rather formidable in price, due, no doubt, to the fact that they are new, but they could be copied at very little expense.

There are always lace waists or lace and crepe combinations for dressy wear and one of the newest conceits is a peplum waist to wear on the outside of the skirt. The stores are showing very attractive lace camisoles, or, as we have always termed them, corset covers, for wear under these thin waists.

Capes or cape effects are seen on a great many garments, from the semi-tailored coats to the soft taffetas. In many cases, they are wonderfully quaint and pretty.

In the shoe shop windows, the high shoes seem to be leading in favor, but with the popularity of spats I think we are sure to have the low shoe in use again. The spats or gaiters can be purchased in various colors to harmonize with the costume.

Next week we will discuss the Easter bonnet. Devotedly,

Rosabella Best.

(Note—Readers wishing information from Mrs Best, care of the Rural Press, will receive a reply if they enclose a stamped addressed envelope.)

APPETIZING LENTEN DISHES

The following recipes will be acceptable to those who are abstaining from meat and also those who find a welcome change in fish and egg dishes.

Sardine Loaf.—Take one can large sardines, two eggs, two tablespoonfuls melted butter, two cupfuls bread crumbs, pinch of cayenne pepper, and salt to taste. Mix all together well, turn into oblong pan, cover and bake one hour. When cold cut in thin slices. This is excellent for sandwiches or served cold as a luncheon dish.

Creamed Salmon.—For creaming salmon or other canned fish, shred the salmon with a fork and serve hot on toast in a thin white sauce composed of two melted tablespoonfuls of butter into which is well stirred a tablespoon of flour. Add very gradually, a cup of milk, with ¼ teaspoonful of salt and a dash of pepper. Beat until smooth and creamy.

Curried Eggs.—One slice onion two tablespoons melted butter, one tablespoon flour, one teaspoon curry powder, ¼ teaspoon salt, 1¼ cups milk, five hard boiled eggs, cut lengthwise in quarters. Brown the onion in the butter and add the flour; stir in the milk, stirring until it thickens and season with pepper and salt. Add the eggs and cook long enough to heat thoroughly and serve at once with hot boiled rice.

ORANGE DAY.

On the day this copy reaches you, California will be celebrating Orange Day. While generally the most enjoyable way to use that fruit is without any preparation, eating it from the hand, still a few recipes may not come amiss.

Orange Marmalade. — Orange marmalade is a very delicious preserve to serve with toast for breakfast or with muffins and tea in the afternoon to a visiting neighbor. Take one doz. oranges, four lemons; wash and slice very thin, being careful to remove any seeds. Put in granite pan, cover with 4 qts. cold water and let stand over night. In the morning, after boiling two hours, add 8 lbs. white sugar and boil about an hour longer or until it will jell. Put in glasses and cover with paraffine.

Orange Cake—One cup sugar, ½ cup butter, 3 eggs, ½ cup milk, 1½ cups flour, 1 teaspoon soda, 1 teaspoon cream of tartar, grated rind of orange. Cream sugar and butter, add the well beaten yolks of the eggs, then the rind of the orange. Stir in the milk and flour (with cream of tartar and soda well mixed in) alternately, then add the stiffly beaten whites of eggs last—folding them in very carefully. For the frosting—take 1 cup powdered sugar, piece of butter size of walnut creamed together; two tablespoons orange juice, enough milk to stir, then beat well—no cooking. This form of frosting spreads very well with much less effort than the boiled icing.

Fruit Punch.—Two cups sugar, 4 cups cold water, 2 cups chopped pineapple or 1 qt. can, 1 cup orange juice 1½ cups lemon juice. Boil water, sugar and pineapple 20 minutes. When cool, add fruit juice and dilute with water. Other fruits, such as bananas, or cherries can be added if so desired.

PREVENTING DEAFNESS.

Medical science seems to have made little progress in the cure, or rather the prevention of deafness. In many cases the trouble develops so gradually that the first stage, which is often congestion, has been passed before medical advice is sought. It is in this first stage that help can often be secured, while later, there is no relief except the use of mechanical contrivances and these are not always helpful to everyone.

All children who have a tendency to catarrh or ear troubles should be watched carefully — they should never have water run into the ear and should not be allowed to sleep in a direct draft.

SWEET PEAS.

The growing of sweet peas successfully is not always accomplished, due very largely to wrong methods.

For early blooms, peas should have been planted last autumn, but it is not too late to plant now for mid-summer blooming. Sow the seed in trenches at least six inches deep and cover with about an inch of the soil thrown out when the trench is made. When the plants are about three inches high, fill in around them with more soil and keep adding as the plants grow until all the soil has been returned to the trench.

The object of this is that the roots of the plants need to be deep in the ground to insure coolness and moisture during the mid-summer heat.

For support, brush about six feet tall with branches close to the ground is good if you can secure it; if you cannot, coarse meshed netting fastened to stout posts will be very satisfactory.

The soil should be of moderate richness and as the plants grow, either well rotted stable manure or bone meal should be added.

The two insect pests that trouble peas the most are the red spider and the aphis or green plant louse.

If the vines are infested with the red spider, the lower leaves turn white and spraying with clear water is about the only remedy. For the aphis, you will need a nicotine spray to be effective.

Do not make the mistake of using inferior seed, as the effort of growing poor flowers is no less and they do not prove satisfactory.

There are very many varieties of seed on the market. One of the best is called the "Spencer" which comes in many dainty solid colors. It has large fluted petals and is very fragrant.

THE PUPPY AND THE CARPET-SWEEPER.

Do you see that awful Monster
That Nora just brought in?
The sight of him's enough to make
A little pup grow thin.

He eats up ev'rything he finds
Upon the carpet there.
I jump, and growl, and bark at him,
But little does he care;

I've had that thing attack poor me,
Without the slightest cause;
When I was on the rug, he jumped
To gobble up my paws!

If Nora hadn't held on tight,—
As tight as she could hold
To that long round hard tail of his,—
This tale had not been told.

It's all that Nora,—strong, brave girl!—
Can do, to hold him tight;
At last, though, she can conquer him,
And put him out of sight.

She shuts him in the closet small,
Where it is still and dark;
And I'm so glad, I sit outside
That door, and bark and BARK!

—Ray Russell Jewell, in Little Folks.

HOW FAT SUSIE HELD ON.

Roguish, brown-eyed Mud Murdock waited until Miss Ridley's back was turned and then deftly threw a bit of twisted paper on Susie Ward's desk. When she innocently flattened it out, it proved to be a drawing of a fat, fat child under which Mud had printed in big crooked letters so that there should be no doubt in Susie's mind, "This is you!"

Susie gulped, blinked rapidly, and turned a gorgeous poppy-red. Then she rushed to work on her tomorrow's spelling lesson so that Mud should not know how keenly she felt about his picture. In spite of her best efforts to study, however, the words danced up and down on the printed page. Suddenly a silver tear from somewhere dropped down on the head twenty-second lesson. Susie rubbed her eyes with her little linen handkerchief and was sure she was the unhappiest girl in the world.

"I'd exchange places with any girl in this school," she thought bitterly, "except perhaps Hattie Tibbetts, as I'd rather be fat than dirty." You see, Susie's plumpness was the great sorrow of her life. But strange to say, there were no less than three girls in her class gazing enviously at her clear, rosy complexion, her heavy golden curls and immaculate white middy blouse and trim blue serge skirt, and wishing that they were Susie Ward.

The morning dragged away slowly. Susie and Dusty Gray took the whole sixty minutes of the arithmetic period to finish the eight problems which slim, gypsy-like Adelaide Spinney and Mud Murdock easily completed in fifteen minutes. Susie felt a little better when Miss Ridley announced that she and Dusty had the only two perfect papers, but her round little face clouded over again when Miss Ridley said absently, "Susie, will you please run down to Mr. Alexander's office and get some gray paper?" and she had started up eagerly, to have Miss Ridley add, "Perhaps, as I am in such a hurry, Adelaide had better go."

Susie crouched down over the map of Asia to hide her red face from the eyes of her schoolmates. Suddenly

the fire-gong clanged—not the slow "one, two, one, two," which meant to go slowly to the dressing-rooms and get your coats and hats, but the quick "one, two, three, one, two three," which was the summons to pass out in haste.

Susie took the hand of the child next to her, who happened to be Dusty Gray, and joined the row of children who were filing decorously out in pairs.

Miss Ridley glanced with wrinkled brows at 6B, from whose doors not a single child had yet come, and said crisply: "To the front stairway. Wait for the first-grade children to get out first." Susie and Dusty were first by this time, and they quickly led the way down the narrow stairway while Miss Ridley dashed into 6B, where a bewildered substitute teacher was commanding the frightened children to sit still in their seats. While she was marshalling the pupils out things were going very badly on the first floor.

The regular leaders of the first grade line were absent, and then somebody fell and broke the whole line. Consequently, in spite of the calm little first-grade teacher's best efforts to get the little people out quickly, there was a delay of several minutes, which seemed endless to the children of 6A and 6B, who were waiting on the stairway. Miss Ridley glanced through the upper dressing-rooms to make sure that there were no loiterers, as she did not realize how badly she was needed on the narrow stairway where Susie and Dusty stood like statues on the lowest step.

Susie threw back her head a little. She was sure she smelled something burning. She looked over at Dusty, who also wore a queer expression. A little gray puff of smoke came up from the basement stairs. Adelaide Spinney's eyes grew big with fright, and she gave Susie a push.

The other children behind her screamed too, and the whole line pushed against Susie and Dusty.

"Stay back, stay back!" called Dusty, who was the kind of fellow who never loses his head. "You'll trample the first-graders." Then he turned to Susie: "Hold on to the banisters with all your might."

Susie was cool, too. She exerted every bit of her strength to keep the line from sweeping her along. Her hands were bruised and swollen, but she clung desperately to the big newel-post. She shut her eyes and closed her mouth tightly, and held on, although it seemed as if she must give way.

Then she heard Miss Ridley's silver voice. "Pass, Susie and Sterling."

Out they passed and all the rest of 6A and 6B, for the frightened wee folks had gone at last.

Somewhat to the secret disappointment of a few of the boys, it wasn't a real fire after all. The tiny blaze among some waste papers was extinguished without the aid of firemen, and the little gray curls of smoke vanished as quickly as they had appeared. The children stood quietly about the playground, waiting for further instructions, while the white-faced first-grade teacher, Miss Ridley, and the principal, Mr. Corwin, talked together. Then the bell clanged again, a series of short, quick strokes, and the boys and girls formed in line ready to pass again into the school-house.

When the children were perfectly quiet, Mr. Corwin held up a little silver cup. "You all know what this is, boys and girls. The names of the pupils who have helped the school the most are engraved on this. Here is the name of the boy who won the prize essay last year, and here is the girl's name who had the best garden in the city, and so on. I will not take the time to read the list of these children who have done something for their school. We have two new names to add for their brave conduct of this morning, Susie Ward and Sterling Gray. If they had not held their lines back the smaller children would have been badly hurt."

There was a good deal of clapping, and then Mr. Corwin continued, "School is dismissed for the rest of the morning."

The first-grade teacher hurried up to Susie and put her arms around her. "You dear child," she said as she kissed her.

"I'm glad I'm fat now," confessed Susie. "If I had been little like Adelaide I couldn't have done it."

"You're a roly-poly, as your mother was," smiled the first-grade teacher.

"But mother isn't fat," objected Susie, stoutly; "she's straight and slender and lovely."

The first-grade teacher took the little bruised, swollen hands tenderly in hers. "And Susie will look just like mother by and by."

Susie smiled, a cheerful, comfortable little smile, which shone out in her cheeks and eyes. "I'm glad I'm fat now," she announced, "and I'm glad I shall be slender some day."

And she raced home to tell her mother about it.—Mary Davis, in the Springfield Republican.

TREATMENT OF SIMPLE INJURIES.

Splinters.—To remove a splinter, take an ordinary penknife blade first made surgically clean by boiling in water or made antiseptic by immersing in alcohol and passing several times through a flame; slip the point of it under the splinter, hold splinter against the blade with the thump nail and draw it out.

Insect Bites and Stings.—The sting of a bee, wasp or hornet is usually left in the wound and should be removed if it can be found. Then apply hartshorn, baking-soda solution or salt water. Such solutions also will relieve mosquito bites.

Sprains.—Sprains are not such slight injuries as often imagined. The most important thing is absolute rest, with as little handling as possible. Wrap the injured part in a folded towel and apply hot water continuously for one-half hour, then bandage tightly.

FIGURES GIVEN ARE INDEPENDENT AND RELIABLE

Pacific Rural Press Market Report

PRICES QUOTED AS PAID TO PRODUCERS.

San Francisco, March 15, 1916.

WHEAT.

Wheat values here show no further change. A freer movement at Eastern rail terminals has caused a little firmer feeling in some markets, but has no appreciable effect in this district, while trading is limited to local requirements.

Cal. Club, ctl	$1.65@1.70
Northern Bluestem	1.85@1.90
Northern Red	1.85@1.95

BARLEY.

Fear of an embargo on importations to England is having a rather disquieting tendency on the future markets, and trading is quiet, though the spot situation gives no ground for anxiety, offerings being moderate and steadily held. Feed has been marked up a little.

Shipping, ctl	$1.40 @1.42½
Choice Feed, ctl	1.35 @1.37½

OATS.

There is no change in this grain, business locally being of small proportions. Good white oats are firm, other grades being only fairly steady with ample supplies.

Red Feed	$1.35@1.37½
Red Seed	1.45@1.65
White	1.50@1.55
Egyptian	1.50@1.55

CORN.

Kaffir has been marked down a little. Good lots of Milo and Egyptian are steady as quoted, but there is plenty of inferior stuff coming in, for which prices are low and irregular.

Eastern Yellow, ctl	$1.80@1.85
Milo Maize	1.40@1.45
Kaffir	1.60@1.65
Egyptian	1.50@1.55

BEANS.

The bean market is decidedly uninteresting. Only one change is noted this week, and that is a drop on blackeyes. There have been various reports of a reviving movement to the East, but local dealers report business very quiet in practically all varieties. A larger demand is expected to start in at any time, however, and would no doubt strengthen prices materially.

(On wharf, San Francisco.)

Bayos, per ctl	$4.60@4.70
Blackeyes	3.20@3.30
Cranberry Beans	4.75@4.85
Horse Beans	3.25@3.50
Small Whites (south)	5.60@5.70
Large Whites	5.75@5.90
Pinks	4.30@4.40
Limas (south)	4.30@4.40
Red Kidney	6.50@6.75
Mexican Reds	4.50@4.65
Tepary Beans	4.00

SEEDS.

The leading dealers are quoting alalfa higher, as good seed is getting scarce, and there has been considerable inquiry. Some other lines have also been marked up a little, though there is little activity in most of the descriptions quoted.

Melilotus Alba	23 c
Melilotus Indica	6 c
Bur Clover	11 c
Oregon Vetch	5 c
Soy Beans	6 c
Canada Peas	5¼ @ 6 c
Alfalfa, per lb.	22 @24 c
Sudan Grass	40 c

HAY.

The large arrivals for several weeks stocked up the local market rather heavily, and as a result the market has been heavy, with offerings moving slowly. This effect has been the more pronounced as the demand is not very active here, and outside requirements also have diminished rapidly, as many districts are now able to rely on green feed. Prices, however, are well maintained, and for the last week arrivals have been much lighter. There is little movement to the north and south, and some, but not much, for export. Alfalfa is in ample supply, with expectations of an early first cutting.

No. 1 Wheat	$13.00@16.50
No. 2	12.00@14.50
Tame Oats	12.00@18.00
Wild Oats	12.00@14.00
Alfalfa	15.00@18.00
Stock Hay	10.00@12.00
Straw, per bale	25@ .40

FEEDSTUFFS.

All values stand as before. Supplies in some lines are rather light, keeping prices firm, but the demand is considerably lighter than it has been.

(Wholesale prices per ton, carload lots, San Francisco.)

Beet pulp, per ton	$22.50@23.50
Alfalfa Meal, per ton	20.00@21.00
Alfalfa Molasses Meal per ton	21.00@22.00
Bran, per ton	26.50@27.50
Oil Cake	Nominal
Cocoanut Cake or Meal	23.00@25.00
Cracked Corn	39.50@40.50
Middlings	33.00@34.00
Rolled Barley	29.00@30.00
Tankage	45.00
Rolled Oats	29.50@31.00

DRIED FRUIT MARKET SITUATION.

THE situation on prunes and peaches is still too uncertain to offer any inducements either to buyers or sellers to take any immediate action, either on spot or future fruits. The Prune and Apricot Growers' Information Bureau, in a circular just issued, advises growers to sell no prunes at present prices; that the embargo will help the market if growers stand firm, as it will mean the shipment to England as soon as possible of all stocks already bought for that market. This is expected to leave domestic markets very lightly supplied, present New York stocks being far below last year. Private advices have been received from San Jose, reporting some sales last week at 3¾c, but a subsequent stiffening to 4c or over. Our former quotations still stand. A leading local packer says: "We are all up in the air, and the cooler everybody keeps, the better it will be for both growers and packers." While it may be impossible to get the prices received earlier in the season, the effect of efforts to force the market, either on spot or future fruit, would be disastrous.

VEGETABLES.

Nearly everything on the list is easier, as offerings from nearby points have been coming in quite freely, and goods shipped from a distance find but a limited sale. Sprouts are about gone, while artichokes are easier. String beans, peppers, and eggplant from Florida are much weaker; while Mexican tomatoes find a good demand. Peas are offered freely and are rapidly declining. Receipts of rhubarb have been excessive and it is much lower, with little stock bringing the top figure. Supplies of asparagus also have increased greatly and while the Eastern shipments are heavy, local prices are easy. Over 2,600 boxes came in Tuesday. Lettuce is also lower, while celery remains pretty steady.

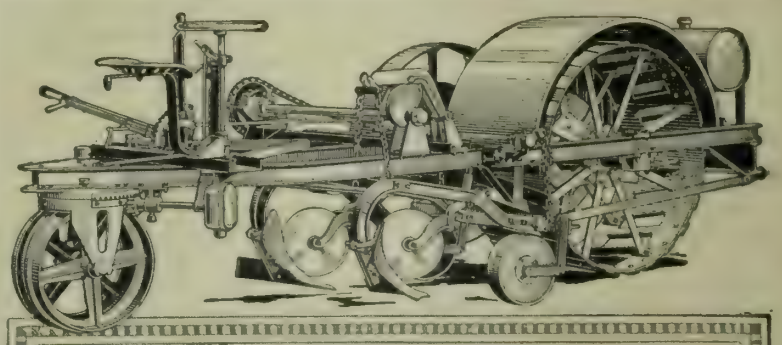
Cabbage, ctl	50@60 c
Cauliflower, doz	50@60 c
String Beans	10@20 c
Peppers, bell, lb	15@20 c
Rhubarb, box, Bay	1.00@1.[illegible]
Peas	6@10 c
Tomatoes, Mex., box	2.00@3.00
Eggplant, lb	15@20 c
Celery, crate	3.00@3.50
Artichokes, doz	20@50 c
Lettuce, small, crate	.75@1.00
Asparagus, lb	5@ 7 c

POTATOES AND ONIONS.

Values in this line show very little change, as the market is still relying on old stock, much of it brought from a distance. A large lot of River onions that had been held for an advance have been dumped, as there has been enough outside stock to meet requirements. Some good-sized shipments of potatoes have lately been coming from Stockton.

Oregon Burbanks	$1.75@2.00
Salinas Burbanks	2.10@2.25
Delta Burbanks	1.10@1.50
Sweet Potatoes, ctl	2.30@2.50

Special Live Stock Market Report.



Hogs are the outstanding feature in this market, prices having again been marked up in sympathy with the general high level in all of the Eastern markets. The highest general average price of hogs since May, 1910, was made at Chicago, March 9, and provisions were also higher. Locally, packers do not expect a much higher quotation than at present prevails and while there are some lightweights slipped through, the high quotations are encouraging feeders to hold in the feed-lots for more weight.

The cattle market is steady at last week's quotations, light cattle still being in strong demand and the bulk of all supplies coming from Nevada and California feed-lots Quite a few grass cattle are expected by the middle of April as feed is in fine condition. A good many yearlings and some heavy cattle that did not feed out good in Nevada feed-lots have been received in California lately for range feeding.

Spring lambs in sufficient quantities to warrant quotations will be on the market by the end of this week. There have been occasional cars received for the past two weeks but no genral trade has been possible. There are still rumors of Eastern buyers in this field, but no one seems to know who they are or what they have bought. The mutton situation remains unchanged.

WOOL

Compared with the recent activity, the wool situation may be said to be decidedly quiet. Prices are not materially different than those of last week and there is very little country buying reported. There is a trifle better feeling in foreign markets which may, or may not be felt here later. There has been a sort of a lull in the Eastern market and buying is not at all brisk, with prices in the buyer's favor.

$750
Cash F.O.B. La Porte
Complete With Plows

And here's what you get—a tractor especially designed for the small farm—tractor and plows combined in one machine—control of entire outfit from operator's seat—an all purpose machine, as good for belt work as on the draw-bar.

The Rumely will plow your truck patch as well as your hundred acre field. It prepares your ground, pulls your binder, does your hauling and belt work.

Our catalog explains the ease of control, the steel gears *all encased and running in oil,* roller bearings throughout, heavy-duty four cylinder engine and rigid frame construction.

DRIED FRUITS.

The New York Journal of Commerce says:

"California prunes are softer, due to the influence of the British embargo orders, which make buyers wary of securing additional stocks at the present time. This is the first trace of an easier tendency which has been noticed since the rulings were announced and local operators are inclined to discount rumors of any further slump from this cause, believing that the present movement is only temporary and that prices will recover within a short time to the level which was being very firmly held before the embargo orders were passed.

"Quotations are said to have been made by Coast packers at a 4c bulk basis f. o. b. common Coast shipping points for stocks of forties to sixties Santa Clara 1915 crop prunes.

"Future prices also slumped, though the immediate effect of the British ruling was felt at the beginning of the week, when buyers ceased purchasing almost entirely any 1916 pack California prunes.

"Owing to the very small stocks of peaches and apricots of the 1915 crop that are left on the Coast there has been no effect made by the ruling on these stocks. Prices are held with a very firm tendency."

The figures below, though largely nominal, are believed to be a fair approximation to real values.

CITRUS FRUITS.

The eastern auction prices show better than for several weeks, caused by the cleaning out of surplus and poor oranges and the receipt of better grades. From now on the fruit will move in a steady stream to the east, mostly in iced cars and should arrive in good condition and command higher prices, especially as the most of the Florida fruit has been shipped. At the New York auction on Monday, Mch. 13, navels averaged from $1.55 to $3.10 per box, and lemons brought from $1.55 to $2.85. At Chicago the same day, navels averaged from $2.25 to $3.00, and lemons $2.25 to $3 per box.

Liberal shipments of oranges arrived in San Francisco about the end of last week, and while values are pretty firmly held locally, there has so far been no advance, the demand being rather quiet.

(Wholesale prices, San Francisco.)

Have you ever seen a little tug boat handling a big liner? Nosing in and out of places where the big clumsy liners are unable to enter—turning in its own length—the powerful engines, capable of handling the biggest loads—compact—no waste room—reliable—working day in and day out.

And now the Yuba—small and compact—yet with ample power to handle the biggest loads—getting in close to the trees—turning up one row and down another without lifting the plow—unaffected by weather conditions—working in any kind of soil.

If you want a tractor that will do big work at a low cost—one built with the same care as a tug, one that is as efficient and economical an aid to the farmer as the tug boat is to the liner—then investigate the Yuba.

Growing Chicks are always hungry—they will eat anything and take on fat very fast; therefore they must be fed properly, or they will become too heavy for their legs and be troubled with indigestion. This retards their growth and they will neither be good layers nor good breeders.

If you want profitable chickens you must, when the birds are five weeks old, feed to produce muscle and thus bring about a good and healthy growth.

SPERRY SUREGROW

is the one feed that is always sure to produce a thrifty growth—a growth that makes a long way towards future profits. It is a properly balanced ration that gives the growing chicks just what they need to develop properly and become good layers and good breeders. Feed **SUREGROW** and you will avoid many chick troubles and materially increase your poultry profits. In recognition of its superior merit **SPERRY SUREGROW** was awarded the **GOLD MEDAL** at the Panama-Pacific Exposition.

FISK TIRES

WITH FISK SERVICE

FISK Tires for seventeen years have maintained a well-deserved reputation for quality.

During that period the Fisk Plant has grown from 27,000 square feet to 29 acres of floor space, and is today the biggest factory in the country for the exclusive manufacture of pneumatic tires.

In all kinds of weather—whenever a car can be used—the strong traction tread of the Fisk Non-Skid tire gives protection against skidding and side slipping, and makes possible the quick stop in time of emergency.

Better Than Ever—and Less Expensive

Long noted for quality, this tire is better than ever before, and yet in price it is less expensive to buy than any other tire equally strong and effectual in non-skid safety and actual mileage results.

The Fisk Branch Organization is the most widespread and complete of any tire company in the United States. In more than 100 cities there are direct Fisk Branches where all tire service (aside from actual repairs) is rendered, absolutely free, whether you use the Fisk tire or some other make. The well developed Fisk policy and spirit of real service is reflected in the attention made possible for Fisk dealers to give you.

You are cordially invited to call and get acquainted at any Fisk Branch. Let them serve you regardless of what tire you use.

California Should Get More from Soil.

Sixth of a series of sketches in which the Editor presents suggestions drawn from long experience, of what Californians should think and do for the advancement of California Agriculture.

JUST now the attention of Californians is chiefly directed toward "getting more from the soil" through rational application of the science of economics and the arts of commerce and finance. If by co-operation and State assistance, to which the State's greatest industry is surely entitled, producers can get their fair share of what a product ultimately sells for, it will be a straightforward and legitimate way to "get more from the soil." To some of our readers this seems the most important thing of all, and they are inclined to hold that if the State will firmly press this button, they will do the rest and be content.

But there is more in economics than the art of selling—there is the operation of production, and those who are accustomed to look very intently upon half an object, until it seems to be the whole of it, are apt to hold that if they are helped to produce more cheaply, they will ask nothing more. This was the attitude of the grain-growers two or three decades ago, and when they secured implements and machines by which they could plow, seed and harrow a strip as wide as a country road in one operation, and cut, thresh and sack the same width in another operation, they certainly did reduce the cost of production to a minimum and were thereby enabled to stay in the business, even through low prices and with less crop than was harvested when the land was new. They did succeed in getting "more from the soil" than they could have done if the cost of production had not been cut in half. And the same would be true if we could reduce the cost of production by reducing the wages of the money which is employed to capitalize the operation of production. Rendering money available at low interest for rural credit, will not only open a wider range of production to many farmers but will lower the cost of production.

Adequate power deepens, broadens and cheapens tillage.

Harvesting a strip wide as a country road in one operation.

But though selling fairly and producing cheaply, either by better agencies or lower interest rates, have such important relations to "getting more from the soil," the real, fundamental thing in making all farming more profitable and all farmers more prosperous, because they can never reach their highest efficiency in wealth-making, until they are employed in connection with something else, which is itself the foundation upon which they can do their best work. They are the methods of success; they are neither the materials nor the motive power of that success. What then is this fundamental, determining factor upon which all the improved agricultural economics and trade must rely to achieve greater success?

Looking Backward.—During the last two or three decades there has been a quite widely accepted popular impression that California soils were getting old, weary and worn and therefore could not reward present farmers as they did the pioneers. Though there doubtless have been individual experiences with particular fields which seemed to justify that conclusion, it is more than probable that cropdwindling of that sort has often been more the fault of the farmer than of the field. There have always been, of course, cases of new land broken from a long process of natural enrichment, by growth and decay of wild plants, by natural tillage, by burrowing animals and by pasturage of wild game, etc., which have rewarded the first cultivator with plants of almost incredible growth and productivity, when there happened to be ample moisture to make this natural richness of soil available to them. But it is quite common experience that once in a while, when everything is favorable, such fields do even now return almost to their traditional standards—but of that we may speak later.

The Record of Average Acre-Yields. — To listen to common conversation one might conclude that half a century ago production of California grain fields, for example, was several times as great as now. It is vain to try to prove that by records covering any large acreage, because such records force one to opposite conclusions. To get a very significant generalization let us go back to a record made at a time when Californians were trying to prove that they had a good agricultural state. In a most carefully prepared address delivered at the Stockton fair on Aug. 7, 1861, John N. Anderson said: "Calaveras county reports an average of 35 bushels of wheat to the acre, yet the average of the San Joaquin district is but 15.4 bushels to the acre. Nevertheless in the year 1850 Massachusetts alone equalled that average and excelled it by but six-tenths of a bushel. Pennsylvania and Texas harvested 15; Wisconsin 14; Maryland 13; Indiana, Ohio and New York 12; Illinois and Delaware 11; Michigan 10; Kentucky 8; Tennessee and Virginia 7—less than one-half our yield, and yet these are emphatically the wheat states of this hemisphere. California is able to rival the greater states, able to exceed most of them in the quantity, quality and size of common products; able to outstrip all of them, save Massachusetts, in the average of wheat per acre."

Surely claiming victory over the wheat states of 1850 on the basis of an average of 15.4 bushels per acre does not sustain our

Los Angeles	.52	19.51	13.13	78	48
San Diego	.46	12.43	8.39	72	52

THE WEEK

MARCH is making a fine record in most places. It has brought weather most opportune for the overcoming of conditions produced by the almost too abundant and continuous rainfall of the earlier months of the season, and brought them soon enough for the plowing-in of the lush winter greenery for the good of the trees or vines, or for the nourishment of field crops which must be planted after frost on lands which are now being turned and worked down for moisture conservation. It is true of course that the winter was a hard one: some spraying had to be passed; some belated pruning threw other work behind, and some spring plowing will be later than desirable. It is unfortunate also that a considerable area of low land has lost its cost of work and winter seeding through unexpected submergence, but much of this will probably be recovered by turning the unusual moisture into summer crops. After all these vicissitudes of "farmer's luck," however, March is apparently doing its best, and with occasional showers and cloudy skies and absence of acute drying winds, the spring is atoning for the freaks of winter and will minister to a large aggregate seasonal production from crops and pasture, and give to all the activities of the State a very good year.

OUR DRIED FRUITS ABROAD.

OF COURSE the shadow which the British government has thrown on our preserved fruit outlook is the darkest thing on our horizon just now—darker than a sunspot and probably much more significant. It is of too recent appearance to make out definitely its area and influence, and, as we stated last week, everyone's duty is to look at it coolly and not to be scared overmuch. Perhaps, if one familiarizes himself at once with what is probably the worst of it, he will be best fitted to illuminate that somewhat with his own courage and optimism. What seems to be the worst of it is sketched by Albert Castle, president of the Dried Fruit Association of California (a dealers' organization). Mr. Castle shows that not until October 30 will it be decided what part of the English purchases of the 1915 crop will be admitted to British ports; that 50 per cent of such purchases is mentioned, and that Secretary Lansing is endeavoring to get 75 per cent or more of them. Nothing is said, so far as we discover, of the crop of 1916—that may depend upon how hungry the British get by that time. Concerning the recent movement of our fruits abroad, Mr. Castle says:

Aside from the English markets, we have hitherto exported largely to France, Holland, Norway, Sweden and Denmark, and prior to the war Germany was our best market. Since the outbreak of the war no direct shipments have been made to Germany, and shipments to the other countries named have decreased materially of late, due to the scarcity of ships and the very high freight rates ruling at present from Atlantic ports—through the addition of about eight times the amount of freight which ruled prior to war times. Aside from this, many customers in neutral countries fear to buy our fruits, owing to the long delays in transit, due to congestion at New York and the strong probability of their consignments being seized in transit by the English authorities as intended for the enemy.

Mr. Castle presents this as a sketch of current conditions and dependent entirely upon the continuance of the war, we presume. If the war should soon collapse, as seems to us likely, it might not take ship owners long to seek charters for prunes instead of bombshells, and they surely would set much better in the European interior. This, too, would set free ships to sail through the canal, in which Mr. Castle does not now see much hope, because there are no idle ships.

OUR DRIED FRUITS AT HOME.

IF, THEN, our dried fruits have to meet British exclusion and would be handicapped by high freights, which would greatly enhance their cost even if the foreign markets were free from exclusion, and as they are handicapped also by the danger of seizure in neutral ships, what is the chance of their sale in this country? Here, again, we had better get used to the worst which can be said of it. This is Mr. Castle's view:

Under normal conditions we export about 40 per cent of our prune crop and 75 to 80 per cent of our apricot crop, as well as a large percentage of our pear crop. We produce in California considerably in excess of what the United States markets consume, so that if we are restricted to business in this country our fruits will naturally sell at extremely low prices, particularly apricots, prunes and pears. Dried peaches have never sold to any large extent in Europe, but the low price ruling on this variety of fruit during the past season has been due to the large crops of peaches produced all over the country, so that in many of the large southern markets no California dried peaches were purchased in 1915 and some buyers in the south still have in stock peaches of the 1914 crop.

This is, of course, a justified commercial view of the situation, which is that as sales have gone so sales are likely to go. It does not include any effect of new forces exerted in popularization or wider distribution than ordinary trade channels carry. Although our merchants and their Eastern connections are probably as strong pushers as their line of trade possesses, they are, of course, not doing the great stunts in exploitation and promotion which are necessary for producers of great specialties to undertake for themselves. For instance, nothing great and systematic has been done to resurrect prunes since the cataclysm of 1900, nothing even for apricots and pears, and the peach is just now beginning to turn in its grave. It has been easier and cheaper for the trade to push the surplus into the open mouth of Europe. They have acted according to their trade precepts and principles, and they have done well, but ordinary trade methods or ideas should never be expected to develop the demand which producers need. You might as well expect the common drug trade to fill the purse of Lydia Pinkham. That estimable woman would never have secured money enough to buy corks and labels if she had waited for the storemen to hand down fly-specked bottles to people who had not been told by wide advertising what kind of pains they ought to find inside of themselves. And so great special food producers have to tell and show people what their appetites ought to crave. This is what the great orange and raisin organizations are spending money for, with wonderful results, and this is what producers of other dried fruits must do. When they do this, with a wise and strong initiative generously endowed, we shall begin to know what cured fruits can be sold in this country. Of the fruits in question, California has a practical monopoly: of prunes 87.5 per cent of the value produced; of the apricots more than that; of the pears and peaches nearly all of the same style and quality. And yet, California has been content to sell to our own hundred million people, roughly, only what could not be more easily shipped abroad. If the British exclusion-act should really wake up our producers to get together and do something in their own behalf, the shock will not be endured in vain.

BUT AFTER ALL, WHAT?

PERHAPS the most important paragraph of Mr. Castle's presidential message on the British submarine prune policy, which we are appreciatively reviewing, is the one he writes at the closing of it. It is this:

In a recent bulletin the members of the new prune and apricot association were advised to take no action regarding the sale of their products until their crops were assured, and it was definitely ascertained to what extent exportation would be possible this year. The committee's advice is sound. While the outlook at present is not encouraging, a change for the better is quite possible at any time.

And of that paragraph, the last sentence is one never to forget. If the war stops soon, as we believe it will, or if diplomacy flops, as it is always doing, the whole situation may change in a day. But it is not wise to wait for that. The proper thing to do is to get so mad as not to give a jam for British appetite, but to organize to make the American people eat up all the choice special products of California.

OUR NEXT GREAT DRIVE.

IT IS probably just as desirable for an agricultural journal to have a plan of campaign and to work definitely towards it, as it is for any other human institution to have such a prearranged plan of action. We have always acted on that conviction, and have had general and special plans which seemed to us to make for the advancement of California agriculture in its various branches. We have not said

much about these plans because it seemed to us they would disclose and commend themselves to attentive readers as they were working out, and we have had abundant reason, in commendation and patronage, to believe that this expectation has been fully realized. Recently, however, some of our contemporaries in the farming-journal line have taken the ground that they ought to be admitted to our initiative, and we have to acknowledge that they might, perhaps, follow us a little closer if they could know in advance what we propose to do. Perhaps if they had known, several years ago, that we intended to use heavy siege guns against the strongholds of unfair finance and unfair marketing in connection with our fruit industries, and thus make culture surer to come through with profits to growers, they might have helped us better to reach these ends. Perhaps if we had, some years ago, told them in advance that we were starting a drive toward the fuller development of the live stock industry and the higher commercial standing of our animal products, they might have made a better show of supporting us in these particulars. Possibly they have done the best they could, and therefore we hesitate over condemnation of their shortcomings. To make sure that we shall not be longer blamable because our contemporaries do not participate in our own initiative for our own work, we do now plainly announce that our next drive will be an effort to set forth the position and condition of general farming in this State and the reasons for its systematic and zealous promotion. We shall endeavor to make clear the relations of general and specialty farming to each other and to the upbuilding of the State, and if we chance to be able to show the folly of undertaking specialty farming in a general way and the wisdom of doing general farming in a specialty way, it may not be so bad a thing to do. Then, of course, we shall have to review the cultural and economic factors of success in general farming and the ways and means which best serve their operation for individual prosperity. This effort will, of course, draw into its service all our resources of regular and volunteer writers who will bring to it special facts and suggestions which their experience and observation warrant. In this way we hope to set forth illuminating knowledge of all field crops which have been undertaken in this State, the reasons for their abandonment or for their endurance in our general farming resources, as the case may be. If we are able to pursue this work as we plan it, the newest Californian among our readers may know even more about California farming than the oldest can remember, and be thus saved from many experiments which can yield only negative results. In the special article on "getting more from the soil," on other pages of this issue, we are merely endeavoring to block in a back-ground for the varied array of landscape features, actions and figures which the finished picture must show forth. For the fundamental requirement of appreciation of how extensive and varied our general farming must become, is the assurance that California is a wonderfully great and fruitful State; that such is the basic fact about it—true half a century ago, true today, and true in days to come—and capable of being employed far more abundantly in the future than in the past by the science and art in its various branches. We have not said of better general farming.

Queries and Replies.

Querists must give name and address.

Burns Up Friends and Foes.

To the Editor: I am sending you a box of "mystery." Kindly tell me what the bugs are. I found a "million by actual count" on a little pear tree and on the alfalfa under it. Not knowing what they were I put oil on them and burned them. They don't look good to me.—Subscriber of the Press forever, Santa Clara.

Well, you have done it. The box contains a few score of plant lice which ought to be burned up and a few striped ladybirds (paranaemia vittigera) which ought to be saved because they are dining on the lice, as is their custom. These striped ladybirds are apt to be condemned, for one may carelessly mistake them for striped diabrotica or squash beetles. Such a mistake always makes these good insects blush and by looking for the pink tinge you can distinguish them from the others, which are too bad to blush. You have burned up both friends and foes alike.

What Are Lentils?

To the Editor: What are lentils and what kind of soil is best adapted to grow them.—M. L., Santa Rosa.

Lentils can be grown on any garden soil, to be planted and grown as peas are. They are small flattish peas growing two in a pod, which is the chief difference between lentils and common peas: the latter coming more than two in a pod, but the latter are round, not flattish and have a horn-like projection. They, too, are farther away from peas than the lentils are in style of growth and belong to the vetch group. Lentils are not used in the same way as garden peas, but are used in soups and stews, as split-peas generally are. Although lentils are one of the leading foods of the human race and have been known since Esau sold his birthright for pottage made of them, they are not much used in the United States.

Caprification or Grafting.

To the Editor: What shall I do for fig trees that never mature their fruit, which falls off when about the size of a quail egg? The trees are healthy and other kinds of figs do well. These trees are about 20 years old. I do not know the name of the kind of fig they are. Please tell me what these trees need and where I can get the material necessary to cause them to mature their fruit.—T. L. W., Dunnigan.

It is likely that they are Smyrna figs and need caprification. If you wish to test it, probably G. P. Rixford, 1813 Pierce St., San Francisco, will send you loaded caprifigs at the proper time to put in your tree and see if the blastophaga will make your figs stay on and ripen. If they do, you should grow a capri tree and do your own blastophagging. If you have not trees enough or interest enough to pursue this line of cure, top-graft the trees to some variety which you find prolific and profitable.

Underground Pests.

To the Editor: Please kindly give me information how to kill the slug eating carrot roots from two inches under the ground, where I plowed in bean straw last year.—A. T. I., Clarksburg.

We never heard of a subterranean slug and would guess that you have to do with a wireworm or some other beetle larva. Whatever it may be, underground fighting is largely impracticable. If the ground is sufficiently porous you can kill such creatures by injecting into the soil carbon bisulphid, but it would cost a great deal more than a carrot or other field crop is worth. You can clean the ground by summer fallowing or you can grow a fibrous-rooted crop, like grain, which would not receive a body-blow as a tap-rooted plant does.

When to Plow Hillside Orchard.

To the Editor: We have about sixty inches of rainfall every season, the land is sloping and the rain often comes in torrents. I have had a dispute as to whether I ought to plow my orchard in the winter time. My practice has been to let grass or some cover crop grow until April and May and then plow, right after what I think is the last rain. I don't plow in the winter because I want to avoid having the loose soil washed away. Our soil absorbs water easily, for my well fills eight or ten feet every time we have a protracted storm and none of the water goes in at the top. Do you think it would be best to plow in the winter time?—Reader, Paradise.

There are hillsides which should not be plowed until the heavy rains are over, but we do not know of any case in which one should wait until all the rains are over. We should say that your date is a month or six weeks too late for plowing to get the land into good summer shape. But this is a theoretical view. The real test of your method is the appearance of your trees and the value of the fruit they bear (if they are of bearing age). If they are young trees their appearance will indicate whether your practice is good or not. If they are thin and stunted the probability is that you plow too late and do not get the right kind of summer cultivation to retain the moisture.

What Is "Deep" and "Shallow" in Plowing?

To the Editor: I am trying to get a definition of shallow plowing and deep plowing. Has some recognized authority defined these terms? We are getting bids on plowing 240 acres of clayey loam soil, and find the bids run from $2.25 per acre for "shallow" plowing to $3.75 per acre for "deep" plowing. The bidders differ considerably in what is shallow plowing, some stating 5 inches, some 7 inches; similarly deep plowing is defined from 6 to 10 inches. On most engineering questions standards are defined by recognized authorities and these standards are recognized, and I am assuming standards representing shallow plowing and deep plowing have been established, but I have not been able to locate this information.—Reader, San Francisco.

We doubt if you find established or recognized definitions. The terms are not only relative to each other, but to local conditions and traditions, which vary. If a man has been plowing four inches, and hears or reads something about the advantage of deep plowing, he is apt to add two or three inches and consider that deep. If he has been going 6 inches and adds two more, he considers that deep, and so on. The figures you mention are rational as representing current views, and their overlapping is according to the facts in the case in the popular mind. We would say 4 to 6 would be "shallow" and 8 to 12 "deep," allowing the two inches between 6 and 8 for "medium." Practically the lack of definition of these terms is not important. They should not be used in getting bids or in making contracts. You should state exactly what depth of plowing you wish to get in inches and then keep busy measuring the depth on the landside of the furrow to be sure you are really getting it.

Grapes Produce $250 Per Acre.

[By E. H. Erickson, Brawley.]

[Mr. Erickson was a pioneer experimenter with deciduous fruits in the early days of Imperial Valley; and the original trees and vines still thrive close to his home "forty."—Editors.]

I do think this place, Imperial Valley, the most promising in California for early table grapes, provided we plant them on the right soil and give them proper care. Most any variety will do well here; but only a few will be profitable. We do not want to plant any wine grapes; but there is a future for raisins.

The soil must be deep sandy land which is free from alkali, will take water freely, is so porous that roots can go deep, but the land will dry out and not stay wet and soggy. Unless we have that kind, it will be of no use to plant grapes—they will not be a success. This is the reason some vineyards in the Valley do not pay; though much could be done in pruning, cultivating, and irrigation. You never could grow them on hard land or that which contains strong alkali. The vines will grow very luxuriantly, but the grapes will have no shipping quality.

Varieties.—To plant at present we have only two varieties, Thompson Seedless and Spanish Malaga. The Persian varieties are such shy bearers that I think it will not be profitable to plant them, as you cannot make them yield more by pruning and high culture. My observation of them for five years goes to show what the microscope has revealed—that they do not produce enough fruit buds. But the government has some very promising varieties at the Station here, which I believe will be worth millions of dollars to Imperial Valley in the future.

Of the two varieties which we have, Malagas are the best, but they are very sensitive to alkali. Thompson Seedless can stand more alkali. Their time of ripening is not much different if the Malagas have proper care on good sandy land.

Pruning.—The vines should be high enough so no fruit will touch the ground. But if they are too high, it will delay ripening; and the high wind we have in spring will injure the vines. Heat reflection from the sandy land will help to ripen the fruit 8 to 10 days earlier.

They should be pruned the first part of January, as too early pruning would make them dry back too much. They should be pruned with the spurs two or three buds long, and enough spurs left according to the strength of the vine. I try to get the center of the vine open so the sun can get in and give color to the fruit. It should have the golden amber, not the greenish, color.

In this country where the land is so rich, vines have a tendency to make too much top. Just before blooming, all water sprouts, suckers, and growth which would be too thick for the sun to get through and ripen the grapes, should be removed. There should be no summer pruning or topping, as it is not needed here. It would only delay the ripening and increase the foliage.

Irrigation.—The vineyard should be thoroughly irrigated in October and November. Too late irrigation would keep the sap running and also keep the land wet and cold, which would delay the starting of the vines in early spring.

The vineyard should be plowed and worked early, to promote starting of the vines. They should not be irrigated while in blossom but should have enough water before they bloom to carry them past blooming. Then irrigation should be given when the vines need it, after the fruit is set. You can cultivate them then. More cultivation would only promote extra growth and foliage and delay ripening. The soil should be let alone to dry out between each irrigation. If the weeds grow too fast, cut them out with a hoe. In that way we can avoid that big luxuriant growth and foliage. But do not give too little water, so that it will prevent developing the size of the berries and bunches.

After the grapes are picked, the vineyard should be irrigated and cultivated to let the vines grow the balance of the summer, as then we are making our crop for the coming year. If we let the vineyard go dry and grow up to weeds, there will be very little fruit the next year.

Management.—The actual acreage of my vineyard is only four acres, planted in the spring of 1906. The first year, I planted tomatoes and cantaloupes between the vines. In the fall I planted cabbage, and the second spring, cantaloupes again.

The third year after planting (1908) I picked my first grapes. I sold them for $400 cash on the vines. In 1909, I consigned the grapes to a commission house and got $350. In 1910 I sold them for cash, 60 cents per crate and the purchasers packed them. I got $600. In 1911, the first year I shipped in the California Fruit Exchange, I got $2500. I have shipped with them ever since. In 1912, I got $800; in 1913, $1600; in 1914, $1375; and in 1915, $492, a large part of the last crop having been spoiled by linnets. This totals $8117 and averages $250 net per acre for each of the eight years, not counting what I have sold locally, which would be more than it has cost me in taking care of the vineyard.

CARBOLIC WASHES FOR TREES.

To the Editor: How much crude carbolic acid can be mixed with a whitewash spray without injury to the trees? Also, can you mix carbolic acid with crude oil and not have it injure the trees that it is used upon?—H. C. B., Cupertino.

[A carbolated lime wash can be made of quicklime 150 lbs.; carbolic acid 2 gallons; water 200 gallons. You can add carbolic acid to a crude oil or distillate emulsion or to a soap wash at the rate of about one gallon of carbolic acid to 150 gallons of diluted emulsion. Crude oil must be emulsified to be available as a plant spray.—Eds.]

According to James Madison of the California Associated Raisin Co. the embargo on fruits into England will not seriously affect the marketing of California raisins, as they can be easily disposed of in this country anyway.

Alfalfa in Almond Orchard.

[Written for Pacific Rural Press.]

"It is safe to say that I get double the amount of almonds per acre on the two acres in which I have grown alfalfa three years, over the eighteen acres in which I have not grown alfalfa, though the trees in both orchards are of the same age," says A. S. La Sell, vice-president of the California Almond Growers' Exchange. "I get about as much alfalfa as I would in the open."

True, the alfalfa in April last year was knee deep in Mr. La Sell's orchard and also in that of a neighbor nearby. Mr. La Sell cuts this alfalfa the same as he would in an open field and feeds it to dairy stock on the place, returning the manure to the land.

"I would be afraid to leave it in the orchard as some folks do on account of harboring bugs and pests," says Mr. La Sell.

Not the only advantage by this system is the addition of nitrogen from the soil air on account of the leguminous character of the alfalfa, but another advantage is gained by reducing cultivation, according to Mr. La Sell. On the eighteen acres which would be in alfalfa if it could be leased for a term of years, the cultivation is much less than most of his neighbors, but he receives considerably more crops than most of the others average. Two years ago, he harvested ten tons from the eighteen acres, when the general yield was four tons for the same acreage.

The soil is plowed very shallow to a foot from the trees and then hoed lightly around the trees. Where alfalfa is growing, it will not be plowed up for about four years more. The plowing will be very careful and shallow, and the ground will be at once re-seeded if the yields continue so much better than in cultivated orchards.

PEARS IN APPLE COUNTRY.

[Written for Pacific Rural Press.]

Pears are the best fruit on the highlands between Beaumont and Oak Glen, San Bernardino county, according to Mrs. J. G. Fisk, whose husband owns the oldest orchard in all that country. His ranch is at an elevation of 3200 to 3500 feet and is a red gravelly soil of unknown depth.

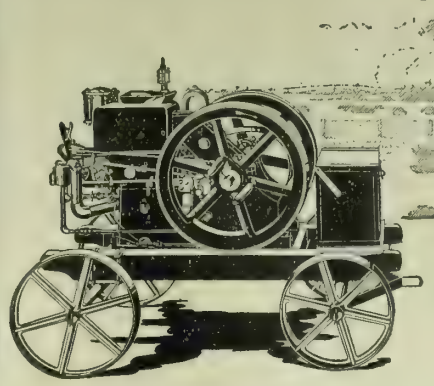
The orchard includes old prunes and apricots which are not a success and are being replaced with Bartlett pears and a few apples. The apples need more water than pears, and plenty of water is not always available. Old cherry trees, Morello and Royal Anne, are doing well and a neighbor is introducing Bings.

Winter Bartletts have borne only twice and are not known yet to be good bearers, but the fruit keeps in ordinary storage into February. We tasted some early last February which were the leavings of what had been kept in the ranch cellar. They were certainly very acceptable.

The summer Bartletts, however, color beautifully, are of fine mountain flavor and keeping quality; the trees have a healthy growth and bear well. Two and a half acres, including a few Flemish beauties, yielded 25 tons, which were sold in 1914, besides the family uses. Hail and wet weather about blooming time lessened the crop in 1915.

FOR CANKER WORMS.

To the Editor: What spray is used for the inch worm that eats the foliage off the apricot and cherry trees? I have used Paris green and arsenate of lead but it does not seem to be much good.—J. B. R., Martinez.



[It is rather hard to kill canker worms after they are at work. Arsenate of lead is best and it must be made pretty strong and well sprayed. Banding the tree two inches wide with tangle-foot will keep the wingless moths from getting up to lay eggs and this is better than spraying if done early in March before they come out of the ground.—Eds.]

TOP DRESS all your Crops with **Nitrate of Soda** alone, no matter what other fertilizers you may have used. 100 pounds to the acre for seeded, and 200 pounds to the acre for cultivated crops will do the work. The increase will yield large profits over the cost.

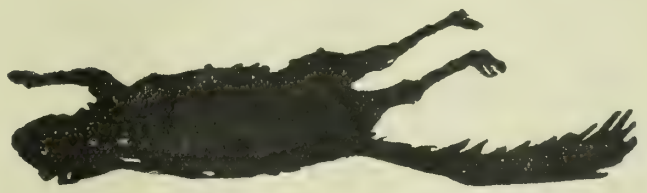
Power for Forty Farms

WON HIGHEST AWARD PANAMA-PACIFIC INTERNATIONAL EXPOSITION

Mogul and Titan Engines

TWENTY **Titan** engines of all sizes, all kerosene burners, were lined up in front of the I H C dealer's store at Litchfield, Minn., one day last summer. That day their new owners took them out to supply good, reliable power on twenty farms. A few months later Litchfield saw twenty more farmers take **Titan** engines out to their farms.

Two big **I H C** engine delivery days in that town last year. In many hundreds of towns you will find this same popularity of **I H C Mogul** and **Titan** engines—the best farm power—Grand Prize winners at San Francisco.



You must have an engine—then buy an **International Harvester** engine—**Mogul** or **Titan.** It will keep down your fuel and repair bills, deliver the most power with least trouble, and save you more hard work than you can realize now.

International Harvester engines are made in all approved styles, sizes from 1 to 50-horse power, operating on low as well as high-grade fuels. Some local dealer near you handles **Mogul** or **Titan** engines. If you don't know him, drop us a line. We'll send you full information, and make it easy for you to get the best farm engine made.

Mulched Basins Help Oranges.

[Written for Pacific Rural Press.]

In the summer of 1912, the Navel orange trees wilted in a hillside block of 8 acres belonging to D. C. Lefferts of Redlands, in spite of the monthly four-day runs of 22 inches of water day and night. They were nearly 25 years old, and in the past 10 years, so far as could be found, had never borne over 4200 field boxes. In 1913 they were badly frozen, but produced 3272 field boxes the following season. A third of the usual amount of water prevented them from wilting and sized the fruit. In the next year, 1914-15, they bore 5395 picked boxes besides 600 injured by bad spraying.

He had always plowed in manure and dry stuff, and one season he subsoiled. In June the soil was beautifully mellow all the way down—in September the soil was bone-dry six inches below the cemented irrigation-sole under the plowed ground. Now, in some neighboring orchards, one cannot pick the ground loose 6 inches below the plowsole, but close under Mr. Lefferts' trees he says he can shove a hoe handle down full length in the ground. Subsoiling in spring is not practiced in that country, largely because it is useless—after the second or third irrigation the ground is cemented as hard as ever and the roots cannot get substance from it. Formerly very little life of any kind could be found in the soil—now it is swarming with bacteria and larger soil organisms.

"Bacteria, angle worms, etc., are the only means of keeping our subsoil open to water so the roots can get down deep," says Mr. Lefferts. "They will do it if we keep the soil constantly, not intermittently, moist, and not too hot. I believe we have been killing the bacteria by summer cultivation."

Mr. Lefferts has provided for moisture and coolness by basining and mulching, but his problem is not entirely solved yet, possibly for lack of the granulating action of lime or gypsum.

In Jan. 1913, he made basins about the trees just large enough to catch the drip from the leaves, and filled them with manure at 2 cents a cubic foot. The first year all the manure disappeared and only ⅓ of the water was needed.

The second year, manure was too expensive, so spoiled alfalfa hay, $300 worth at $8.50 per ton delivered, was used in the basins. Alfalfa was also planted in the three-foot spaces between basins and what little grew up was cut for mulch. The growing alfalfa would be irrigated night times, but the soil baked so that after two years' trial he has plowed up the centers the past fall, leaving the basins intact.

The basins had been enlarged in the winter of 1914-15 except one corner. On this corner last summer, the trees wilted while the basins would still be wet. So last fall Mr. Lefferts dug a trench across the center and to one of the trees.

Where alfalfa had been trying to grow, the ground was somewhat easily dug with a pick. Under the basin from the border to the tree, moist dirt was found as a sort of inverted cone 6 inches deep at the edges and 16 feet beside the tap root, where a rod was shoved ten feet below the bottom of a six-foot hole.

The water had penetrated more easily down beside the big roots. With moisture and coolness the bacteria, according to Mr. Lefferts, prevented cementing around the big roots; but that was not where the most of the tree feeders could get moisture. So this year all basins will be enlarged to the limit. Whether this will prove permanently effective remains to be seen.

The effect of the basining on soil temperatures was strikingly shown in the summer of 1913 when a thermometer bulb was buried 15 inches deep on the sunny side of a tree in the mulched orchard. It stood at 72 degrees in the morning and at 76 degrees at evening. A thermometer in a neighboring cultivated orchard buried similarly showed 68 degrees in the morning and 82 degrees at evening.

HEMET MARKET OWN APRICOTS.

[Written for Pacific Rural Press.]

With all of your marketing, get good customers for all of the produce you expect to sell; and then keep them supplied with standardized uniformly graded goods. This is the practice of the Hemet Cured Fruit Ass'n which, according to its manager, C. G. Hamilton, shipped 450 tons of its total 580-ton dried apricot crop of 1915 to New York. Of this, 75 tons were sold to one firm.

The last 90 tons were shipped to one firm late in February, 1916, at 7 cents for standards, 8 cents for choice, 9 cents for extra choice, and 10 cents for fancy. Of the fancy, they had a large proportion, since these had been held back. The 1915 crop of the Association, which comprises that of 150 members, 90 per cent of all the local growers, sold for close to $80,000.

The local Association withdrew last May from the Cal. Cured Fruit Exchange, partly because the representatives of the local people claim to have found it impossible to inspect the books of the Exchange, or to get definite information as to its operations, partly because of changes in financial arrangements which the State Exchange wished to make, partly because the returns on their shipments were so slow in coming to the local. They have every confidence in the integrity of the State Exchange people, but do not like their new propositions or their secretiveness.

"The foundation of co-operation is confidence," says President E. O. Eggen of the Hemet Association. "When the central organization attempts to run the growers, instead of the growers running the central organization, the growers want to drop out."

The Hemet Cured Fruit Ass'n has not lost a member since its withdrawal, has gained several, has been very successful marketing its crops, gets quick returns and much "fatherly" advice from its New York brokers.

The brokers sell the fruit before it is packed. On receipt of an order at a given price and its confirmation

MR. COATES NOMINATES MR. HECKE.

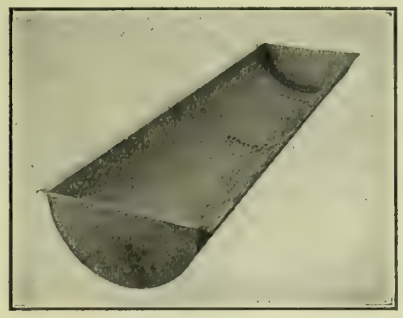
To the Editor: The fruit-growing interests of California are too important to be trifled with, when growers everywhere must endorse the principles laid down in the Rural Press of March 4th. The acts of the San Bernardino convention are so petty as to be hardly worth a second allusion.

The State has long felt the need of a broad-minded and practical Horticultural Executive, one versed in commercial pomology. The office has been too long a chair of economic entomology.

Why not G. H. Hecke? There may be and doubtless are other men as good, but there surely is none better. Mr. Hecke would fill all the requirements; an energetic, successful and up-to-date fruit grower, living in the center of the greatest fruit growing valley; a keen executive, and good business man, and one who knows full well the importance of the enforcement of all laws relating to the control of insect pests and plant diseases.

Mr. Maskew is evidently the right man in the right place; why not keep him there? Our Horticultural Executive must be, first of all, a thoroughly competent commercial fruit grower, and who now has the time to devote to the office.

Morgan Hill. **Leonard Coates.**



[Although we had, as stated in our issue of March 4, and although we still have, no candidate for this office, we are willing to print the statements of reasonable character and length from our readers who take an interest in the very important matter to which we have urged attention.—Eds.]

ARE DRIED PERSIMMONS DESIRABLE?

To the Editor: I notice that some parties are urging the desirability of dried persimmons as a California product. They might find it beneficial to know the exeprience of others with dried persimmons. They have been dried in Japan and China for ages and, as stated, there are "delightful possibilities" in them, but for a brief period only. If of prime stock they are superb when first dried, but they rapidly fall off in quality. Very soon after drying they begin to exude a very disagreeable sugar and presently become thickly coated. This sugar is of a mealy and exceedingly unpleasant character and should be scraped off before eating. Without doubt it can be washed off and wiped dry and made presentable, but even then it will be far below the original quality; the elimination of the sugar having caused a considerable deterioration. Therefore if attempt is made to dry them it must be for a quick market, to be used when fresh only. **W. Stuart Smith.**

More About the Standard Prune.

To the Editor: In your issue of March 4th, J. T. Green gives the Standard prune quite a boost, which to shippers of green prunes for the market seems to hold good. The Standard is a handsome fruit of fine flavor and may ship well, but from a dried prune standpoint this variety will not do in our county.

Apart from the fact that they dry so light and need almost as much care in handling as an Imperial, it has serious disadvantages: (1) The wood resembles the sugar prune in texture. (2) The fruit dries out, when properly cured, about 4 to 1 as compared with 2½ to 1 on the Imperial or French. (3) The fruit has to be picked or batted off the trees as it has such a tenacious hold on the stem.

Thus, the cost of picking up fruit per dried ton would be $16 per ton for Standard as compared with $7 to $7.50 for French or Imperial. For it would cost at least $1 a ton more to pick from the ladder than to gather from the ground—more if the crop were light. (4) I have noticed a thin line of dark meat near the center of the fruit such as one sometimes notices on the side of a dried Imperial if it has been allowed to dry up too much before turning.

As we can turn out such superb fruit using French, Imperials and Robes, why turn to a new and untried variety rather than improve those of known excellence we already possess?

It would be a boon to horticulture if an honorary committee were established, of well-known commercial growers, to try out any new variety of tree or plant before it is thrust onto the market. There are always a number of enthusiasts—and generally men who can the least afford it—who are carried away by the glowing accounts of new products and put their all into its production only to learn years later that a mistake has been made.

In our own county, many hundreds of acres of Picholine olives were set our many years ago, on account of the high oil test, it is said. Scores of remnants of these heart-breaking and ill-advised efforts remain today, monuments of weary years of unprofitable labor. The spineless cactus may be all right in some locations. Our own rich bottoms return such handsome dividends when properly managed that we have been able to steer clear of this uninteresting and unprofitable child of the desert. Its pitiful little efforts here and there throughout the county, with good, rich alfalfa growing on adjacent ground, are object lessons.

Napa. **John J. Fox.**
Horticultural Commissioner.

STATE-WIDE INFORMATION ABOUT MARKETING.

To the Editor: The following suggestion was read before the Santa Clara county Pomona Grange March 11, discussed, and a resolution passed requesting me to publish same. I hope, therefore, that you will find space for it in the Pacific Rural Press and also that you will give your readers the benefit of your views on this big and vitally important subject:

"The local information bureau which we have now is good so far as it goes, but it doesn't have access to all sources of information in the East and in Europe which it should have. What is needed is a bureau under State management and control not only for prunes and apricots but for every kind of production in California. Then small local bureaus should be organized to receive the information for one particular product of that locality. The cost when for all products, would benefit everybody in the State and consequently the slight tax necessary would be more than counterbalanced by the increased profit in selling to advantage, due to the knowledge of the markets gained by this State Information Bureau. The State already has means for gaining information as through consuls and officials of the other States.

Each small local bureau mentioned above should receive the information only for one product, for instance, prunes (not vegetables, etc.), and should in turn collect accurate information as to amount and condition of that crop in that locality. Prunes would probably require several bureaus in this county, as different sections are so different in quality, due to different climatic conditions." **Sivert H. Shelley.**

San Jose.

[It seems to us that such an organized effort for actual facts about all crops is a part of the working machinery of the State Market Director, and that it is neither necessary nor desirable to provide another organization to secure such facts.—Eds.]

At a meeting of the Tulare County Protective Association held at Porterville last week resolutions were adopted binding orange growers, shippers and packers to abide by the 8 to 1 standard with the provision that fruit which does not come up to the 8 to 1 standard by December 10 may be shipped, without certificates, however, if it shows eighty per cent natural color.

THE "BOSS" TREE PROTECTOR

Made of Yucca Palm. Is cheap, durable and quickly put on the tree. It prevents rabbits from destroying your trees. A sure protection against frosts, sunburn, grasshoppers, or dry winds. Can be easily removed, will last for years. Send for samples.

HIGH GRADE CITRUS TREES
Oranges Lemons Grape Fruit

We have spent our entire life growing citrus trees. You cannot buy better citrus trees than we offer you. All trees from stock of 1 and 2 year buds, selected with greatest care, and taken from our own grove. Our nursery is located in a clean district—our trees absolutely free from insect pests, 5-8 and up, guaranteed TRUE-TO-NAME. You cannot beat our prices for quality stock.

HOW TO SEASON EUCALYPTUS.

To the Editor: Could you tell me how to season eucalyptus wood to avoid checking?—M. R. B., Morgan Hill.

[Answered by Carl A. Kipfer, Acting Asst. District Forester, San Francisco.]

[The question is rather indefinite since it does not state the species of eucalyptus or the form in which it is desired to dry or use the wood. The Forest Service has experimented with the drying of blue gum and manna gum in the log, both peeled and unpeeled. The results were not satisfactory. It was, however, determined that checking can be stopped to a very large extent by leaving the bark on and painting the ends with a heavy paint to prevent the rapid escape of moisture. The safest method for drying the lumber consists in piling it in the shade where the circulation of air is not too great. The stickers used should be not more than one inch thick. Even under these conditions thick lumber checks a great deal in seasoning. The operation can be hastened somewhat by drying the partially air-dried material in a kiln in which circulation, humidity and temperature can be controlled.

There are some species which, it is claimed, can be dried very easily and with practically no loss in checking. We have had no experience in handling these and do not know what American-grown wood of these species would do. The trees should be cut in winter.]

MILLET ON SANDY SOIL.

To the Editor: Will millet grow on sandy land here near Kingsburg? Which is the best kind, and the best time to sow?—J. H. P., Kingsburg.

[Answered by Geo. H. Croley.]

[Millet will grow on either sandy or heavy soils and thrives on any land that contains plant food in sufficient quantity to produce any sort of hay or grain. When irrigated it yields heavily as green forage, hay, or seed, frequently producing 40 to 60 bushels of seed to the acre when grown on rich soil. In Europe and Asia it is extensively grown for both hay and seed. There are many varieties that we, in America, class as millet—the kinds that produce a straw similar to wheat, but the millet family embraces hundreds of varying plants including the numerous sorghums, such as Egyptian corn, Kaffir corn, etc. The seeds produced from all sorts of millet constitute the third largest supply of cereals for human food; rice being the greatest, wheat second, and millet products third. The straw millets are not likely to be extensively grown in California because the cane or sorghum varieties are considered more profitable, but there are exceptions. A farmer in Nevada county sowed a red-seed hay millet for several years and reported that it produced, for him, more good feed than any other forage crop he had tried. This red seed is not good for either human food nor for feed for poultry and animals. The soft-skinned white, yellow, or buff sorts should be planted if the seed is intended for feed. To produce a crop of seed use from 10 to 20 pounds of seed to the acre; for a hay crop increase to 30 to 50 pounds. In Fresno county April or May are good months for planting.]

Choice, Healthy
Citrus Trees

Washington Navel and Valencia Orange, Lemon and Grapefruit; two-year-old budded stock. Trees in perfect condition—grown in exposed positions. Best citrus stock scientific culture can produce.

We have three citrus nurseries—Escondido, Anaheim and Los Angeles. If you are near these points we can save you money by shipping direct from nurseries. Special prices on large shipments.

$2 Combination Offer

Four trees—Washington Navel and Valencia Orange, Lemon and Grapefruit, $2. Additional trees, 50 cts. each—single trees, 65 cts. each. All trees carefully balled—perfect condition for planting. Write or ask for Mr. Peck.

PIONEER NURSERY, Dept. R, Monrovia, Calif.

Col. Irish Struck by Submarine

To the Editor: "Farmer" Irish has always been an interesting personality to me since I first heard him speak some 30 years ago in Southeastern Oregon, on the "Political Issues of the Day," which were of course of vital interest to the "common people."

As I remember it, he warmly congratulated the residents of that section as being fortunate in living in such a favored and fertile country. [To jolly the audience is one of the fundamental requirements of the art of oratory.—Eds.]

But after returning to California Col. Irish was reported to have made the remark, in answer to a query in regard to that particular section, that "the soil up there was too poor to sprout white beans without a shower of vinegar." [There are two ways in which this passage may be interpreted. From one point of view it is political retribution, because your sand-lappers up there probably voted for soft money in spite of the enlightenment offered you. From another point of view, Col. Irish was merely prophesying that the accepted treatment for alkali would soon be the application of a dilute acid.—Eds.]

Now it appears that age has not diminished the Colonel's joking ability in the least, as witness his recent statements in the Rural Press, that "we farmers being brethren in distress should tote fair." Then he takes up the defense of the bankers whom he would have us believe are having a struggle for existence on a measly 6 per cent interest, and says he would rather take his chances as a farmer with $25,000 than as a banker.

The Colonel may deny any joking in this matter on his part, but recently compiled statistics, by Massachusetts officials show the average savings of bankers to be $2,588 yearly as compared to $254 for farmers, or ten times as much for the banker.

The Colonel is also certainly joking when he mentions "tax-eaters," for he knew no "sich animal" for years while posing as a "gold democrat" and holding down a soft political berth, the hardest part of which was, according to common report, showing up pay day and drawing down his little old $5,000 per. [As we understand it, Col. Irish did not create this office which he filled so amply. If we remember correctly, it is provided for somewhere in the by-laws of the United States and presumably for the good of the people. But even if that time-honored right of an American, to hold an office if he can get it, may be rendered obsolete by recent changes in the art of war, your attack is still not justified because any kind of a democrat ought to be glad that another democrat (also of any kind) succeeded in bamboozling an enemy administration out of an office which belonged to a republican.—Eds.]

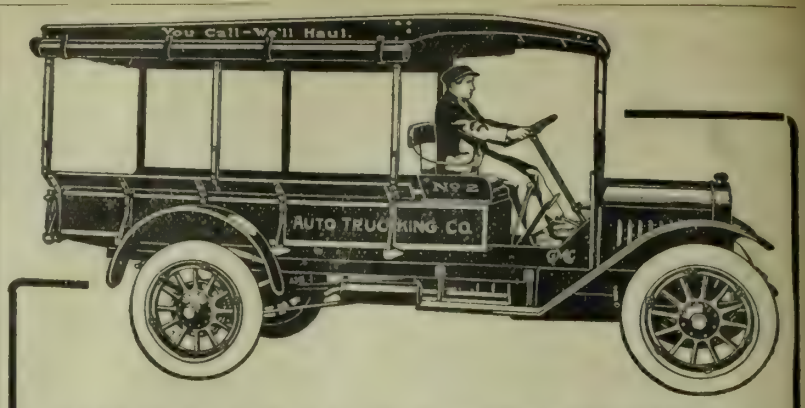
Yea, verily, we farmers are "brethren in distress."

Lone Pine. Charles Probasco.

[We were sure that the banker-farmer paragraph of the Colonel's on page 291 of our issue of March 4 would bring out something hot. If it were not war time we would not permit a stroke below the waterline, and we publish it in this instance for the purpose of interpolating the references to the international law of warfare, for which we shall stand for the maintenance of the sovereign rights and dignity of the American people.

In its more personal phases we are convinced that Col. Irish has lived down the political vagaries of his youth, just as many of the rest of us have, and we can assure our correspondent that Col. Irish is now a prosperous and contented farmer, and we believe he is perfectly honest in his conclusion that he would rather be a farmer than to be a bum banker who did not know how to make more than six per cent.—Eds.]

INSECT PESTS SPREAD BY WIND.



How wind spreads destructive scale insects has been shown by recent investigations of the University of California. The result is a powerful argument against letting orchard or road trees be neglected.

The manner of distribution of scale insects has always been a subject of much discussion in the citrus-growing sections of California. Its important practical bearing is in connection with "block fumigation," that is, fumigation done solidly over as large an area as possible by the advice, and compulsion when necessary, of the county horticultural officers. If one grove is fumigated and the neighboring one is not, some maintain that the untreated grove is an important source for the quick reinfestation of the treated one, while others maintain it is of little consequence.

During the past season the Citrus Experiment Station at Riverside has secured some definite data on the role of wind in the dispersion of scale insects. The young scales were captured on tanglefoot sheets at various distances up to 450 feet, or at a distance equal to twenty tree rows. Several hundred scales were captured on these sheets after two or three days' exposure at distances of 20 or 30 feet or more.

A four-acre block of orange trees, with badly infested trees on three sides, was fumigated in 1914, with practically 100 per cent of the scales killed. In 1915 the scales were spread by the wind over this entire block of clean trees and on the outside rows as many as one hundred scales were found on a single leaf. There were more than three times as many scales on the trees immediately adjoining infested trees as on the next row away, and three times as many scales on the windward side as there were on the leeward side of the trees. The scales, however, spread from the neighboring groves in more or less numbers over this entire four-acre block in a single season through the agency of the wind.

To keep the trees clean under such circumstances it would be necessary to fumigate every year, while if the neighboring groves had been fumigated at the same time, this expense would not have been necessary for three or four years. Pepper and olive trees bordering on citrus groves are also important sources for reinfesting the treated citrus trees.

Which Sorghum for Heavy Moist Lands?

To the Editor: What variety of the non-saccharine sorghums will yield the most grain in the heavy, rich, moist lands of the San Joaquin valley, roughage not considered? Other things being equal, are the dwarf varieties preferred, if they are not to be irrigated?—J. A. W., Merced.

[Answered by Prof. John W. Gilmore, University of California, Berkeley.]

[It is not safe to say positively which variety of the grain sorghums will do best on a given soil; for culture methods, including time of planting and the condition of the soil in respect to its moisture content and physical properties, all have a bearing. There are three varieties, however, that would, in all probability, do well upon the soil mentioned by J. A. W.; these are Dwarf milo Feterita, and Brown or White Durr (Gyp corn). The main reason why these varieties are suggested is that they are of relatively short growing season, consequently make the best use of available moisture. Kaffir also does well on such soils, under circumstances when the moisture supply can be maintained until very late in the season. It should be noted that the Feterita is more particular about the moisture content and the condition of the soil at the time of planting than are the other two varieties mentioned. Late rains such as we had last year are usually detrimental to the germination and early growth of Feterita. On the other hand, Feterita is perhaps, of the three varieties mentioned, least damaged by birds. On the whole, it has been my impression that Dwarf milo is the best all round grain sorghum for the San Joaquin Valley. It lends itself to a wide range at time of planting, puts forth its best efforts to produce a crop even on adverse soil types, and is quite as drouth-resistant as any other varieties.

In planting grain sorghums it would be well if the same variety might be planted in a given community, and especially is this true where home-grown seed is saved for next year's planting. It has been amply demonstrated that home-grown seed when well produced is better than imported seed, but when a number of varieties of this crop are grown in the same community these varieties cross and deteriorate the value of the seed.]

Why shouldn't the Standard Oil Company make the best oil—with over 40 years experience in refining—with unequalled plant equipment? And Zerolene is scientifically refined from selected California crude—*asphalt-base*. Prominent authorities have recently declared that an oil correctly refined from asphalt-base crude can be made not only equal but superior to paraffine-base oils. Next time you empty the crank-case refill with Zerolene. Dealers everywhere and at service stations and agencies of the Standard Oil Company.

APRICOTS INTERPLANTED WITH WALNUTS.

[Written for Pacific Rural Press.]

In Orange county, there has been quite a practice of planting apricots among walnuts.

"How do you like such a system?" we asked of J. Griset, who has 13 or 14 acres of walnuts about 12 years old in which alternate rows are Royal apricots, while within the walnut rows, alternate trees are apricots. The place slopes considerably and the sub-soil is of adobe clay nature.

"The combination is a bad one," said Mr. Griset. "We can't irrigate the walnuts when they need it on account of the apricots. We irrigate the apricots late in May and then not any more until the fruit is off in August, because the fruit would be too mushy to knock off the trees to pick up for drying as we do here.

"But the walnuts need water when their meats are forming late in June, to make them fill out good. We can't get it to them.

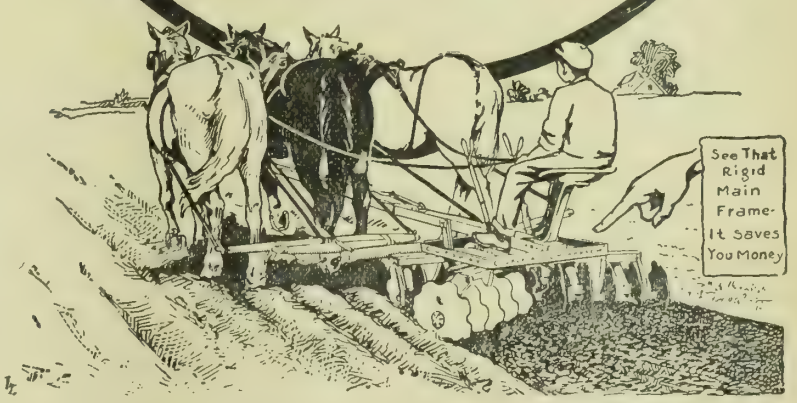
"Year before last we took 18 tons of dried apricots from the place. Last year it yielded 15 tons of apricots but only 1½ tons of walnuts. The low net yield was partly due, however, to having many trees which are naturally poor bearers, and partly because walnuts want deep loamy soil. The apricot roots spread out. I will pull out the walnuts."

Millet is proving to be a good summer crop in Placer county.

Bigger Crops at **Less Cost** from **Better Disking**

All easily possible with the right tool. Bigger crops always follow better disking; and thorough cultivation with one trip over, instead of two, is a worth-while saving in cost. Are *you* using the machine for better disking—that is the CUTAWAY (CLARK) Double Action Disk Harrow—the *original* double action harrow? It's the farmer's greatest time and labor-saver in his most important work.

Disk Before Plowing



as well as after, with a CUTAWAY (CLARK) Double Action Disk Harrow; makes plowing easier, gives better results. Every particle of soil is thoroughly stirred because the rigid frame—a patented feature—forces the rear disks to cut just between the furrows of the fore disks.

Cutaway (CLARK) Double Action Disk Harrows

penetrate deep because of the cutlery steel disks *forged* sharp. The dust-proof, oil-soaked, hardwood bearings and perfect balance make it noted as a light draft implement. If your dealer hasn't the *genuine* CUTAWAY, write us direct. Send today for copy of new free book, "The Soil and Its Tillage."

The Cutaway Harrow Company
7615 Main Street Higganum Conn.

Maker of the original Clark Disk Harrows and Plows

A Word to the Wise, Etc.

We tell them to buy and that seems to be all that is necessary; but the proof of the pudding is in the eating, you know, and the real reason for so many orders at this early season is because of the sturdy construction and simple method of attaching.

California Should Get More From Soil.

(Continued from page 377.)

modern conversational standards of what California soil did in the early days. But let us see rather more definitely how the average acre-yield of wheat has ranged for about sixty years in this State:

Period	Aver. bu. per acre	Aver. acres sown
1855-60	19.73	191,302
1868-70	19.04	931,651
1871-80	13.04	2,093,927
1881-90	12.17	2,795,132
1891-00	12.27	2,701,620
1901-10	13.39	1,521,506
1913	16.50	300,000
1914	17.	400,000

Of a number of deductions which may be drawn from these figures, these seem clear:

First, that when little wheat is grown, obviously the land which yields most profitably is used for wheat and other lands lie idle or give pasturage or are sown with barley and other cereals which are less fastidious than wheat. This largely accounts for the increase in acre-yield since 1900.

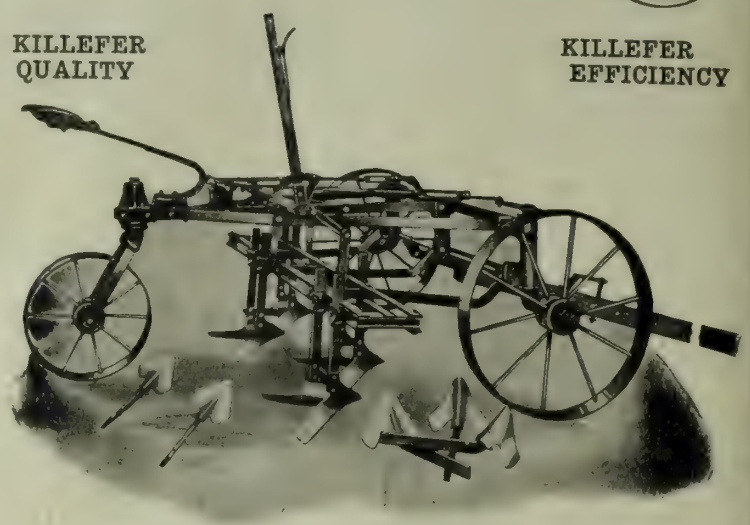
Second, that the best soils for wheat, the deeper loams of the lower valley, lands were available to the pioneers for wheat, but are now largely used for fruit, for alfalfa and other field crops which are counted to yield more money than wheat. Surely much of the land used for wheat from 1855 to 1870 was somewhat better than that used in 1914 and this would partly account for the higher average acre-yield in the earlier years. However the difference in the average yields shows only two to three bushels in favor of antiquity, or a rough percentage of decrease of, say, 12½ per cent.

What, Then, Becomes of the Stories of Antiquity?—Of course as one thinks only of these deadly averages, the impression intrudes that the pioneer Californians were the greatest liars on earth about the large yields, but that impression is itself false and misleading. The old records are true, and it is interesting to note that they are supported by the records of today. Take, for example, this:

In May, 1858, W. H. Drum had a field of Sonora wheat on the right bank of the Yuba river, five miles above its mouth. Ten acres of this field "duly measured by a competent engineer," when threshed yielded 84 bushels and seven pounds per acre. The whole field of one hundred acres, of which the above ten acres was a part, yielded over 80 bushels per acre. On this demonstration Mr. Drum received the first prize for wheat yield in 1858.

Mr. Drum had evidently rich bottom land such as was then proved to be good for wheat, but wheat was making a break for higher lands as is shown by this unique account by the State Agricultural Society's "Visiting Committee" in 1859: "Henry Stowers, in the midst of predictions of failure, half-suppressed sneers and derisive remarks, and not a few misgivings of his own, plowed, sowed, and otherwise protected, but gave no water to, forty-five acres of the most forbidding loose red soil, between Ione City and Jackson, to wheat. His entire field averaged 46 bushels of very fine wheat—thus initiating the culture of another extensive portion of the state considered quite useless after its crop of gold was gathered."

When Did Depreciation Begin?—As we read these figures of great wheat yields, the question naturally arises: When did these reports of the decline in fertility of California soils begin to appear? Of this we cannot be exactly sure, but it will serve present purposes to show that in the annual address at the State Horticultural Fair in San Francisco in October, 1858, Wilson Flint said this: "It is a startling truth that the yield per acre of the cereals all over the once rich valleys of our state is so much on the decrease that, with the immense increase annually of breadth of land put into grain, still the amount produced is not much greater in the aggregate." The fact is, then, that this conclusion about the decline in the production of valley lands is not "the result of half a century of wheat growing" as we now so frequently hear, but was noticed and prominently proclaimed in the year 1858—the same year that Mr. Drum was harvesting wheat at the rate of 84 bushels and seven pounds per acre on the Yuba river bottom and one year before Mr. Stowers harvested 46 bushels of wheat per acre on dry foothill lands of Amador county, which were supposed to be only good for gold-washing. It is also interesting to remember that this report of decline in wheat yield was made before the State began shipping wheat abroad (which was in 1859) and seven years before General Bidwell, at the State Fair in 1865, said: "It would be a poor farm, and poorly cultivated at that, if it failed to yield 25 bushels of wheat per acre, and 50 bushels per acre is no uncommon crop."



It is clear enough that the decrease in soil fertility is not a new idea in California. We shall have occasion to refer to Mr. Flint's declaration again in another connection.

Can We Now Approach the Old Extremes?—We have to admit that the record made by Mr. Drum in 1858 stands in a class by itself, so far as any recent approach to it, of which we now have the figures, is concerned. Perhaps some reader can match it for us, with facts now known to him, and we would like to hear of it. But Mr. Drum made 84 bushels when the state average was 19.73 bushels, and we shall now give figures for 51 bushels when the average is 17—a difference the same in kind but less in degree, and obtained on plains land and not in the river bottom, which may count for considerable of the difference. However that may be, the report of the director of the University experiment station for 1914-15 shows that during the grain year of 1914 "at the University Farm at Davis, with a system of biennial cropping and without irrigation, Cumberland wheat (51.6 bushels per acre), red Algeria oats (100.6 bushels) and improved common barley (76.8 bushels), gave the highest yields. There were 63 varieties of wheat grown, averaging 28.8 bushels; 18 varieties of oats, averaging 61.4; 36 varieties of barley, averaging 52 bushels. The rain-

Beet Cultivator (K)

KILLEFER QUALITY

KILLEFER EFFICIENCY

The frame of this Cultivator is made of one continuous piece of high carbon steel with a truss connecting it to the main castings, supporting the two steering wheels. This construction makes a cultivator that is almost impossible to break down in the center and in consequence the wheels are always in line and under easy control.

The lower frame or tooth bar is from the same quality of steel with a strong arm at each end, which connnects with the lifting rod, allowing no chance for the frame to dip or run deeper at the ends. The seat is set back far enough to give an unobstructed view of the rows. The foot control of the front wheels is adjustable with a turn-buckle for taking up wear, and is very easy on the operator. A lock is provided for the rear wheel that holds it rigidly in line except on the turns. This is the **strongest** and **best made** Beet Cultivator for sale on the Pacific Coast.

The Killefer Manufacturing Co.

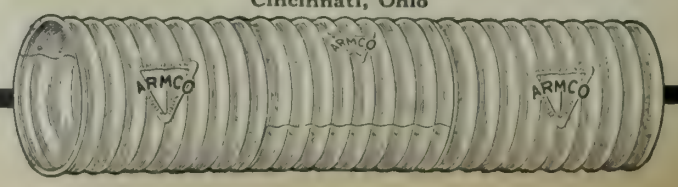
That Bridge Must Go!

The "Safety First" idea rules the country today. The public is demanding that the highways be made as safe as the railroads and traction lines. Wooden bridges must give way to



"ARMCO" IRON CORRUGATED CULVERTS

These culverts are not only absolutely safe but moderate in first cost, inexpensive of installation and entirely free from up-keep costs. The fact that they are made of "ARMCO" IRON insures unequalled rust resistance and life-time service.

Specify "Armco" (American Ingot) Iron and insist on seeing the Triangle Trade-Mark on every section. This is your assurance that your taxes are being spent for the public benefit.

For full information on "Armco" Iron Culverts, Flumes, Sheets, Roofing and Formed Products, write the manufacturer in your vicinity, or

ARMCO IRON CULVERT MANUFACTURERS ASSOCIATION
Cincinnati, Ohio

fall for the year ending June 30, 1914, was 28.70 inches and for the previous year 8.84 inches."

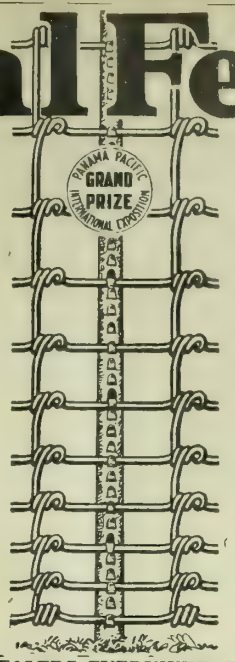
Obviously the wheat yield of 51.6 bushels was in part due to summer fallow, and yet such fallow could have saved little moisture from a preceding year of drought. The good use of the generous rain of the current crop year had more to do with the yield.

During the three years 1908, '09 and '10, the average yield of all wheat varieties grown, many of which were poor, was 40.4 bushels at the University Farm, 35.2 bushels at the station near Tulare and 33.2 at the station at Ceres. During the same three years the average yield for the state was 14.5 bushels.

What All the Figures Signify?— We have presented these figures to support the contention that California soils are not as seriously reduced in fertility as common conversation too often represents them; that they are still responsive when they are given a chance; that during the decade 1905-14 the average annual wheat yield of California was 15.4 bushels while the average of the United States was 14.8 bushels; and that the general agriculture of California, as it presses forward toward better understanding and toward more intelligent and economic work with the soil, still has an exceptionally good foundation to build upon. As, then, we glance back at our thesis: What is the determining factor of greater success in "getting more from the soil"? the answer must be that **to reach greater success we must do better farming.**

It is obviously impossible in a single article in which it is our purpose to present interesting facts, rather than to preach from them, to consider thoroughly in what better farming consists. We shall choose a few factors of better farming and try to present them suggestively rather than exegetically. Suppose we take five of them and ask our readers to think them over for themselves.

Significance of Soil Condition.— Nothing has been so strongly emphasized during the last decade than that the chief loss of California soils, by current farming methods and policies, is the reduction of the content of organic matter. The scientists have shown us clearly that this is a direct loss of things which plants need for free growth, and they have shown also that as decaying organic matter in the soil is reduced its activity which ministers indirectly to the growth of new plants is also reduced. This matter has been explained in detail in our columns during recent months by Dr. C. B. Lipman and others and it is making a deep impression. Nearly everyone is thinking or doing something toward securing stable manure or green manure or both, and the more there is done in this line the better is the start toward better farming. And those who are being thus convinced and converted in their farm policy may be interested to know that there is nothing really new in this conviction even in California, although we do now know much better the reasons for holding it. Let us go back to that 1858 annual address by Wilson Flint, to which we have previously alluded, and read this:



"That horticulture in California has many difficulties to encounter is evident from the fact that our soil is of recent secondary formation and is generally deficient in those rich leaf molds which can only be produced by the rotation of forest trees. To supply this deficiency is the first thought of the scientific horticulturist, and I may remark that this constitutes the material difference between agriculture and horticulture. Agriculture looks mainly to the largest breadth of acres under subjection, erroneously calculating that the more acres planted the greater the profits—a system of impoverishment and exhaustion, which by succession of crops, garnered and sent to distant markets, return none of the atoms drawn from the land, but meets the demand of a famishing soil with a cheaper and more superficial cultivation"—and then follows the statement about the reduction in the yield of cereals which we have quoted above.

Mr. Flint seems to have had a

(Continued on page 401.)

Royal Fence

HAS great strength and resiliency. Made of big, strong, stiff steel wire, with continuous stay wires from top to bottom wrapped around each horizontal wire and securely held by the Royal loop.

American Steel Fence Posts

Cheaper than wood and more durable—last a lifetime. Hold fence secure against all conditions.

AMERICAN STEEL & WIRE COMPANY

CHICAGO NEW YORK PITTSBURGH CLEVELAND DENVER

Pacific Coast Rep.: **U. S. Steel Products Co.**, San Francisco, Los Angeles, Portland, Seattle

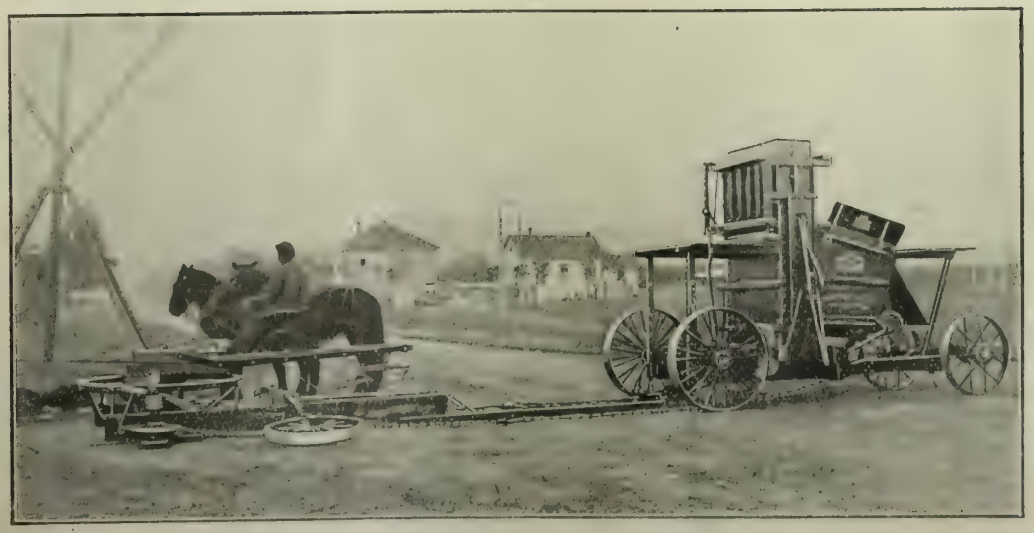
P. & O. No. 40 Combined Corn and Bean Planter

Furnished with open center or solid concave tires.

The Combined Corn and Bean Planter here illustrated is a machine built by one of the largest manufacturers of planters in the world, particularly to meet the requirements of the Pacific Coast trade.

It is not a made-over machine but is built from the ground up for Coast needs. This fact, together with the reputation of the P. & O. Company for building tools right in every detail, insures absolute satisfaction to every user of this planter.

It's the Way They are Built



FEATURES:

Equipped with a full set of plates for planting any of the different kinds of corn or beans commonly planted in California, including Egyptian and Kaffir corn.
Adjustable to any width rows from 28 to 44 inch. The check rower machine is adjustable for checking rows 3 ft. 4 in., 3 ft. 6 in., and 3 ft. 8 in.
Accurate planting insured by the sight feed. Sight feed has a large opening, and the seed is visible at all times to the operator as it drops from the hopper to the upper valve.
Quick, detachable runners held on the shank by one bolt. Easily removed for sharpening.

Write for descriptive circular and address of nearest agent.

Size of bales, 17x22 to 22x30. These Presses can be seen in operation at our factory at all times.

Write for particulars regarding our 1916 Portable Horse Power and Gas Balers, guaranteed to excel all others in workmanship, durability and capacity. We make both 3 and 5 Wire Bale Presses.

General Agricultural Review.

CITRUS AND SEMI-TROPICAL.

Several people are setting out acre lots or more of feijoas, according to F. O. Popenoe of Altadena.

Three carloads of grapefruit trees were recently received in the Imperial Valley in one day—one each at Imperial, El Centro, and Heber.

Avocados should be shaded the first year in orchard form by a canvas stretched over two vertical sticks set on the south side of the tree.

The Whittier Citrus Association cleaned up their navel oranges this week. There were about 175 carloads. They expect to handle between 400 and 500 cars of Valencias.

Six young avocado trees of several varieties were sent to Egypt last week by the West India Gardens of Altadena. About a dozen were successfully shipped to Egypt last summer.

The Oroville Citrus Association recently met and elected the following officers for the coming year: E. W. Fogg, president; Ed. Harkness, vice-president; and F. W. Eilerman, secretary and treasurer.

Black snow falling from orange trees when the plow outfit would strike branches, was the experience of P. F. Ryan of Downey who had sprayed about an acre of badly scale-infested and soot-covered trees with Shurekil spray.

In order to prevent the destruction of perfectly good orange trees from seepage water, 3,000 feet of tile has been laid on the Whitney ranch, Loomis, Placer county, at a cost of 25 cents a foot, to drain the different "wet spots" on the ranch.

A 12-acre citrus orchard of large trees most severely infested with purple scale was sprayed with Shurekil spray last fall for M. E. Wallace of Anaheim. The leaves mostly fell off, but the vigorous crop of new leaves are clean.

The Anaheim Citrus Fruit Association plans the erection of an ice factory and precooling plant to cool its own fruit before shipment. The cost of the venture will be $50,000, but it is expected to save members of the association many thousand dollars annually.

At a mass meeting at Lindsay on March 18, three hundred citrus growers of Tulare county, members of the Tulare County Protective Association, expressed their willingness to conform to the Federal regulations concerning the 8 to 1 test, in shipping their 1916 crop.

Citrus growers of the 1860-acre tract on North Whittier Heights are working for the organization of a local of the California Fruit Growers' Exchange. Their trees are just coming into bearing, and much of the fruit has been hauled over the hills to Whittier, six miles away.

A missionary on furlough from India took back with him last summer a number of varieties of avocado trees among other fruits. He recently wrote to F. O. Popenoe that they were creating great interest and the Indian Department of Agriculture wanted to get some from him or from California for trial.

E. E. Forrister of Imperial county has just planted 650 Marsh seedling grapefruit trees and reports them doing fine. On Mr. Forrister's ranch are other grapefruit trees which were set out a year ago. In addition are peaches and apricots, all of which are doing well. An especially good crop of almonds is looked for this year.

At the recent meeting of citrus fruit men held in Los Angeles to confer with State Market Director Weinstock, all the conflicting citrus fruit shipping interests were able to come together as a unit in agreeing to the tentative plan outlined for the creation of a State Bureau of Distribution under the direction of the State Market Director. The proposed plan has in view the selection by the shippers, representing 100 per cent of the output, of an Advisory Council of five, who in turn will nominate as executive head of the Bureau of Distribution the most competent and efficient man to be found anywhere in the United States. This nominee will be appointed by the State Market Director as head of the Bureau of Distribution. His duty will be to gather and furnish to the shippers accurate daily information as to the needs of the markets of the country for citrus fruits, thus enabling the shippers to intelligently supply the markets of the country.

OLIVES AND NUTS.

Dan H. Whisman is planting 800 olive trees on his 13 acres near Paradise. L. A. McCandliss, also of that section, is setting out 500 olive trees on his land.

A lot of folks have land they want planted to walnuts, but do not now have money for the trees, according to Geyer Bros. of Alhambra. One man wanted to trade alfalfa hay for trees.

The Arizona Commission of Agriculture and Horticulture has issued a quarantine order to take effect April 1, 1916, prohibiting the further importation of olive trees, nursery stock, and rooted cuttings from other states and foreign countries in order to protect the olive industry of Arizona against the introduction into the olive orchards of the State of insect pests and plant diseases.

B. B. Le Baw of Chino, who for seven years has watched and studied the walnut growth of various kinds in that district, claims that seeded crops of walnuts as a whole do not do as well as budded stock. The Placentia stock, he claims, is superior to any variety tried out in the Chino section. Mr. Le Baw claims it to be a duty of the Secretary of the Walnut Association to advise newcomers as to the most suitable variety to be planted.

DECIDUOUS FRUITS.

C. H. Brown of Gridley is preparing fifty acres of his land for planting prune trees.

Miller & Lux are planting many varieties of fruit and grapes on their Peach Tree ranch in Monterey county.

The Producers' Fruit Co. are preparing plans and specifications for the erection of a new fruit house in Auburn.

As the necessary funds have been subscribed, the cannery of the Lake County Canning Co. will be moved from Upper Lake to Ukiah.

J. F. Benton of Arcata has been appointed County Horticultural Commissioner of Humboldt county to replace Geo. B. Weatherby.

According to the old-time fruit growers, crop prospects for 1916 were never better than at present in Placer county.

A. J. Gallaway of the Table Grove Nurseries, Healdsburg, recently received 80,000 seedling prune trees on myrobolan roots from France.

Many deciduous orchardists around Pasadena are pulling out their trees when notified that if they do not spray them effectively, the county will, at 25 cents per tree.

On March 16, the Directors of the Tulare County Growers' Association met at Porterville to plan cannery activities for the coming season and to arrange for financing the pack.

Quince markets have been no good the past two years, according to Mrs. E. M. Wiley who has one of the largest quince orchards in Los Angeles county. For a few years they paid best of anything.

At a recent meeting of the Lincoln Fruit Growers' Association held at Lincoln, plans were discussed for the organization of a fruit shipping company with Lincoln as the shipping point.

G. W. Harney, Horticultural Commissioner of Yuba county, reports heavy shipments of trees and plants into his county, and states that the month of March will add much to the total shipments as Yuba county's horticultural interests are expanding rapidly.

GRAIN AND FIELD CROPS.

LeRoy Little, pioneer grain rancher of the Imperial Valley, has 3000 acres planted to barley this season.

W. C. Colley of Chowchilla is shortly to commence the erection of a grain elevator, with the capacity of 100,000 bushels.

L. E. Wright of Chino has been hauling alfalfa hay the past week, having sold it at $20 per ton. None of his crop has sold at less than $18.50.

Considerable interest is being manifested by the ranchers of Placer county in Sudan grass. It is expected that numerous small, trial patches will be sown this spring.

It is reported that a new rice company, consisting of San Francisco capitalists, is being formed, to plant 2,358 acres in the Traver district of Tulare county.

A petition is being circulated in the Manteca section, asking the Spreckles Company to locate their proposed beet testing laboratory there.

A. M. Standish of Milpitas reports that he has just finished shipping Brocoli in carload lots to New York. This is the first year that the above crop has been grown on any scale in that vicinity.

With a considerable increase in acreage planted to wheat and barley, and many additional acres planted to rice and beans, bumper crops are expected in Sutter county this season.

San Joaquin county rice growers met on March 18 at Stockton and formed the Rice Department of the County Farm Bureau. The meeting was addressed by W. W. Mackie of the University of California.

Sonoma county will shortly have a branch of the West Coast Potato Growers' Association formed there; and a strenuous effort will be made by the leading potato growers of that county to have a University experiment station established there.

The first alfalfa hay of the season in the Modesto section was cut last week, but it was found that it contained very little substance when allowed to cure. However, most of it is being fed green, and fed in connection with old alfalfa or concentrates, causes an increase flow of milk. A number of farmers are pasturing part of theirs.

GRAPES AND SMALL FRUITS.

The California raisin crop is now three times as large as that of Spain, according to a statement by the Dept. of Agri. About 60 per cent of the crop is grown in Fresno county alone.

According to a report by Horticultural Commissioner Wm. Gould of Yolo county, over 30,000 seedless Sultana grape vines are being planted in the immediate vicinity of Woodland.

Thirty-one buds of the Lue Gim Gong orange and eight of the Sampson Tangelo obtained from the Riverside Experiment station were inserted in heatlhy seedlings March 11 by H. A. Randall of the Randall Bros. Nurseries, Whittier.

Choice Rice Land

320 Acres (Tulare County)

2 Good Artesian Wells, with good flow of water. Pumping plant installed at one well which will supply over 100 inches of water.

There is a **big bargain** in this for cash. Will sell all or divide it. 1½ miles to Railway Station.

Also 580 acres in same section. One fine artesian well, with good flow; also a pumping plant that furnishes over 100 inches of water, good 5-acre reservoir.

Will sell one-half or all at **bargain.** Located on Railroad.

Address: E. ALBERTSON, Whittier, California.

John Deere Implements

John Deere Disc Plows for Tractors

For Field or Orchard

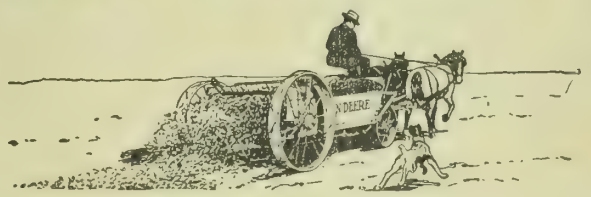
MADE especially for use in the West. Work successfully in every soil where a disc plow should be used.

Plow anywhere from five to twelve inches deep.

One-man outfits—controlled by man on the tractor. Work with any standard tractor.

Can be used either for field or orchard work simply by changing the land axle.

All levers down close to plow when at work—plow can be operated close to trees and under limbs without injuring them.



Easily transported—special lever at the rear for lifting discs high and level.

Over fifteen inches clearance under beam; twenty inches between discs.

Twenty-four or twenty-six-inch discs with chilled metal bearings—constructed so that bearings do not drag along wall of furrow when plowing deep.

Can be reduced to four discs by taking off one intermediate section and telescoping connecting rods.

Write for free booklets describing the John Deere Tractor Disc Plow No. 10 for field work and No. 11 for orchard and vineyard.

John Deere Spreader

The Spreader with the Beater on the Axle

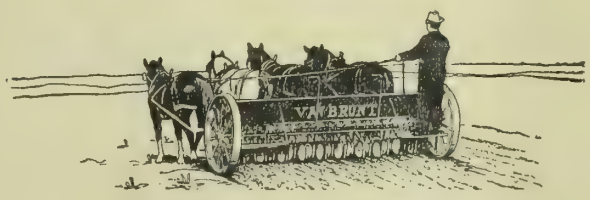
ONLY hip high to the top. Wheels out of way when loading. Mounting the beater on the axle is patented. Write for Spreader booklet.

Three exclusive John Deere Spreader features:

[1] Beater on the axle—nothing else like it. [1]

[2] Revolving Rake—load moving back to beater revolves the rake. Draft actually less. Even spread certain—no bunching. [2]

[3] Ball Bearing Eccentric Apron Drive—requires no attention. Performs wonders in the working of the spreader. [3]



R. & V. Engines

Dependable Farm Power

"R & V" Triumph—always develops rated horse power—made in 1, 1½, 2½, 4, 6, 8,10, 12, 16 and 20 H. P. sizes, stationary and portable.

Easily started; perfect speed control (speed can be varied 40 per cent without stopping engine). Complies with insurance regulations. Hopper cooled—a simple, efficient system that does not require long pipes and numerous fittings.

High grade throughout. Inspect the extra guard ring over piston pin to prevent possibility of scoring cylinder. Ask about the "R & V" oscillating magneto. Write for free booklet.

Van Brunt Drills

With Adjustable Gate Force Feed

THEY plant any small seed, alfalfa to bearded oats, peas or beans.

Amount sown per acre easily regulated merely by shifting feed gauge levers.

All the ground sown, because the Van Brunt adjustable gate force feed and special agitator in the hopper compel seed to leave hopper in even, continuous streams—no bunching or choking up—and an equal amount goes into each furrow.

An even stand of grain is secured, because pressure springs compel all the discs to cut furrows of even depth, and the closed delivery places seed at bottom of these furrows.

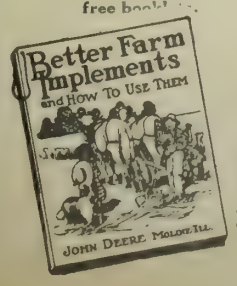
Van Brunt Drills do not clog up. Scrapers keep discs absolutely clean.

Smooth running—each wheel drives half the feeds, equally distributing the work. A direct, double, gear drive from the continuous axle.

High grade discs with bearings that are guaranteed to last lifetime of drill. Either single or double discs.

Grass seeder attachment can be furnished which will drill or sow broadcast as desired. Write us for free booklet.

John Deere Plows for Light Tractors



For Orchards and Vineyards

PRACTICAL—one-man outfits. Work with any standard tractor. Controlled by man on the tractor.

High and Level Lift—Pull the rope and all bottoms raise high and level. Another pull lets them down. Plows do not clog or gather trash on the turn.

No levers—plows leveled and depth regulated by screw device. Can be run close to trees and vines without injuring branches.

Regular with three or four 12-inch bottoms. Quick Detachable Shares—save 80% time changing shares. Write for free booklet describing light tractor plows for orchard and vineyard, or regular field work.

John Deere Dealers Everywhere

Better Farm Implements and How to Use Them

BOOK FREE—168 page reference book—tells all about a complete line of farm implements and how to adjust and use many of them. A practical encyclopedia of farm implements. Worth dollars. Describes and illustrates: Plows for Light Tractors; Steel and Chilled Walking and Riding Plows; Disc Plows; Cultivators; Spring Tooth and Spike Tooth Harrows; Lister Plows and Cultivators; Disc Harrows; Alfalfa and Beet Tools; Farm and Mountain Wagons; Teaming Gears; Manure Spreaders; Inside Cup and Portable Grain Elevators; Corn Shellers; Hay Loaders, Stackers, Sweep Rakes, Mowers, Self-Dump Sulky and Side Delivery Rakes; Hay Presses; Kaffir Headers; Grain Drills and Seeders; Grain Binders; Corn Binders; Gasoline Engines. This book sent free to every one who states what special implements he is interested in and asks for Package No. A-152.

John Deere, Moline, Illinois

Mechanical Power on the Farm.

TRACTOR PLOWS AND DIGS BEETS.

[Written for Pacific Rural Press.]

A 110-acre sugar-beet patch was plowed 18 inches deep last winter by J. Buchheim of Tustin, Orange county, with his 65 h.p. Caterpillar. The job was finished Jan. 8 except a piece which was too wet even for the 16-inch track. Then in mid-February he had a 3-day job harrowing six inches deep with spring-tooth harrows. There were five sections each four feet wide, all hinged together, and weighted down with stumps. He said he usually pulled 6 sections. This required about 30 gallons of distillate per 9-hour day.

Right after the harrowing, he planted the beet seed in rows 18 inches apart. He does not cultivate with the tractor, but plows out the beets, four rows at a time, in the fall, using a 10-inch track on the engine instead of the one 16 inches wide.

PUMP INCREASES CROPS.

[Written for Pacific Rural Press.]

A fine crop of Royal apricots last year on 37½ acres, and about the best prospects for this year, in a sandy country where some folks are struggling along with dry farming are due principally to two things, one of which is pump irrigation. This is what the owner, G. H. Waters of Pomona, thinks of his orchard southeast of Ontario.

Lifting 125 inches of water over 100 feet to the surface with a 50 h. p. motor and a Layne and Bowler pump does not seem expensive when extra returns are greater than the expense. Pumping does not lower the water level here, as the well is 356 feet deep. The motor does not seem to be really working.

According to J. C. Martin and J. B. Moore, who have charge of the ranch .and do the work, the light sandy top soil is 12 feet deep at the well. The soil varies at different points in the orchard so that, applying the whole 125 inches at once in checks, requires a day to irrigate three acres in some places, while five acres have been irrigated in an afternoon. Water is delivered at the edge of the orchard through burnt sewer pipe cemented at the joints.

The pump was supposed to deliver 100 inches of water, but it didn't, so a larger pulley was put onto the motor and the flow increased to 125 inches.

The outfit is used to water the apricots, a small peach orchard, a field of alfalfa, and perhaps some of the neighboring ranches, for there is far more water than can be used on this place.

PUMPS OVERHEAD IRRIGATION.

[Written for Pacific Rural Press.]

One of the few overhead orchard irrigation projects in California is that of D. J. Overholzer of Covina. While 10 acres have been irrigated this way through several years, the system is not being extended, though Mr. Overholzer irrigates entirely this way on this block, and has no intention of changing the system. The trees are old ones and mostly over 15 feet tall.

An electric pumping plant is located at the middle of one edge of the orchard. An underground pipe leads directly across center and is connected to about a dozen upright 2½ inch pipes about 15 feet tall.

From each of these an inch-and-a-quarter pipe extends several lengths in each direction sidewise across the orchard. These are extended to the edge by inch or ¾-inch pipes, all hung about 12 feet high from wires run over the tops of four vertical 2½-inch pipes on each side of the central line. Alternate rows of these vertical posts are supported by another wire crosswise and some are guyed to the ground.

All of the lateral pipes are fitted with patent sprinklers. These throw the water to one side or the other as the lateral pipes are rotated a quarter turn or more. The rotation is accomplished by a pair of levers on each pipe, along the central supply line. The ends of the levers of the various laterals are connected by wires running over pulleys to the pumping plant where all are turned at one operation by pulling one wire or the other. Any lateral may be shut off by hand cocks.

IS DISTILLATE STRAINING DANGEROUS?

To the Editor: I read in your March 4 issue a letter from J. N. Odell regarding the danger of gasoline straining. Kindly advise through your paper if this also applies to distillate.—J. P. T., Roseville.

[Answered by J. N. Odell, San Francisco.]

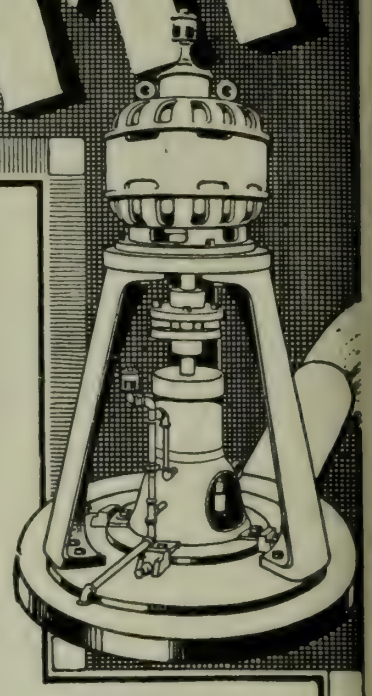
[Although distillate straining is not so hazardous as gasoline straining, the risk is still there. The difference in degree is due to the fact that distillate is less volatile than gasoline and therefore does not evaporate quite as quickly. Many overlook the fact that the danger of explosion is not in either liquid, but in the gas generated therefrom. The moment either gasoline or distillate is exposed to air the formation of gas begins, and the danger of explosion exists.]

SIPHONING A WELL.

To the Editor: I have a well of water that I want to siphon. It is 250 feet from the raise and the raise is 12 feet. I have 150 feet of inch pipe and 1600 feet of three-quarter inch pipe. Where is the proper place to put the inch pipe: at the well or at the outlet?—Subscriber, Brentwood.

[Answered by S. H. Beckett, University Farm, Davis.]

[In placing the siphon which the subscriber describes the larger pipe should always be placed at the suction end of the siphon, which in this case would be at the well. With a siphon of this length, it is advisable that a tee, valve and suction pump be placed at the highest point, which will allow easy priming at any time. You will also realize that under the conditions stated, with such a long length of small diameter pipe, the discharge through the siphon will necessarily be very small.]



CHOPS SILAGE AND ALFALFA.

[Written for Pacific Rural Press.]

Chopped alfalfa, beet pulp, and green barley or silage make up the ration fed in the milking barn to 160 milk cows on the Handorf Dairy ranch in Los Angeles county.

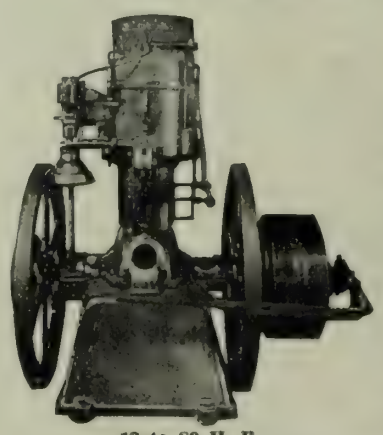
They claim to be able to store much more alfalfa chopped than

Layne & Bowler PUMP

Small Cost

When one considers the greatly increased profits and succesful crops that are absolutely assured year in and year out, because of being able to depend upon a reliable pumping plant, the cost of installing such a system is very trivial. No better investment can possibly be made.

With the introduction of the **Layne & Bowler** pump, which was perfected after years of experimenting and the expenditure of thousands of dollars, all the exasperating pumping troubles of the past disappeared.



Layne & Bowler Pumps are constructed in different sizes to meet absolutely every requirement. Write for Catalog No. 25.

Layne & Bowler Corporation

900 Santa Fe Avenue, Los Angeles.

READ MILLER CO.

Victory Oil MOTORS

12 to 80 H. P.

MEET EVERY REQUIREMENT.

When buying an engine take the first cost, plus the operating cost, plus the interest on your investment, and the **VICTORY OIL MOTOR** will be the safest investment.

They mean steady power, less vibration, smoother running. They are simple and dependable. No valves, cams, gears, or small troublesome parts. Anyone can understand and operate them. No engineer is required. The **VICTORY OIL MOTOR** operates on the low grade fuels without sooting or clogging, and will cut your operating cost in half. Let us figure on your complete irrigation system. Our guarantee covers everything.

Victory Motor Co.

NILES, CALIFORNIA.

Farms from $15 per acre up. Write for beautiful magazine, official lists, maps and other information, Free.

N&W

F. H. LaBAUME, Agr. and Ind. Agent, Norfolk & Western Railway, Room 119 N. & W. Bldg., ROANOKE, VA.

loose, and the cattle eat it cleaner. They would not do without the chopper now.

It has a 36-inch cutter and is run by a 40 h. p. Fairbanks-Morse induction motor. It is bolted to the concrete floor. The blower places chopped alfalfa at the other end of the big corrugated iron barn which is about 50x100 feet and 25 feet to the eaves. No hot dusty mowing away is needed as with hay.

Three or four teams are kept busy on an average haul of a half mile; two men throw from the wagon and one feeds the machine. The same machine cuts corn silage and blows it via an overhead pipe into the silo some 30 feet away.

ANTI-RUST PREPARATION.

An ounce of camphor dissolved in a pound of lard is a good anti-rust preparation that farmers may use to cover the bright parts of their machines. The scum that forms in making this mixture should be taken off. If it is desired to have the preparation the same color as the machine, lead may be added. The mixture should be applied to the well cleaned parts and allowed to remain about twenty hours. Any excess may be rubbed off. The mixture forms a coating that will take a good polish when rubbed with a soft cloth. Axle grease is also excellent for keeping plow bottoms from rusting and may be used for the bright parts. Paint is a good rust preventive but hard to get off. —O. A. C. Bulletin on Care of Farm Machines.

WHY FARMERS BUY MOTORS.

An automobile manufacturer makes the following declarations: The auto show at Kansas City demonstrates that the preceding shows in New York and Chicago were not bubbles, inflated Eastern war prosperity and the wealth of the big manufacturing and financial centers:

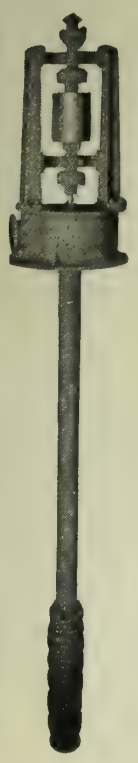
"Kansas City's show draws mostly from the rural dealers and the farmers in the center of this country's great corn belt. It is meeting that gets close to the soil and the business that it develops comes from the furrows of the plow, and not from the quotations on the ticker.

"The stupendous amount of business done—and wholesale business at that—reflects the stability of the agricultural business of the country. When the farmers flock to buy automobiles it means that there is wheat and corn in the ground that promises well, that the foodstuffs, which are the backbone of all industry, are in good condition.

"The Kansas City show simply backs up the prediction made after the larger ones. This will be a tremendous year in the motor car world."

Grind the valves.

Keep the engine clean.



Keep plenty of oil in the lubricator.

Don't get the magneto wires oil or water soaked.

No Pit

is required with the

Krogh Deep Well Turbine Pumps

For bored or drilled wells from 10 inch inside diameter up; and for capacities of 250 to 3000 gallons per minute. Built for pumping from any depth to and including 250 feet. Success in Raising Pigs.

[Written for Pacific Rural Press.]

A bunch of 133 strong, lively, hungry little porkers from 14 sows or an average of 9½ per sow is something to be proud of. The Oak Grove Dairy Farm at Woodland is the owner of these pigs, all of which are out of registered sows and sired by an eight and a half year old boar that weighs 950 pounds.

In order to get a record like the above it is necessary to select sows that are known to produce large strong litters, whose sires and dams were of the same qualifications, and then breed them to a male whose breeding record is known. Many a good breeding animal is slaughtered.

Ancestors are not all, however. It takes the right feed and feeding to develop the little fellows. This should start long before they are born. On the above farm the sows are fed a bone and muscle building ration, such as middlings, bran and tankage, a good mixture being 40 pounds of middlings, four pounds of bran and four pounds of tankage.

This is fed in the form of a slop, the amount fed depending upon the sow. Although no set rule can be given, the sow should be kept in good condition. We might add that a hog Mr. Armstrong, the manager, calls simply in good condition would be called fat by others. At no time should she be allowed to go down in flesh, as this stunts the little pigs in the making and as a result makes weak pigs at farrowing time.

Plenty of exercise is also essential for brood sows and boars, it being as necessary for the boars to be strong and vigorous as the females.

After the sow farrows enough of the above mixture is stirred into a gallon of water to make a very thin slop. This is gradually increased in thickness and as the pigs grow and are able to eat, barley is added, so that by weaning time the ration is composed of the above with 32 pounds of barley added. Cleanliness is essential at all times. A good dry place to sleep has saved many a pig.

SEPARATED MILK FOR PIGS.

To the Editor: Can you tell me if separated milk will hurt sows or the pigs, in a week or two? We have heard it will give sows milk fever.—C. F. W., Mulberry.

[Answered by Prof. J. I. Thompson, University Farm, Davis.]

Some undesirable results have been secured when skim milk direct from the separator was fed to sows or sows and pigs in considerable quantities. Unless a sow is known to be a very light milk producer she should not be fed any skim milk until the pigs are a week, and preferably ten days, old. If, at that time, the pigs are handling all that she is producing and capable of using more, it is advisable to begin feeding her a small amount of milk each day and increasing it gradually according to the needs of the sow and pigs. Overfeeding of the milk would cause an overproduction by the sow, which would either result in scouring the pigs or, if they were unable to take it, it might produce milk fever in the dam. Some unfavorable results have also been secured when the spout of the separator was allowed to empty directly into the hog trough, and the pigs were permitted to accumulate about the trough while the separating was going on. This trouble is caused by the milk flowing into the trough so slowly that the pigs, in attempting to drink it, get a considerable amount of air with the milk. The froth and foam on top of the milk also causes them to consume more air than they ordinarily get in this manner, and the result has been serious scouring.

The remedy for the latter is to keep the pigs away from the trough until the separating is finished.

YOUNG PIGS EAT ALFALFA PASTURE.

[Written for Pacific Rural Press.]

Alfalfa pasture is the first solid feed of many pigs, which begin to eat it at or before two weeks old as observed by Hawley Bros. of Madera, C. C. Stewart of Orland, and others who have observed no ill effects, but rather a freedom from stunting and setbacks.

Pigs root alfalfa only when they are crowded on the pasture, or, as observed by T. R. Nickalls of Los Molinos, when the tops are short and ground wet. His neighbor, C. E. Barrows, feeds the shoats corn and slop all they want, after which they help themselves busily to all the alfalfa pasture they need without rooting it up. He thinks that a man could make a good living on 20 acres with a dozen purebred sows (though not with scrubs) by planting half to alfalfa fenced into half acre lots, and half into corn or grain. But he figures it wouldn't keep him any busier with such a scheme on a larger place. Henry Webb of Madera has a rotation of crops which supplies much more feed per acre and could thus keep more hogs on a small place. This rotation has been described in another article.

Save Money on Wire Fencing! -send for WHITING-MEAD'S Free 1916 catalog showing how to save money on Building Material

WARNER FARM FENCING, 50c ROD.

—This price in 20 rod rolls. Made of No. 10 galvanized wire with Glidden galvanized barb wire margins. This is an exceptionally good fence, designed to be used for turning both large stock and pigs. The Warner Farm Fence is made with the same tie as other Warner styles. The barbed borders are a great advantage. The barbs on the bottom prevent hogs from crawling under, and those on top prevent stock from reaching over and depressing the fence, while by their being woven into the fence the danger to the stock is removed. It should be remembered that it is just as important to prevent going over or under a fence as to prevent going through.

Bankrupt Stock of Shovels.

About 1,000 at 65c Each. Delivered Free to You.

—Another fortunate purchase, a lot of shovels, about 1,000, all in splendid condition, but from being in a warehouse during recent rains have become slightly water stained, but this in no way affects their usefulness.

—Choice of Long Handle, round or square point shovels, or the "D" handles with round, square or scoop shovels any one of them or as many as you want, 65c each, delivered free within a radius of 100 miles of L. A.

Ready Roofing, $1 a Roll.

—"Our Leader" put up specially for us by one of the largest roofing manufacturers in the world. It's 1-ply smooth finish, and is easily the best value that we have ever had to offer at even a higher price.

—Each roll contains 108 sq. ft. with nails and cement for laying. This will cover 100 sq. ft. of roof, allowing for laps. Other roofings at like low prices:

1 Ply King, per roll.....$1.25
2 Ply King, per roll.....$1.75
3 Ply King, per roll.....$1.75
Snow-White Roofing Paper, per roll $1.75

Paints $1.50 Gal.

—You can buy paints cheaper from us than any other dealer in the West. We buy in large quantities and sell for the lowest prices.

—Standard House and Floor Paints, $1.50 per gal.

—Standard makes of varnishes at 25% off regular prices.

Everything in Paints, Wall Tints, Brushes etc., at big savings to you.

Dutch Kalsomine 4½c per lb

Black Graphite Roof.—per gal.* 50c

Standard Roof Paints—red, green, gray — per gal.* 85c

Shingle Stain, made from pure ground colors per gal.....50c

*In 5 gal. lots only at this price.

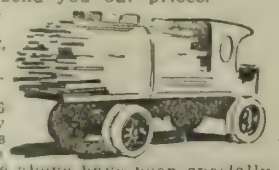
Plumbing.

—Our plumbing department is exactly the same in variety as carried by any of the big "standard price" plumbing jobbers, bought from the same factories. But we buy in tremendously large quantities and at the same time take some seconds and slightly imperfect goods and get big reductions on regular prices.

—We make you the most exceptionally low prices as a result, so that no matter what you want in plumbing, from a $40 (regular)) bath tub at $35 to a somewhat imperfect lavatory, the $7 grade at $4 —Send us your plumbing list and we will show you in dollars and cents that it pays to trade with us.

75c Shingle Stains, 40c Gal.

—A special lot of shingle stains that we have secured in an unusual way and so offer them at about half price. Specially made for use in this climate. Choice of brown, yellow, red, and black. This price in 5 gal cans only.



—This shingle stain is Railroad salvage from the recent floods, and on account of being wet many of the cans lost their labels and became mussed up, but the contents are absolutely O. K.

Lumber.

—A few items that should give you an idea of how you can save money ORDERING BY MAIL from us. We carry a full and complete stock of lumber, both rough and finished at all times, and will cheerfully send you our prices.

1x8 Redwood Shiplap, $22 per M.
1x4 Redwood Ceiling, $20 per M.
⅛x4 Plain Bevel Siding, $11.50 per M

—The last item, in 6 to 10 ft. lengths only and F. O. B. the cars at Los Angeles at this price. All of the above have been specially run through the mill from common lumber, especially for erecting outbuildings, poultry houses, etc.

No. 1 Redwood Shakes, $15 per M.

—Absolutely number one grade and measure 5 inches by 36 inches.

Windows—Doors—Etc.

—Our Sash and Door Dept. is one of the largest in the Southwest, and occupies one entire floor of our large main building. We have at all times, ready for immediate shipment, everything needed in standard sizes, sashes, doors, screen doors, front doors, etc., etc. SEND FOR OUR PRICES BEFORE BUYING.

$2.50 Woolnap Blankets, $1.40.

—Very fine grey blankets, have attractive colored borders at ends and are well finished, full bed size, just right for chilly mornings. Order early on this item, as we have only about 6 dozen blankets on hand.

Experience in Silo Construction.

To the Editor: You ask in a recent issue for the experience of those who have built concrete silos. Two years ago I built one 14 by 28 feet and by doing the work myself it was not very expensive.

I used five tons of Portland cement at $13 a ton, 700 feet of lumber for forms at two cents a foot and $12 worth of hog wire fencing for reinforcing. The forms were four feet high, cut in eight sections, sheeted with resaw, and studded with 2 by 3's. The circle was cut out of 1 by 12's. The silo is six inches thick at the base and three inches at the crown, and plumb inside. It was flattened slightly at the doors, inside, to increase the thickness there, and wires were lapped at the doors to double their strength.

I mixed and raised the concrete with a 2 h.p. gas engine, using a 50-gallon barrel for mixing and the hay carrier and cable from the barn for raising the scaffold and derrick. The lumber was all used for other purposes. I still have the forms, which can be used either for a larger or smaller silo by putting in a section or taking one out.

I painted the silo inside and out with clear cement as fast as it was stripped and scraped. It has not cracked and I have not had any silage spoil around the sides. It has a capacity of 80 tons. **J. E. Mount.**

Newman.

[Cement f. o. b. San Francisco at the present time is worth at the rate of $23.80 per ton, so it is evident that your cost was lower than can be expected at this time.—Editors.]

THE FARMER AND THE GAME LAWS.

To the Editor: You are certainly to be congratulated on the article, "Jackasses and Jackrabbits," in your issue of March 11. If anybody needed help it is the farmer from the present game laws.

The farmer is furnishing the feed and water for all the game in the State. The State charges $1.00 for the privilege of hunting and turns the hunter loose on the farmer without so much as giving him the protection of a game warden against trespassing.

On top of this there are people going around the State telling the children that birds, eating our vegetables, fruit, grain, Xmas berries and angle worms, are a benefit and should not be killed.

Robins ate five tons of olives around St. Helena this fall before the oil mill opened for work. They cleaned up 500 pounds of persimmons, pucker and all, for me. I could not save half a box, nor had I a right to eat the robins I killed in trying to save the crop.

Angle worms are "nature's soil makers" and the birds destroy them on every hand. When rabbits, mud hens, tree squirrels, robins and deer get thick enough to satisfy the law makers, what will become of us hill farmers?

Talk about the high cost of living! I will raise 15 head more cattle if the State will keep its game off my ranch, and if it will keep its hunters off I will add five more to that, besides more poultry and several hundred watermelons; and over one-third of the farmers of the State could gladly make a proportional addition to their crops.

It is hard to tell sometimes whether the farmer or the game belongs in the pot, but if the Rural Press can get the jackasses classed as predatory animals, to be shot on sight, it will go a long way to solve the question. **H. Overacker.**

St. Helena.

BUTCHERS OWN HOGS.

Mr. George Elicker of Napa county has been killing hogs and selling the meat to the neighbors. The following is some of the data in regard to whether it pays to kill hogs or to sell them directly to the hog buyer, as stated in the Farm Bureau Monthly. These hogs would have sold to the hog buyer at 6c per pound live weight. Mr. Elicker killed them and sold all the meat, with the exception of the head and liver, at 12c per pound. These he sold at 8c per pound.

	Weight alive.	Weight Dressed. Without head and liver.	Head & Liver.
Hog...	95 lbs.	65 lbs.	9 lbs.
Hog...	88 lbs.	60 lbs.	8 lbs.
Hog...	110 lbs.	76 lbs.	9 lbs.
Hog...	87 lbs.	61 lbs.	6 lbs.
Hog...	92 lbs.	67 lbs.	6 lbs.
Hog...	97 lbs.	65 lbs.	8 lbs.
Hog...	90 lbs.	62 lbs.	8 lbs.
Hog...	92 lbs.	65 lbs.	7 lbs.
Total..	751 lbs	521 lbs.	61 lbs.

8 hogs (without head and liver) 521 lbs. at 12c per lb. $62.52

Head and liver of 8 hogs, 61 lbs. at 8c per lb..... 4.88

Amount received from hogs.. $67.40

Butchers' price on 8 hogs, live weight (751 lbs.) at 6c.. 45.06

Difference $22.34

WRONG METHODS OF POISONING SQUIRRELS.

Upon investigating a complaint regarding the efficiency of the Farm Bureau squirrel poison, the Farm Adviser of Ventura county found that it was not being put out properly. When put in bunches the squirrels sit down and shell it, but if it is spread out and they can only find one grain at a time, they store it in their cheek pouches until they have enough to make it worth while to eat. While the poison is in the cheek pouches it gets in its deadly work. Therefore, scatter the squirrel poison.

Auction Sale of Jerseys

At the Rancho Dos Rios

MODESTO

TO BE HELD ABOUT THE FIRST WEEK IN MAY.

DATE WILL BE ANNOUNCED NEXT WEEK

125 Head of Jerseys, of which 40 are registered. Tuberculin tested within 30 days of date of sale.

Surplus Stock from the Rancho Dos Rios Herd.

This herd was originally known as the Mailliard Herd, the foundation of which was imported into this State in 1868 by the well-known breeder, Adolph Mailliard, and which has never been out of the hands of the Mailliard family.

Having a large number of youngsters soon coming into profit, practically the entire herd of cows at present milking will be offered for sale. Among these are about forty head of registered A. J. C. C. females by such sires as—

LAURA LEE'S ISIDRO, No. 57067, A. J. C. C., whose direct male ancestry for four generations back has to its credit 167 cows in the list of tested animals, giving from 14 lbs. to 25 lbs. 2½ ounces in 7 days, and whose dams for these four generations aggregated 263 lbs. 2 oz. of butter in 7 days, which is an average of 17 lbs. 9 oz. per cow, the only female in this line without a recorded test being **LAURA LEE, No. 8550,** who was the dam of five daughters in the tested list.

DORINDA DARLING'S VOLCO, No. 89007, A. J. C. C., whose dam gave 18 lbs. 8 oz. butter in 7 days as a three-year-old, and whose granddam, **PRIDE'S OLGA 4th, No. 96870,** had a record of 27 lbs. ½ oz., and whose sire was a son of the St. Louis Fair champion bull, Merry Maiden's 3rd Son, out of Dorindo Darling, who stood 4th in St. Louis Fair test.

DOS RIOS POGIS, 89008, A. J. C. C., whose sire was a son of the World's Champion 2-year-old Merry Miss, No. 180051, who gave in one year 11.152 lbs. of milk, making 601 lbs. of test butter, and whose dam has a record of 17 lbs. 2 oz.

The dams of these females offered for sale are by such bulls as Brown Bessie's Golden Gate, No. 59477, a grandson of the Chicago Champion cow, Brown Bessie. Rioter Cuba Exile, No. 66055, a strongly bred St. Lambert strain, and other finely bred animals.

Breeding of unregistered stock offered at this sale is practically same as that of A. J. C. C.

Must He Pasteurize His Milk?

To the Editor: I read in a recent issue of the Press about the new pasteurizing law, but do not think we understand it very well. Will you please tell me if we can sell milk to our neighbors if we do not pasteurize it, but sell to them with the understanding that they will sterilize the milk themselves?—M. H., Martinez.

[Answered by F. W. Andreason, Secretary State Dairy Bureau, San Francisco.]

[After October 1, 1916, no person can sell any milk, except at wholesale, no matter how small the quantity, unless his cows have been tested for tuberculosis, or unless the milk has been pasteurized by heating it to a temperature of 140 degrees F. and holding it at that temperature for a period of twenty-five minutes. The milk must then be quickly cooled to 50 degrees F., or lower, and maintained at that temperature until delivered. Pasteurized milk must be marked with the day of week of pasteurization.

Milk which is sold at wholesale to creameries, or distributing plants, is not affected by this law, but before it can be sold to the consumer it must be pasteurized and cooled as described above, unless it is the product of tuberculin tested cows.]

[As the enforcement of this new law will be under Mr. Andreason's supervision his answer to the above question will enlighten subscribers as to how the law, in its present form, will be interpreted by the dairy inspectors.—Eds.]

FEEDING GRAIN TO DIARY COWS.

To the Editor: The following inquiry has been received:

"I see a balanced ration for dairy cows in February 26th Rural Press which you gave 3:2:1 of dried beet pulp, barley and cocoanut meal. Now what I would like to know is, how this is fed to cows, wet or dry? I have been told by some people that beet pulp had to be soaked for 24 hours, or else it would make the cows sick. If that is the case, did you figure that proportion of beet pulp soaked or dry? I would like to try that ration on my cows, so kindly give me full particulars as to the best way to feed. You also state one pound of this ration to every five pounds of milk given by the cow—now to get the amount of feed to be given you would weigh night and morning milk and divide to get an average feed for night and morning, and would you also increase the feed as to the increase of milk flow?—W. L. B., Kenwood, California."

[Answered by Professor F. W. Woll, University Farm, Davis, Cal.]

[Beet pulp may be fed either wet or dry; some farmers prefer to feed it one way, some the other, which indicates pretty plainly that the feeding value of the pulp is not affected to any appreciable extent by the special method of feeding adopted. This applies both to dried plain and molasses beet pulp. Unless it is considered especially advisable to furnish some succulent feed in the ration, the beet pulp had better be fed in dried form, as this means less work, and allows the making up of grain mixtures that can be easily handled. The proportion of dried beet pulp, rolled barley and cocoanut meal given (3:2:1) was meant to refer to weights of dry feds. Amounts of the feeds are conveniently weighed out in these proportions so as to last, say about one week, and are placed in a pile and thoroughly mixed by shoveling. Of the mixture thus obtained, one pound may be fed, on the average, for every five pounds of milk produced by the cow, with alfalfa hay as roughage. The milk is weighed, say night and morning, and the sum divided by 5, gives the amount of grain (concentrates) that the cows may receive per day. I would increase the amount fed in the proportion as the milk flow increases, and would not hesitate to feed more grain to promising dairy heifers or high-producing cows, as these will give good returns for all the feed they eat and will do better on highly nutritious rations than on such composed largely of rough feeds.]

RATE OF LIVESTOCK IMPROVEMENT BY GRADING.

To the Editor: I understand that the first cross between a registered bull and a common cow produces a "grade" animal, and the cross between such a "grade" and another registered sire produces what is called a "full blooded" animal. Is this correct and would the offspring of a further cross with another purebred be known as a purebred? How many crosses would it take to make one as good as a purebred? And can such animals ever be registered? I would be very grateful if you would explain this matter in your columns. —M. W., Cool.

[The following table shows the rate of improvement in livestock as a result of the use of purebred sires on grade cows:

Generation	Sire	Dam	Offspring	Per cent Improvement
1	Pure	Scrub	½ blood	50.
2	Pure	½ blood	¾ blood	75.
3	Pure	¾ blood	⅞ blood	87 50
4	Pure	⅞ blood	15/16 blood	93 75
5	Pure	15/16 blood	31/32 blood	96 875

For utility purposes the fifth generation is theoretically as good as a purebred, but no registry association will register any animal unless both its sire and dam are purebred and registered. If their dams are not purebred and registered your offspring will never be more than grades.—Eds.]

DRAFT-HORSE BUSINESS ACTIVE.

Wayne Dinsmore writes that at a recent meeting of the Board of Directors of the Percheron Society of America, the registration fee on imported horses was increased to $100 per head, taking effect July 1st, 1916. The object sought is to discourage the importation of inferior horses, and it is believed this high fee will have the desired effect. Provision is further made to refund $85 of the $100 paid to importers on horses that are good enough to win at fairs recognized by the Per-

"Selecting and Developing the Jersey Herd"

Is a booklet by Prof. Hugh G. Van Pelt. It tells how you can build a well-developed, money-making Jersey herd by proper selection and judicious breeding. The future of your dairy herd depends upon how you select your foundation animals and how they and their offspring are developed. The Jersey cow combines beauty with dairy conformation. Healthy, vigorous and profit-producing, she lifts the mortgages and increases bank accounts. Send for book today.

"Good News for Farm Women"

Orange, N. J., March 1, 1916

Dear Mrs. Dairywoman:—

The bearer of good news is always welcome; and I have some very good news for farm women. We've a new separator at our house and it's a wonder.

One splendid feature of this new invention which must have been planned with the comfort of the dairy woman in mind is the knee-high supply can. This does away with the hard, high lift no woman should be asked to endure day after day. It's only a few inches to lift and a tilt of the pail, even for a small boy. This is *one* item of good news.

Cleanliness is the beginning, middle, and end of good dairy work. You know how quickly the separator shows the effect of any slight letting up in this direction. With dishes to wash three times a day, cooking utensils, calf pails, milk pails, etc., a big pile of separator disks is just about the "last straw", isn't it? But with our new Sharples there are only three pieces to clean, not one heavy, bulky, or fussy. This is the *second* piece of good news.

Formerly, a slight slowing of speed in turning the handle of the separator meant a loss of cream—and money. One's attention had to be strictly on turning the crank at an unvarying high speed, which was trying to both mind and strength. My *third* and best piece of good news is that

THE NEW SHARPLES SUCTION-FEED

Separator draws up into the bowl just the right amount of milk—always in proportion to the separating force. If you feel out of sorts, you may turn slowly and the bowl will drink up just enough milk for clean skimming and no more. If you feel spry and want to get through to sew, to trim a hat, or to visit a neighbor, turn as fast as you please and the bowl will take up proportionally more milk, yet the cream will be of the same thickness. Smooth, even cream, such as the Suction-feed gives you makes quality butter that brings top prices.

The separator has only one thing to do while you have many tasks. The separator has always been a tyrant which insisted on being turned at regulation speed, whether you were well or ill, worried or happy, rested or worn out. But this new Suction-feed Separator *meets your moods.* Its speed is your speed and yet, it *gets all the cream all the time.*

Why don't you drop a postal to the Sharples people for their new book? Then, you can show your husband that this new invention will be a money saver for him as well as a labor saver for you.

Yours truly,

A Dairywoman

The bowl is easy to wash. There are only three parts, and *no disks.*

What this farm woman says in her letter is absolutely true. There are many other pieces of good news in our new book, "Velvet" for Dairymen, which fully describes this wonderful separator. Send for your copy today. Address Dept. 31.

The Sharples Separator Co.

Also Sharples Milkers and Gasoline Engines

West Chester - - - Pennsylvania

Chicago San Francisco Portland Toronto

cheron Society of America. It is believed this action will effectually bar inferior horses, without interfering with the importation of really valuable animals. Members of the Percheron Society have already been advised of this action, and breeders generally appear to be heartily in accord with the new ruling.

Records in the office of the Percheron Society show an active trade, particularly as to sales made by breeders. Prices are gradually growing stronger on good Percherons, but demand is slack for poorer sorts. More men are seeking stallions of exceptional merit, fit to head pure-bred studs, than at any time in the last three years, and more confidence is expressed by purchasers generally.

More than 112 million dollars' worth of horses, and over 23 million dollars' worth of mules have been exported from the United States in the 16 months ending January 1st, 1916. This is a greater total in cash received than we obtained for all horses and mules exported during the preceding 16 years, and our shipments show no signs of lessening. Good draft geldings are in from $275.00 to $325.00 on the Chicago market, despite the pessimistic comments of country horse buyers, who generally seek to give, for selfish reasons, the impression that drafters are not wanted. Farmers who cannot secure satisfactory prices at home should club together and ship their draft geldings direct to the large markets. Country horse buyers are doing all they can to hammer down prices on drafters in the country, for their own profit, and are having fair success. The war horse demand keeps business going, and if a big drafter is passed by often enough, the farmer who owns him may take the price offered. For this reason, direct shipments should receive consideration.

WANT TO TEST COWS FOR PAY.

To the Editor: Different people have attempted to start a cow testing association in this section, but couldn't make it. I have been thinking of getting an outfit and starting to do testing myself, as I think I can get 300 or 400 cows. Perhaps by starting this way, interest could be worked up and a testing association started. Please let me know the price of tester, sample bottles and acid. Also the charge per cow I would have to make to pay for my time and materials used. Most of the dairies are within a radius of ten miles so that I could be at home nights. I have about a week's time that I could spare for the work each month.—H. C. N., Arroyo Grande.

[Answered by S. S. Bonner, Secretary Gridley Cow Testing Association, Gridley.]

[The charge in our association is $1 per cow per year except in cases that incur traveling expenses to be reached, when it is $1.25 per cow per year. Our tester stops overnight at the different members, weighing the milk night and morning and taking a composite sample which he tests after the morning milking. Your subscriber evidently would not be able to do this and would probably find it would be difficult to hold members, as it takes considerable time for a milker to weigh and sample his milk. The testing would not be worth $1 per cow per year on a dairy of any size. Our charge covers a particular cow for a year's time, including her dry period. We do not allow a substitution when a cow is not in milk.

The price of the tester bottles and glassware could be had by writing any supply house. The cost of acid is very small. Thirty-pound milk scales graduated in 1-10 pounds cost, I believe, $3 each.

I believe your subscriber could, if he obtained 300 cows to test that did not require much traveling to reach, do the work in one week's time. He could weigh and sample at the large dairies and let the smaller dairies do their own weighing and testing. This would mean that he would have to leave a scales, sample bottles, and dipper with these people. The cost of material for this work would not be over $20 per year, including breakage.

With 300 cows at $1 per year, he would have an income of $280 with expenses out for 12 weeks' work, which I think would pay him very well for his time. The outfit should cost between $50 and $75 and I would advise a 24-bottle tester.

By writing the U. S. Dept. of Agriculture your subscriber may obtain daily report blanks and herd books free of charge.]

With the Live Stock Men.

DAIRYING.

Kings county dairymen received a total of $151,000 for the cream delivered during February.

The Danish Creamery in Fresno paid dairymen $42,182.40 for cream delivered during the past month.

A. W. Morris and Syl Lawson have selected the site on which they intend to construct a pasteurizing plant in Woodland.

The Dairymen's Co-operative and the Good Luck Creameries of Tulare county paid dairymen $58,500 for cream delivered during February.

Allen Bros. of Hopland recently sold their 1360-acre stock and dairy ranch east of Hopland to R. Whitehead, real estate man of San Francisco.

H. A. Johnston, formerly of San Francisco, has taken over the old Freeman ranch near Woodland, installing 27 head of purebred Ayrshires.

The Oakdale Creamery is now making a ton of butter a day, breaking all past records for butter production since the plant was started.

On account of promising butter prices in the East, several San Francisco dealers have been shipping their product to eastern points, nine cars leaving on March 21.

The annual meeting of the Stanislaus Cow Testing Association was held at Modesto on March 18, and C. A. Starkweather was re-elected head of the official board.

M. A. Sickles has leased the Knutzen dairy ranch south of Colusa and has had shipped there from Mackinac, Mich., sixteen head of thoroughbred Jersey cows and one bull, valued at $7,900.

The Gardena Agricultural High School is teaching its students the value of purebred stock by making it a part of their work to milk, feed, and keep records on one registered Jersey, four registered Holsteins, and three grades.

The Sherman Indian School ranch near Arlington has just installed a separator for their herd of about 25 high-grade milk cows. They will have a concrete block milk house entirely made by the boys, and will soon begin testing their cows.

A cow giving 90 pounds of milk per day about Mar. 10, at 10 years old, is White Aaggie of Windsor, owned by the Whittier State School. She has made a record of 25 pounds of butter in seven days and is expected to make 105 pounds in 30 days.

Miss A. M. Alexander and Miss L. Kellogg of Suisun recently returned from Ohio, where they attended a sale of Milking Shorthorns, purchasing three cows and five heifers for $7395 and a bull at a high price. The ladies were fortunate in securing the two best cows offered in the sale, as well as one of exceptional quality, and five heifers of the best breeding. The bull is the son of Welcome Lass, owned by L. D. May of Granville Center, Penn.; and the price paid to secure him is the highest ever paid for a Milking Shorthorn bull in this country.

Announcement is made in another column of a big Jersey sale to be held at Rancho Dos Rios, near Modesto. This is one of the oldest Jersey herds in the State and will be of more than ordinary interest. Further particulars will be given next week.

During the past month, creamerymen of Visalia received $29,900 from the Visalia Co-operative Creamery. Butterfat for February brought 34 and 35 cents. The latter price, and that of 34½ cents paid by the Porterville Co-operative Creamery was the highest paid in Tuare county.

The American Jersey Cattle Club reports that Amateur Amy 285973, the Jersey two-year-old senior, owned by J. R. Martin of Satsop, Wash., has completed a very creditable year's record. By producing 10,865.7 pounds of milk, containing 593.54 pounds of fat, Amateur Amy becomes the leading two-year-old in the State of Washington.

HORSES AND SWINE.

On March 8, Wm. Bernstein of Hanford shipped a fine eight-months-old boar to John Baker of Honolulu.

A swine growers' organization is under consideration by hog raisers in the Antelope Valley, Los Angeles county.

H. P. Slocum & Sons of Glenn county recently sold two carloads of Duroc-Jersey hogs to the Fontana Land Co. of Riverside.

Chas. Gatewood & Sons of Fresno report having recently received two Poland-China gilts and a boar from Geo. Ruby's herd of Lacey, Iowa.

The Comstock ranch of Lincoln are disposing of their fine stable of race horses, and are stocking the ranch with registered cattle and sheep.

The California Swine Breeders' Association has definitely decided to hold a consignment sale of all breeds of hogs in connection with the Butte Spring Exposition on May 24.

Scott S. Southworth of Napa reports the sale of 10 nine-months-old gilts to Duveneck & Pickersgill of Ukiah; a service boar to Wm. Smyth of Napa; and a gilt to J. C. Sweet, Napa.

A. M. Standish of Milpitas states that during March to date he has sold three registered Duroc-Jersey boars to J. A. Angle of Willows, Chas. Reed and Tony Brandon of Milpitas.

A meeting of the Yolo County Berkshire Association was scheduled for March 18, for the purpose of strengthening the new organization and adopting constitution and by-laws. Plans for the holding of a Berkshire sale at Davis the first week in April were to be discussed.

Prof. J. I. Thompson of the University Farm at Davis writes: "It has been definitely decided that a Berkshire sale will not be held at the University Farm on May 6, as previously suggested. It was impossible to find a sufficient number of suitable hogs for this consignment in this immediate neighborhood."

R. J. Merrill & Sons of Morgan Hill write: "We have recently sold Berkshires to the following parties through our ad in your paper: One bred sow to Dr. R. W. O'Bannon of Hollister, four bred sows to A. B. Thomas of Gilroy, and one boar and sow to Bert. Patrick of San Francisco, for export to South America."

CATTLE AND SHEEP.

Twenty-three cents per pound was paid for lambs' wool at San Francisco this week.

E. H. Tryon is planning to double the capacity of his wool scouring plant in Stockton, because of the great increase in the wool industry in California and the high prices

We Are Prepared

Within the wide boundaries of our country, embracing more than three million square miles, dwell a hundred million people.

They live in cities, towns, villages, hamlets and remote farms. They are separated by broad rivers, rugged mountains and arid deserts.

The concerted action of this far-flung population is dependent upon a common understanding.

Only by a quick, simple and unfailing means of intercommunication could our people be instantly united in any cause.

In its wonderful preparedness to inform its citizens of a national need, the United States stands alone and unequaled. It can command the entire Bell Telephone System, which completely covers our country with its network of wires.

This marvelous system is the result of keen foresight and persistent effort on the part of telephone specialists, who have endeavored from the first to provide a means of communication embracing our whole country, connecting every state and every community, to its last individual unit.

The Bell System is a distinctly American achievement, made by Americans for Americans, and its like is not to be found in all the world.

Through it, our entire population may be promptly organized for united action in any national movement whether it be for peace, prosperity philanthropy or armed protection

that are being obtained on account of the war.

More than 30 carloads of Nevada cattle have come over the Oakland & Antioch Railway to the Montezuma hills in Solano county the past few days, where they will be pastured. Probably some of this stock will be shipped back this summer, but it is believed that there will be an important addition to the northern California supply.

MISCELLANEOUS.

The annual picnic at the University Farm will be held at Davis on April 22; and plans are being made to make this celebration exceed those of former years.

At a recent gathering of San Joaquin Valley cattle and swine raisers held in Fresno, a committee was named to devise ways and means of launching the project for a union stockyards in the San Joaquin Valley.

Eight hundred goats were recently purchased in Mexico for the Widemann Goat ranch at Kings City. This company now has the largest flock of goats in the world. The milk will be handled at Kings City and condensed in such a form that it is expected will find a ready sale.

The quarantine order issued last September by State Veterinarian Keane under the authority of Gov. Johnson has been lifted on cattle from all states of the United States, with the exception of Illinois, beginning March 15. No cattle can enter California from the Republic of Mexico unless shipment is supervised by the State Veterinarian, nor from the State of Illinois unless shipper secures a permit from the State Veterinarian of California.

On March 19, Yuba City farmers held one of the largest rabbit drives in the history of the county.

[Subscribers wishing an immediate reply should send money order for $1.00. No charge for questions answered through this department. Name and address of subscriber must accompany each query.]

DO HOGS BECOME GOITERED?

To the Editor: Can a range hog get goitered? I have one that has an enlargement like a goitre on a man's neck.—C. W. F., Dos Rios.

[This can happen.]

FOXTAIL IN COW'S EYE.

To the Editor: One of my cows got a foxtail in her eye about four weeks ago. The ball broke and has run out, but I cannot get it to heal. The upper lid is swollen and very sore. Please advise me what to do. —G. E. H., Fresno

[Place a few drops of a 25 per cent solution argyrol in the eye several times a day.]

COWPOX

To the Editor: I have a cow with sore teats At first the teats looked red under the skin as if they had been bruised. Then there came large blisters filled with a a watery fluid which soon broke and great patches of the skin would slip off. Is this cowpox, and what shall I do for it?—L. A. R., Porterville.

[This is cowpox—a benign disease of cattle. Paint blisters with tincture of iodine once a day.]

MAY BE ABORTION.

To the Editor: I have a cow that took the bull about the middle of December and she showed no signs again till the middle of February, when she took the bull again. I saw no signs of abortion. If this is contagious abortion will the bull become diseased, and is there anything that could be used to keep the bull from carrying it to the other cows?—Subscriber, Corning.

[This may be contagious abortion. If so the bull will become affected and should have his sheath washed out daily with a 1-1000 solution potassium permanganate.]

RABBITS HAVE EAR SCAB MITES.

To the Editor: Can you tell me what is the cause of rabbits having sore ears? It starts first close to the head.—G. M., Ripon.

[This is the ear scab mite of rabbits. It can be cured by scrubbing thoroughly every day with a standard solution of lime-sulphur dip, used for dipping sheep.]

CALF TROUBLES.

To the Editor: At various times during the winter our fall calves suckling range cows in the feed yard have become affected with scours and sometimes it runs into the bloody flux, or at least they pass blood. How can this be prevented or treated? Also had three calves weaned about nine or ten months old that took suddenly sick and the symptoms resembled those of rabies. They were first noticed down or else acting stiff in limbs which would later cause fits like those of a poisoned animal and frothing at the mouth. One calf died after the third or fourth day, but the other two recovered and are all right now. Can you tell me what was the matter and how to cure them again?—E. E. C., Canby.

[The first mentioned calves had white scours. Use scour serum in 10 c.c. doses with hypodermic syringe as soon after birth as possible and you will prevent the trouble. The other calves had acute indigestion probably caused by bad hay. In cases of this kind give one-half to one pound doses of epsom salts, according to size, at daily intervals till there is some relief.]

PIGS HAVE NECROBACCILLOSIS.

To the Editor: A year ago last December we had a light form of infectious sore mouth break out among our little pigs. They were a little scabby over the face, but we lost but one pig. We did nothing for them as we did not know it was infectious. In July of last year we had about 75 pigs. We did not notice anything the matter with the first ones, but after a little it developed on them and then the little pigs seemed to be born with it. We managed to cure up about 40 of them with Lugol's solution and salicylic acid. We disinfected the pens then and again this spring just before the sows farrowed. The first pigs that were farrowed had very sore feet, but they were not affected in the mouth. In the later litters we noticed the affection a few days after birth. Some of these pigs were farrowed out in the field away from the house and they were affected just the same or even a little worse.

We want to know how to stamp this germ out of the herd so it will not reappear again. The way it has acted in our herd it is something that needs to be stopped before it appears in the little pigs. Any information along this line will be greatly appreciated.—J. C. H., Madera.

[This is necrobaccillosis and is producing both the sore mouths and feet. Disinfect your premises with a five per cent solution liquor cresolis compositus. This must be thorough and one application will probably not be enough. Touch up the sore mouths with a cotton swab dipped in the following: Camphor, 5 drams; carbolic acid 2 drams; mineral glycerine, 2 drams.]

Son of Segis Pontiac De Kol Burke

READY FOR SERVICE.

We are offering at a very low figure a splendid son of this coming young sire. Born March 6, 1915.

His dam has the following records:

Butter 7 days 26.41. Milk 605.5
Butter 1 year 755.40. Milk 20260.2

She is a daughter of Ignaro De Kol, ten of whose daughters have records above 20,000 pounds milk, including Aralia De Kol 28,090. Three nearest dams of this bull average 26.68 lbs. butter, 668.8 lbs. milk. Dam and sire's dam average 920.27 and 24,543 lbs. milk in yearly test. A full sister to his dam has produced 885 lbs. butter in one year.

Price and pedigree on request.

1st Prize 2-year-old Cal. State Fair 1914.
Segis Pontiac de Kol Burke.

HOLSTEINS

It isn't what you put into a Cream Separator—but what you get out of it that counts.

DE LAVAL
Cream Separators are by far the most economical

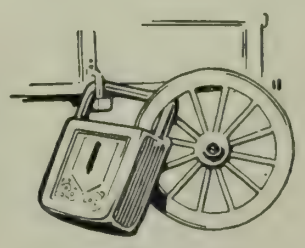
REAL economy is never short-sighted. It never confuses PRICE with VALUE.

PRICE is what you pay for an article—what you put into it.

VALUE depends upon the amount and quality of service the article gives you—what you get out of it.

You get by far the greatest VALUE for your money when you buy a De Laval—BECAUSE it will give you much better and longer SERVICE than any other separator.

From the standpoint of its greater durability alone the De Laval is the most economical separator to buy, and when you also take into consideration its cleaner skimming, easier running, greater capacity and less cost for repairs, the price of the "cheapest" machine on the market is most exorbitant compared with that of the De Laval.



And there is no reason why you should let its FIRST COST stand in the way either, because the De Laval may be purchased on such liberal terms that it will actually pay for itself out of its own savings.

A De Laval catalog to be had for the asking tells more fully why the De Laval is the most economical cream separator, or the nearest local De Laval agent will be glad to explain this and many other points of De Laval superiority. If you don't know the nearest local agent, simply write the nearest De Laval main office as below.

ALIFORNIA SHOULD GET MORE FROM SOIL.

(Contiued from page 389.)

rue conception of the scant supply f organic matter in our valley soils nd that the quick exhaustion of it y early cropping was the reason for uch decrease of cereal yield as he ad observed. His prescription for ure was horticulture — meaning hereby "gardening" and gardener's rts in organic manuring. He may ossibly have had the idea too that he fruit trees would make more eaf mold than they would consume nd thus act like forest trees—but is words are not clearly open to hat imputation of error.

Is it not clear then that, perhaps rom the very beginning of California griculture as established by Ameri ans, the lack of organic matter in nost of our soils has been recog ized; that practically no attention as been paid, until recently, to estoration and increase of this basis f soil activity and no proper esti nate is yet placed upon the funda nental method of growing more tock or more plants to use as ma ure or by buying commercial fer ilizers which convey animal wastes f a kind to meet soil wants? And ll these things are elementary fea ures of better farming.

Tilalge.—Soil-working is another essential requirement of greater uccess in moving the garden to the ield—which was Mr. Flint's con eption of the need of California early sixty years ago. We are earer to it now than ever before, for wo reasons:

First: The offices of tillage, as ex ounded theoretically and demon strated experimentally, are better understood than ever before, and nearly every reader of the intelligent California farm journal or farm book must now have a fair working understanding of the purposes and methods of tillage.

Second: The implements of tillage of all kinds are now much better than ever before, both in design and materials, and the motive power for them is so much increased and cheapened by tractors that the application of gardening standards of depth and thoroughness to field tillage is no longer a dream, as it was in Mr. Flint's time. We can now profitably realize his conception and it is another of the fundamental requirements of better farming.

Adequate Moisture.—It is also very widely understood by this generation that everything in farming goes by water, and without enough moisture every other good thing fails to come through. The mission fathers knew this, but did not draw correct conclusions from it. The American pioneers knew it, introduced surface tillage and placed too much dependence upon it. At the present day, the relations of deep tillage and sub-soil packing, rainfall and irrigation are made very clear. As the implements for tillage have advanced in style and efficiency, the agencies for irrigation have been multiplied and become readily available. Rainfall, surface flow and subterranean waters are all made cap-

NEW ENGLAND CALIFORNIA CORPORATION
RIPON, CALIF.

tive. Effort and investment for the use of each or of all of them, in individual operations is also a fundamental requirement of better farming.

Fertilization.—This essential of better farming has had a checkered career in California, from the day when the blind pioneer claimed that the California climate rendered manure useless, through the years when all the offal from our slaughtering establishments was being shipped to Hawaii to the later years when we have been importing considerable amounts of fertilizers from distant sources. Now trainloads of corral and stable cleanings go out from San Francisco, Los Angeles and other large towns to the fields, orchards and vineyards, and the handling of this material is a systematic business. Now also the fertilizer by-product of our abattoirs is skillfully handled and rendered available, as our advertising pages continually show. And the same is true of mineral phosphates, nitrates, sulphates, hydrates and the like—everything which will help a plant to grow can now be purchased to advantage in our markets. But this must be clearly understood: the use of fertilizers is not a cure or substitute for poor farming. Many a man has bought a little jag of fertilizer, hoping thereby to check the decreasing yield from his land. Sometimes the season is extra-favorable and he gets surprising results, but generally he "fails to see that fertilizer did his land any good," after such an experiment. Honest fertilizer is the sheet-anchor of the best farming, not the safety-clutch of poor farming. The nearest ideal your tillage, moisture supply, plant vigor, etc., are the more you can profitably spend for honest fertilizers. This is a fact which is not yet widely recognized in California, but it is coming to the light in which all men may see it.

Rotation.—During the last decade most commendable progress has been made in understanding the mutually promotive relations which different classes of crop plants may sustain toward each other and the relation of pasturage to all of them. These things are as old as agriculture, but their California bearings are only dawning. After you have done all that you can for soil condition, tillage, moisture supply and fertilization, the rotation of crops arrives to applaud your efforts, to help you gather and hang about your neck the garlands which preceding noble acts have won for you. And out of the capability of California for diversity in plant gorwth there will in time arise a breadth in rotation unsurpassed elsewhere in the world, probably. The present limitations upon it are not agricultural but economic, and they will lighten as western population increases and trade-routes to and from our ports extend and multiply. This is the pot of gold buried in our soil, from above which the rainbow of better farming for California arises.

In Conclusion.—In this hasty sketch of a subject of surpassing breadth and baffling diversity, we have tried to emphasize a few suggestions for the reader's own thought and inquiry, viz.:

First: it is essential to believe that California soils are still intrinsically good and capable—therefore they invite effort and investment for improvement.

Second: the exhortation to better farming in California is emphasized because it is only through better farming that investment in better tillage implements, better power machines for labor-saving in farming operations, better plants and better fertilization, can attain the fullest results and become most reasonable. Each of these avenues of improvement is beautiful and admirable in itself, but affords no through line to greater prosperity unless all the connecting avenues are also open.

Poultry for Profit---Producing and Marketing.

RAISING BROILERS FOR THE MARKET.

[Written for Pacific Rural Press by Mrs. Susan Swaysgood, Pomona.]

During the last few weeks we have told you what can be done with a flock of hens on the small farm or orchard that is near enough to market for egg-production.

Possibly a good number of our readers are a little too far out to ship eggs during hot weather and do not know just how to make a profit on their flock of hens.

To all who are so located I would say, get an incubator about the size that will use up your eggs while they are fresh, or better, get two incubators of smaller capacity and set one every ten or twelve days. You can make a couple of brooders yourself, and if you keep the hens busy laying eggs you will find that you can make more money by turning your eggs into broilers and selling them from one to two pounds each than in shipping eggs to market.

At this writing, March 15, broilers are bringing forty-five cents a pound in San Francisco. Now there is more money in broilers at twenty cents a pound than in eggs at twenty cents a dozen. You can ship broilers quite a distance by putting water cans and a little feed in each coop. They will lose a little in weight during the journey so that you must not expect to get paid for every pound you put into the coops, but the express is not high and they will travel a long way in one day.

Feed Milk.—If you have milk feed them all they will drink and after they have made a month's growth give more fattening food than anything else. This with milk will make them soft and tender and the breasts will be plump.

If the chicks are fed milk from the start they will grow good bone and less food will be required to fatten them later, provided they are of one of the larger breeds.

There is always such a quantity of small Leghorn broilers on the market during the summer months that it would hardly pay to hatch that kind with a view of turning them into broilers. But any of the heavy breeds will make good broilers and there is always a market and a good market for broilers of the right kind.

Incubators are so cheap now that they can be made to pay for themselves out of one or two good hatches, then they are there to use any time you need them.

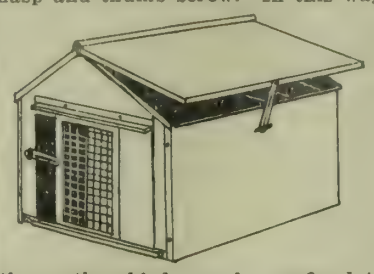
As the law now stands in regard to storage eggs, dealers can't store yet for some time, and prices will not be much better till storing begins for the season and brown eggs will have to be sold at a disadvantage unless they are incubated.

Soft Roasters.—Another good way, and perhaps for some it might prove the best way, is to turn them into soft roasters. A broiler is a bird weighing from one to two pounds; a fryer weighs from two to three pounds, and a soft roaster from five to six pounds.

But the one thing to bear in mind is this: the growth must be rapid to make the very best kind of either broiler, fryer or roaster. These are the quality birds that bring the price. You can't let the chicks string along four or five months and not grow enough so you can see it. They must make quick growth and be sold while the breast bone is soft.

That, together with a nice plump lot of meat on it, makes the soft roaster, and by proper feed, warmth and right management, chicks of the large breeds can be sold as soft roasters at four to five months old.

Milk-fed soft roasters should bring at least 20 cents a pound and will often bring more, but I prefer to figure low enough. If hatched in the spring they can be sold before the fall work begins and long enough before the market is supplied with turkeys to run the price down.



In these days of quick transit the man who is back a few miles need not let that trouble him or prevent him from making money on anything he raises in the way of poultry. All he needs to do is to produce the quality; he will find a good sale for it.

CHICK AND GAME COOP.

[By Geo. H. Croley.]

The increasing interest in the domestic breeding of game birds has created a demand for convenient labor-saving appliances with which to handle them. These birds are often bred in isolated spots, canyons, or wildwood where they are exposed to natural enemies while they are young and helpless.

The accompanying illustration represents a galvanized iron coop measuring in width, 18 inches; in length, 24 inches; and in height, 17 inches. It is practical, convenient, and is sold at a low price by poultry supply dealers generally. During cold or mild weather it is well ventilated by the openings at the back end while the top and front are closed. It has two metal doors in front. One is of wire and the other is a solid sheet of metal. The wire door can be completely closed or locked partially open by means of the long hasp and thumb screw. In this way

the mother bird may be confined to the house while the young can run at large or into a wire enclosure placed in front of the coop. The hasp and thumb screw attached to the side holds one side of the roof partially open in hot weather or tightly locks the roof when closed.

These metal coops are extensively used in the eastern states for rearing baby chicks and game birds, but in California there seems to be a mistaken notion in regard to their value. It has been considered that they are not suited to warm climates. They are as cool as a similar brood coop made of any other material when properly handled; no coop for young fowls should be exposed to the direct sunshine in hot weather, but must be protected by shade; and proper floor covering and nesting material should be provided in a brood coop of any kind.

Some of the advantages to be gained by the use of metal are these: The coop is rat, cat, and skunk proof; mites cannot live in a metal house; it is rain-proof and does not absorb moisture; it is easily cleaned and perfectly sanitary.

Profit and Pleasure in Game Farming

YOU do not need to be told that there is a great demand for game birds in this country—a demand much larger than the supply. You probably know that game birds of many kinds bring high prices in city markets. But has it ever occurred to you that, by means of game farming, *you* can help supply, and profit from, this demand?

You are well equipped to raise game birds for the market, for your table, and for sport. You have the necessary land. You and your family have the experience gained in raising stock and poultry. You may conduct a game farm on either a small or a large scale, as conditions and your own inclinations warrant. The expense involved in time and money is not great in either case, while with reasonable care, success is almost certain to follow.

Proved by Experience

The experience of others verifies this statement; for while game farming has not been carried on as extensively in this country as in Europe, we have many well conducted and profitable farms in all parts of the United States. The owners of these game farms not only receive good prices for eggs and for birds but some of them also rent the shooting privileges on their land to those who are very willing to pay for the sport

For your information on this important subject we have prepared a book called "Game Farming for Profit and Pleasure." It gives detailed information regarding the raising of game birds, their habits, foods, etc. You will find it well worth reading.

Write today for a free copy of this book. Use the coupon below.

FAT HENS DROP DEAD.

To the Editor: During the past two weeks we have lost about 15 hens out of a flock of 400 two-year-old White Leghorns that are laying about 50 per cent. Excepting two or three they seemed perfectly healthy; combs red, appetite good—they just drop dead; some of them while eating. They are fed the same as our year-old hens that are not thus affected. Post-mortem shows no unnatural conditions except considerable blood around the heart. How can we prevent white diarrhoea among little chicks?—Subscriber, Elverta.

[Answered by Geo. H. Croley.]

[Apoplexy or fatty degeneration of the heart killed the older hens. Reduce the barley and increase meat scrap. If near a source of infection it is almost impossible to prevent white diarrhoea. Feeding sour milk sometimes seems to help; thoroughly disinfect incubators and brooders; some hens are the germ carriers and infect the egg before laying it—remove these hens from the flock if they can be discovered.]

POULTRY NEWS NOTES.

[By Geo. H. Croley.]

The State Poultry Association will hold its second annual show at Modesto, December 6 to 9 inclusive.

The poultry show in connection with the Butte County Spring Exposition will be judged by C. G. Hinds.

Farm women are being urged in the Southern States to form egg-selling associations, the object being to secure better prices.

Tulare is shipping 3000 cases of eggs a month. During February, the daily income of the poultrymen, at that point, was about $600.

The poultry business at Livermore is steadily increasing. During the first week in March, the Verde Poultry Farm marketed 480 dozen eggs.

Southern San Joaquin county farmers have organized a big rabbit drive to take place on March 26, in order to save their growing crops from further damage.

A. C. Lillard reports that G. B. Glass of Manteca is utilizing with profit the parcel post for shipment of eggs to a number of customers in the Bay section to whom he regularly mails cartons of fresh eggs.

The Tulare Rochdale Company recently shipped a car containing over 400 cases of eggs or more than 12,000 dozen. This is said to be the first full carload of eggs to leave that point.

The breeders of Standard varieties of fowls, located in and about Oxnard, are preparing to raise more chicks than in former years. Barred Plymouth Rocks and White Leghorns seem to be the most extensively bred varieties, but Black Minorcas and Black and White Orpingtons are also very popular and gaining in numbers.

Poultry Breeders Directory

Rates in this directory, 3c per word each issue; or if carried weekly for one year, 2½c per word.

2000 WHITE LEGHORN PULLETS, 3 months old. Price according to quality. All kinds of breeding and laying hens, roosters and pullets. Petaluma incubators, new and used. Baby chicks of Brahmas, Orpingtons, Anconas, White and Barred Rocks, Rhode Island Reds, Black Minorcas, Buff, White and Brown Leghorns. Best quality. Prices reasonable. Immediate deliveries. Brown's Poultry Yards, 2550 San Pablo Ave., Oakland. Cal. Closed Sundays.

MACFARLANE STRAIN WHITE LEGHORN eggs, $1.50 per 15, $2.50 per 20, $5.00 per 100; chicks Dec., Jan., Feb., 12c each, afterward 10c. Order now, any quantity. Cockerels, $2.50. Big plant, low prices, stock better than ever. Catalogue free, correspondence solicited. Newton Poultry Farm, Dept. 1, Los Gatos, Calif.

WYANDOTTES—Beautiful, useful and profitable. Best for showing; best for egg-laying; best for table. Largest Wyandotte Farm in the Southwest and the only complete family of Wyandottes known. Eleven varieties and each from the finest strain bred in the United States. Hatching eggs and baby chicks reasonable. Write us for full particulars. VILLA WYANDOTTE FARM, Villa Road, Lamanda Park, Cal.

LIVABLE BABY CHICKS—We are supplied by reliable Breeders and experienced hatchers. Better chicks cannot be had from any source. All varieties, any number. High quality birds, bargain prices, breeders, laying hens, pullets. Free exhibit. Everything in Poultry, Pigeons, Rabbits, Dogs, Cats, Canaries, Pets. Give us a call or write. Fanciers' Exchange, 642 S. Main St., Los Angeles, Cal.

MAKE BIG MONEY with our White Orpingtons. Best breed for every need. Lay most when prices highest; make finest eating; return greatest profit. 1000 grand range-raised birds, trap-nested and bred for heavy laying. Eggs, chicks, stock. Prices reasonable. Catalog free. Whitten Ranch, R. D. 5, Box 647, Los Angeles.

MODEL POULTRY FARM White Leghorn Specialists. We are now booking orders for Hatching Eggs. Baby Chicks and 10 weeks' old pullets for delivery after January 1st, 1916. Prices on application. Twelve years of breeding have made our Leghorns the desired Heavy Winter Layers. W. C. Smith, Prop., Corning, Cal.

OUR APRIL AND MAY HATCHED White Leghorn chicks will make good layers in the Fall when eggs are high. Our breeders averaged 171.2 eggs in 1915, flock of 635. Large percentage winter eggs. Chicks, $10.00 per hundred. Order at once. Brooke Farm, Rancho Del Paso, Sacramento, Cal. Office 807 J St.

WELL HATCHED AND STRONG day-old chicks from healthy vrigorous breeders. White and Brown Leghorns per 100, February $11, March $10, April $9. Reduction in quantities. Let us send you our announcement. San Jose Hatchery, 373 Meridian Road, San Jose, Cal. Chicks well hatched are half-raised.

MRS. BEST'S LETTER.

Dear Friends: With Easter only about a month away, we are all very much interested in what we shall have for spring hats.

From the display, there is a hat for every face and every pocketbook. The prevailing colors in the general utility hats are purple, dark brown and black. Purple is enjoying quite a reign and is being used for hats for all ages and is as much worn by girls as older women.

The small, high-crowned, drooping shapes are very popular and deservedly so, for they give the head a neat appearance and can be fastened on very securely with a veil. Many of these are trimmed in high, upstanding ribbon bows of either harmonious or contrasting color and a bunch of small flowers.

Another attractive model is the semi-poke bonnet effect—down on the sides and up in the back. These hats are trimmed flat with velvet ribbon and the turned-up back is covered with flowers. Some of these hats have ribbon ties that add to the quaint effect.

Last, but not least, either in size or popularity, are the sailors. The new sailor has the rolled brim and is of fine straw and is trimmed to suit the taste of the wearer and the purpose for which it is bought. The plainer ones have a simple ribbon ornament or a fancy straw braid around the crown or narrow picot edge ribbon running across the crown in various designs. While the very same shape may be faced with satin and have a wreath of roses and leaves running around the crown or a fancy feather ornament on the side, making a much more dressy and also more expensive hat.

The dress hats are made of silk crepe and maline and there are beautifully colored flowers used in the trimming, but not so much ribbon.

There is talk of its being a white season for hats and those that are being shown now are of hemp or fine horse-hair braid, faced with colored silk and trimmed with flowers and leaves and velvet ribbon.

There are almost no ostrich feathers being seen, either in the shops or on the streets, but some of the walking shapes are trimmed in quills.

Veils are a good deal in evidence —those with borders hanging straight from the hat almost to the shoulders, while others of open mesh are fastened snugly around the face.

If a veil is to be worn for several hours, it should be of thin, open mesh, without dots or heavy figures, as it will be much less tiring to the eyes. —Rosabella Best.

A POOR CHICKEN.

A well-known professor has a bright little boy, who one day appeared in his father's study clasping a forlorn little chicken. "Willie," said the father, "take that chicken back to its mother." "Ain't dot any modder," answered Willie. "Well, then, take it back to its father," said the professor, determined to maintain parental authority. "Ain't dot any fader," said the child. "Ain't dot anything but an old lamp."

LEMON PIE.

FOR the crust, use 1½ cups flour and ½ cup butter or a trifle less of lard, 3 tablespoons of water, a pinch of salt and also of baking powder. Sift flour with powder and salt; cut in lard with a knife, add the water and handle lightly. This should make two shells and you will find the shells better shape if you invert a pie tin and fit the pie crust over it. Slip the inverted tin into the oven and bake. The filling is most delicious and is composed of 4 eggs, 1 cup sugar, 1 lemon. Beat yolks and one white very light with the sugar, add juice of lemon and cook in double boiler. When well thickened, stir in the well-beaten whites of three eggs. Put into the crust and brown a trifle in the oven.

PORCH FURNISHINGS.

Those of you who live in the warm valleys can have pleasure out of your porches that cannot be enjoyed by the dwellers on the coast. But to get the fullest enjoyment you should have your porches ready for use by the time the warm weather is here. Awnings of striped material are an ornament as well as a protection from the too ardent rays of the sun, and a grass rug, which does not fade nor show soil would be good for the floor.

There should be seats of some description ready for occupancy, there being nothing prettier than the willow in a soft gray green, with chintz cushions. But if this is not practical from a financial standpoint, there could be benches built along the walls and small grass mats (which are very inexpensive) used for seats on the steps.

Hanging baskets are very pretty and a great addition to any porch. They can be of sprengeri, or even of wandering Jew. You will find them much easier to keep growing well if you have a pan fastened on the bottom of the basket in which water can be kept. Otherwise, they require lifting down to water and that seems such a burden. If these pans are painted green, you hardly notice them at all.

Children always enjoy a hammock and the pretty coloring adds to the attractiveness of the porch. The whole idea of furnishing a porch is to add to the comfort of the family and make it a pleasant place where any member of the household can drop down and rest in the open air.

SHINE THE SILVER.

Cleaning silver in the old-fashioned way by rubbing every part of the surface with silver polish is a very arduous task. The new "Silver Clean" pans have changed all that. These pans are made of zinc with a wire tray in the bottom on which to place your silver. After you have put in all the silver you desire to clean, you fill the pan with hot water to which you have added salt and common baking soda.

A few moments suffices to clean the silver and you have no work in the matter but to take out and dry. If silver is badly discolored, it may require a second bath. This is entirely harmless to all ordinary ware, but must not be used on oxidized silver.

These pans can be purchased at any good grocery or hardware stores and are not expensive.

HOME HAT TRIMMING.

Dear Nan: If you are industrious at all this spring, why don't you make yourself a hat or make over an old one? I have just finished remodeling several old hats and they look very nice. If you have a rusty-looking black straw or burnt white one, buy some hat blacking. I did hear one of the girls say that she used liquid shoe polish, but I bought a preparation called "Blak-it." Apply this to your old hat and when it dries, it will look just like a new one. The Blak-it gives a body to the straw and a nice sheen to it too, which makes it look like new. If it is a sailor shape, you can put flowers, ribbon or quills on it, anything that looks fresh and nobby and you will have a hat to be proud of at very little expense.

Don't black your old panama though, but have it cleaned and reblocked. Mine looked almost as well as it did when I bought it with it made into a new shape and retrimmed. Put on a ribbon band with a small flat bow at the side, or loosely tie in a knot a ribbon about two inches wide of the same color as your sweater, or (very fashionable) of your stockings if you wear gay ones with your white clothes.

You can make a very pretty hat for dressy occasions, or to wear with a suit, by covering an old becoming shape with taffeta. Of course, you can buy canvas shapes all ready to cover, but a hat to be pretty on you must be becoming, so choose a shape that you know suits your face and then pull the taffeta snugly over the frame and catch it neatly. A crown of rows of shirring would be pretty with a plain brim, trimmed very simply, just a single rose or ornament of some sort. Hats to be smart must not be overtrimmed; let the materials show the niceness of your hat.

I hope you will try some of these suggestions. You will feel so proud to be able to fix up your own things and you can have twice as many of them, at the same expense, if you can make them yourself.

Wishing you great success, devotedly, Betty.

For those people whose skins are very tender, or who have luxurious tastes, there are scented bath tablets of soap of various odors—geranium, almond, violet and mint. They are good-sized cakes and not too expensive, selling three for a quarter, but, of course, they are not expected to take the place of a good reliable white soap for ordinary usage.

THE ROSE.

Authorities agree that March or early April is as late as it is safe to plant roses for summer blooming. They should be planted in good, heavy soil well mixed with good, old stable manure.

After the rose bush has been placed in the hole prepared for it, fill in with soil until about three-quarters full and then add water to settle the soil around the roots, before the hole is entirely filled. Good, two-year-old bushes should produce an abundance of bloom the first season as early as May or June and if all old blossoms are kept cut off and the plant watered well, their blooming can be prolonged into December.

The best way to water is to dig a trench around your bushes and fill with water, afterwards covering with dry earth. This keeps the moisture where it should be—at the roots. Do not do surface watering unless you wish to spray to remove the dust.

The insect pests of the rose are not numerous and in most cases can be controlled. Aphis is the most serious and if left unmolested will take the life and vigor from any plant. The remedy is spraying with a nicotine solution. Mildew is a whitish looking mould that covers some roses so completely as to spoil all their beauty and retard their growth. It is due apparently to atmospheric changes, such as warm days followed by cold nights. A dusting with sulphur in the morning before the disease appears is a good preventive.

There is also a rose slug that does some damage, but it is not a serious pest.

The following list of twelve rose bushes were suggested by a florist as being among the most satisfactory for the average yard: Lamarque, Papa Gontier, Juliet, Cecile Bruner, Pink Cochet, Caroline Testout, Frau Karl Druschki, Gen. McArthur, Mrs. A. Waddell, Harry Kirk, Ulrich Bruner, Beaute de Lyon and Madeline Soupert.

For recipes where care in measuring is necessary, a set of measuring spoons is valuable. These spoons hold respectively, 1 teaspoon, ½ teaspoon and ¼ teaspoon and can be bought in the set for fifteen cents.

PROTECT THE CHILDREN.

Whenever the patient with tuberculosis is a member of a household, the condition of the physical health of each member should be determined, and improved as much as possible.

The only way to eradicate tuberculosis is to have those people who come in contact with it in such a vigorous state that they can resist it.

After a death from this disease in a home, walls and woodwork should be freshened and the place fumigated in addition to the washing of all bedding.

A sojourn in a sanitarium of a tubercular patient for a few weeks is of great value not only to the patient himself, but to the community, for the discipline learned there teaches how to avoid being a menace to health.

THE SUNRISE NEVER FAILED US YET.

Upon the sadness of the sea
The sunset broods regretfully;
From the far, lonely places, slow
Withdraws the wistful afterglow.

So out of life the splendor dies;
So darken all the happy skies;
So gathers twilight cold and stern;
But overhead the planets burn.

And up the east another day
Shall chase the bitter dark away;
What though our eyes with tears be wet?
The sunrise never failed us yet.

The blush of dawn may yet restore
Our light and hope and joy once more.
Sad soul, take comfort, nor forget
That sunrise never failed us yet.

THE CHOCOLATE BUSH.

"Chocolates don't grow on every bush!" teased father, slipping out of four pairs of hands that clung like burrs to his coat and his collar and his furry fingers. The children always pounced on him for a kiss when they saw him go whisking out of the door and trying to catch the car for the office.

"Wouldn't it be fun if they did!" giggled Marion, curling up in a corner of the sofa when he had got away from them. "Like huckleberry bushes, you know! My wouldn't I like to 'go berrying'!"

"Wish't I could!" said Connie. "We could make-believe a tree if we wanted to—an April-Fool tree. Let's do it to-night—to father!"

Every year when April-Fool's Day came around they always had had some funny joke "on" father. Sometimes the joke was the other way, for mother helped them, and mother was the best fun in the world to help you think up little jokes that couldn't hurt anybody.

"Mother would help us—let's ask her!" cried the other children. "We could get a bush and fix it up with paper chocolates the way we made the paper oranges, you know, and tied them on. Mother can show us."

"I think it would be great fun," said mother. "You two boys go and find your bush—a good scraggly one, with lots of sharp twigs and thorny tips all over it. I'll show you why when you bring it."

"And what can we do, mother?"

"Why, up in the garret, Connie, is a great heap of brown tissue-paper, in behind the big trunk where the boxes are. You can get some of that and take it down into the kitchen, and get Myra to let you smooth it out with a warm flatiron. On the shelf in my closet, Marion, you will find some bits of jeweller's cotton, all colors. Here is some paste (or a drop of mucilage is just as good) to finish the chocolates with, and when you come back I'll help you make a fine supper-table ornament."

"Don't they look just e-zactly like the candy ones?" admired Connie, as the soft brown balls grew under their fingers. Each one was stuffed tightly with cotton till the thin brown outside was plump and smooth and looked good enough to eat. A drop of paste on the under side made it nice and firm, with no edges showing. On some of them mother stuck a little snip of red paper to look like a bit of candied cherry. Others were topped with a piece of broken walnut.

It did not take long to make them, and then there was the fun of sticking them on the tree. First, mother made a place in the middle of the table for the big green jardiniere, and filled it with nice white sand and stuck the bush in it. Next, they carefully pushed a paper "chocolate" on to every sharp little twig and thorn, till the scraggly thing looked as if it had blossomed out with big brown berries. It was a beautiful bush, and almost made the children's mouths water.

"If it was only a really-and-truly!" sighed Connie.

"Then there wouldn't be any April Fool to it!" returned Marion. "And it's April-Fool Day, and somebody always has to be."

It must have been overhearing this that made mother think of turning the joke on them. A few minutes after, when they were busy over a game, she went to the telephone. All I can give you is what she said at her end of the line, but perhaps you can guess what the other person said, or part of it.

"You—papa?"

"You're going to be dreadfully April-fooled tonight!"

"You know what you said when you went away—about chocolates growing on bushes?"

"Well, they've made a bush! Paper chocolates—stuffed with cotton. Understand?"

"Um-huh! That would be fine. A pound would do nicely. Could you take off the paper ones and change them for real ones in ten or fifteen minutes? All right, I'll get them singing round the piano or something. Come home early."

Now you can guess, can't you? That was just what happened. When they were called out to supper, the candles were lighted and the children all stood with shining eyes to see how father would look when he saw the chocolate bush, and especially how he would look when he tasted one of the chocolates.

"You see they do grow on some bushes!" teased Marion.

"I see!" said father. "First time I ever saw such a bush in my life! Are they good to eat?"

"Just try one!" screamed the children.

"Fine!" said father, trying one, obediently. "Have one yourself," he urged politely, reaching one to Marion. "No?" as she drew back. "Why, they aren't all for me, are they? This is delicious!"

The children began to look doubtful. He didn't seem to mind the cotton a bit, but kept on tasting. Mother looked on with twinkling eyes, but said nothing. Suddenly, the boys slyly reached out a hand and helped themselves to one apiece.

"They're real!" "They're real!" they cried out both together. "It's father fooling us! He's changed the paper chocolates for real ones!"

GRAND PRIZE

In awarding the grand prize to Ghirardelli's Ground Chocolate, the Panama-Pacific International Exposition confirmed a popular verdict. Ever since its introduction in the early seventies this appealing, health-sustaining beverage

Ghirardelli's Ground Chocolate

has stood supreme in the homes of the West.

It is most convenient in form and economical in use. It comes to you in an hermetically sealed can that safeguards its native purity and delicious flavor. Order a can from your grocer today.

In ½-lb., 1-lb. and 3-lb. hermetically sealed cans. There's a double economy in buying the 3-lb. can.

Buying has been decidedly of a hand-to-mouth order, with an uncertain feeling as to the future, but with moderate supplies holders are forcing sales and values show no quotable change.

Shipping, ctl	$1.40 @1.42½
Choice Feed, ctl	1.35 @1.37½

OATS.

While oats are in fair supply, and with no large demand, there is an easier feeling, though the old range of values still stands. There is a fair demand for red feed, but the movement is not heavy.

Red Feed	$1.35@1.37½
Red Seed	1.45@1.65
White	1.50@1.55

CORN.

Eastern corn is fairly steady, and good California yellow is salable at about the same figures. Desirable lots of Egyptian, etc., are also moved without difficulty, but there is plenty of poor stock that will not pring the prices quoted.

Eastern Yellow, ctl	$1.80@1.85
Milo Maize	1.40@1.45
Kaffir	1.60@1.65
Egyptian	1.50@1.55

BEANS.

There is still nothing of much interest to report. Again there is only one change, and that downward, horse beans being lower. Other descriptions receive very little attention here, and reports of some large sales in the country are not borne out by statements of local dealers, who say there has been no demand of any consequence for over two months. A reviving demand, however, is expected before long, and there is no disposition to force sales at the expense of prices.

(On wharf, San Francisco.)

Bayos, per ctl	$4.60@4.70
Blackeyes	3.20@3.30
Cranberry Beans	4.75@4.85
Horse Beans	3.00@3.25

Red Kidney	6.50@6.75
Mexican Reds	4.50@4.65
Tepary Beans	4.00

SEEDS.

Alfalfa still receives considerable attention, but the demand is beginning to decrease, and other lines quoted are quiet. Values stand about as before.

Melilotus Alba, lb.	23 c
Melilotus Indica	6 c
Bur Clover	11 c
Oregon Vetch	5 c
Soy Beans	6 c
Canada Peas	5¼ @ 6 c
Alfalfa, per lb.	22 @24 c
Sudan Grass	40 c

HAY.

Hay is still coming into this market more freely than is warranted by the demand, which is by no means heavy. As a result, the daily arrivals have been rather slow to clean up, and in some cases prices have been shaded, though not enough to warrant a change in quotations. There is still a good demand from some interior points, which helps materially in maintaining prices. Offerings are mainly of medium and poor grades, fancy hay being very scarce, and bringing even better prices in the south than here. Some export business is reported, but nothing important. Arrivals of alfalfa are light, but with a new crop in sight prices are easier.

No. 1 Wheat	$13.00@16.50
No. 2	12.00@14.50
Tame Oats	12.00@18.00
Wild Oats	12.00@14.00
Alfalfa	14.00@17.00
Stock Hay	10.00@12.00
Straw, per bale	25@ .40

FEEDSTUFFS.

Some of the staple lines, such as **bran, middlings, etc., continue in** fair demand, and alfalfa meal holds its own pretty well, but in general the call for feedstuffs has fallen off greatly in the last few weeks, owing to the rapid growth of green feed. Values are steadily held.

(Wholesale prices per ton, carload lots, San Francisco.)

Beet pulp, per ton	$22.50@23.50
Alfalfa Meal, per ton	20.00@21.00
Alfalfa Molasses Meal per ton	21.00@22.00
Bran, per ton	26.50@27.50
Oil Cake	Nominal

Middlings	33.00@34.00
Rolled Barley	29.00@30.00
Tankage	45.00
Rolled Oats	29.50@31.00

VEGETABLES.

Many lines of vegetables continue to decline, with rapidly increasing offerings of local stock. Some Florida peppers, eggplant, etc., are still appearing, but the prices are lower; and Mexican tomatoes also show a sharp decline. The principal feature is the extremely heavy supply of asparagus, of which over 6,000 boxes arrived Tuesday, and prices are accordingly dropping. Rhubarb also is much lower, with a large supply of fine stock, and hold-over lots are hard to sell. Peas and string beans are going down steadily, and celery is considerably lower, with larger offerings than can be sold.

Cabbage, ctl	50@60 c
Cauliflower, doz	50@60 c

DECIDUOUS FRUITS.

Interest has been added to this department by the appearance of strawberries, which have been out of the market for an unusually long period and are well received. The shipments come from Imperial, and the first lot sold up to $3.50 per crate, declining since, with larger offerings. Shipments from other districts are expected before long. Apples show no quotable change, and the current demand is inactive.

Strawberries, S'n, crate $2.00@2.50

Apples:

Pearmain	.85@1.25
Baldwin	.75@1.25
Oregon Spitzenbergs	1.50@2.50
Jonathan	1.25@1.75

DRIED FRUITS.

Conditions in the dried fruit trade show no very important change as yet, everything being so unsettled that ideas as to values are little more than guesswork. There is no desire to buy in any quarter, and it looks as if it might be a long waiting game, with conditions very much to the disadvantage of such growers as do not stand firmly together, as many buyers will use the situation to drive close bargains. Prunes appear to be the item of most interest at present. Some packers report making purchases in the country as low as 3½c, or even 3¼c; and are not at all disposed to pay more, though many growers are still holding their prunes considerably higher. With co-operation, it would certainly seem as if the growers should be able to clean up the little that remains at better figures, as stocks in consuming markets are light. Apples also are lower, with some surplus reported both here and in the East; and apricots have been marked down a little, though they are too scarce to cut much figure. Calimyrna figs are higher, with imported stock cleaned up; while black figs are hardly so firm. The raisin market is steady, and there is no apparent anxiety over the English embargo. The New York Journal of Commerce says:

"The depressing influence of the British embargo appears to be too much for some of the Coast packers to withstand and prices are again lower for 1915 crop California prunes. The tone is easier than for some time.

"Prices for stocks of 40s to 60s, inclusive, 1915 crop Santa Clara prunes, declined to a flat 4c bulk

BUTTER SHIPMENTS TO THE EAST.

WAR conditions, apparently, are boosting local butter prices. England has not been getting much from the usual European sources, and for some time there has been little for Australia, with the result that heavy buying has been done in New York. Eastern storage stocks are said to be closely cleaned up, and production there is not sufficient to meet both local and export needs, resulting in high prices which are attracting California butter east in liberal quantities, ten or more cars having been shipped recently. The New York price has been running up to 39c, and Chicago to 36c; and a difference of 5c at the time of arrival is said to afford a profit to the shipper. However, these long-distance shipments are considered quite risky, as the necessary time for transit may bring a flood of stock from nearer points, and unprofitable prices when the goods arrive.

Special Live Stock Market Report.

Finished cattle are still scarce and prices have advanced slightly. Packers are probably pretty well supplied, however, till grass cattle come in about the middle of April.

Spring lambs are now coming in fairly well, but prices will probably continue high. Prime wethers are quoted slightly higher.

While the eastern hog market dropped about 35 cents per cwt. from the highest point, quotations remain unchanged. There is still a scarcity of heavy hogs and prices for this class are not likely to go lower at this time.

WOOL.

The wool market is still a waiting one. There is practically no buying activity. There is reported a tendency among eastern wool owners to shade prices in order to move stocks on hand. The London market closed weak with clear wool off 5 per cent and defective seedy and short wool off 20 per cent.

The TRACTOR of General Utility

Knapp & Black, Gen'l Ag'ts Bullock Creeping Grip Tractor
157-59 N. Los Angeles Street, Los Angeles, Cal.

basis f. o. b. common Coast shipping points for immediate shipment, and even with this concession made on the part of the packers, buyers show little interest.

"Future 1916 crop prunes have been influenced to an even greater degree than 1915 supplies."

CITRUS FRUITS.

The eastern citrus auctions are paying fair prices only for oranges and lemons, though the demand seems to be stronger than for some weeks past. At New York on Monday, March 21st, oranges averaged from $1.70 to $3 per box and lemons brought $1.75 to $2.10. The same day at Chicago oranges averaged at auction from $2.25 to $3 and lemons from $2.25 to $3 per box. Shipments from southern California this season are 1,000 cars less than same date last year and 2,000 cars two years ago, which means there are lots of oranges to go east during the next few weeks.

Oranges have been arriving in the San Francisco market very freely for the last fortnight, and a good many dealers are looking for a drop in prices, with the result that local business is very quiet, though no quotable decline has yet been made.

(Wholesale prices, San Francisco.)

Oranges, Navels	$1.75 @ 2.75
Tangerines	1.50 @ 2.00
Grapefruit	1.25 @ 2.50
Lemons, box	1.75 @ 3.25
Lemonettes, box	1.25 @ 1.75

HONEY.

The local honey market remains quite firm, supplies being light and the consuming demand normally active, and apparently there is little desirable stock available in the country. Of course no large shipments would be welcomed here, as there is no large outside demand and local needs are not heavy. Conditions of late have been favorable for a good crop in some districts, but it is too early to get definite information as to the probable output.

HORSES.

A good many wagon horses that have been used on local delivery or teaming work are still being offered, and those that appear to be good value find fairly ready sale. Heavier stock has come in more freely this week, including good-sized assortments of chunks and drafters both from Nevada and northern California, as well as a good-sized lot of mules. The heavier stock has been cleaning up readily at full values, and well-formed, gentle-broke horses of medium weight are sold without difficulty, though the general run of light stock finds no demand here.

(Approximate values in San Francisco, based on auction sales.)

Drafters, 1700 lbs and up	$250 @ 300
Drafters, 1550 to 1650	150 @ 225

Publisher's Department

The gain in new subscribers during the past week was 199, one less than the mark we had hoped to pass. Better luck, boys, next week.

Occasionally our book department receives a request to send a book on approval. This we can not do, though we dislike turning down the request. The books we publish are for sale by practically all book stores and may be examined there before purchased. We are always ready to fill book orders, providing a check comes along.

The Killefer Mfg. Co., Los Angeles, announce as the winner of the prize given by them during the recent Orange Show at San Bernardino, C. A. Stone, foreman of the Fontana Ranch Co., Fontana, Cal. The prize was a La Verne Rotary Cultivator, manufactured by Killefer Co.

THE WEST JERSEY SALE.

The Jersey breeders of the Northwest are to have an opportunity on April 6 to secure at their own price one of the best herds of Jerseys that has ever been offered to the public in this or any other country. At this time, H. West, of Scappoose, Ore., breeder and importer of Jersey cattle, will offer at public auction fifty-one head of the choice specimens of his large herd, all of which are imported or are the progeny of imported dams and sires.

For a number of years there have been those who contended that if you have a beautiful herd of prize winning Jerseys, you have them at the sacrifice of the "pail and churn," and still others who argue that production is the real test of the worth of an animal, and that production can only be obtained at the expense of beauty. Mr. West adopted as his slogan, "Beauty and Utility," believing that these two characteristics could be combined in one individual, and that a herd of this kind is the most satisfactory of all. The result of this policy has been to develop one of the highest producing herds in the Northwest, and to use his own expression, "the herd will produce an average test of 6 per cent butterfat."

Surely beauty and utility have come into their own. These animals are offered you at your own price. Go out and get them. The catalogue is ready and same can be obtained by writing H. West, proprietor, Scappoose, Ore., or C. D. Minton, clerk of sale, 310 Stock Exchange Bldg., Portland.

SEEDS AND BULBS.

SEED CORN: "LEAMING"—Best for ensilage. Second year's crop from pure-bred Eastern seed. Grown on my farm in Stanislaus county. Seed carefully cured. High percentage germination. Price, 5 cents per pound. Planting season begins in April. Order early. Montgomery Baggs, 311 California St., San Francisco.

GRAIN AND BEAN SEED—Three Money-Making Crops—Soudan Grass, Feterita, Tepary Beans. Buy now and secure first-class, authenticated seed from grower direct. Write for prices and instructions to Dittmar & Stahl, Ripon, San Joaquin county, Cal. This is the final appearance of this advertisement.

CALIFORNIA GROWN SUDAN GRASS SEED—Absolutely free from Johnson Grass or other Weed seed. Plant all you can of it; for Broody Chicks and laying Hens or sock of any kind you can't beat it. 30 cents per lb. Write for prices on large lots. Lasher's Hatchery, Petaluma, Calif.

WE BUY ALFALFA SEED containing Dodder, Mustard and other noxious seeds. Send us samples of any high or low grade seed you may have; also of mustard, burr and sour clover seed, flax, etc. Signed Mercantile and Warehouse Co., Fifth and Poplar Streets, Oakand, Cal.

SEED BEANS—We have choice Red Mexican and Blackeyes grown on sandy land, producing a heavy crop. Well cleaned and in good order. Write for prices to THE GRANGE COMPANY, Modesto, California.

SUDAN GRASS—The dry land hay crop. Recleaned. Certified Seed. 10 lbs. $1; 25 lbs. $2; 50 lbs, $3.25; 100 lbs. $6. F. O. B. Lubbock, Texas, ACME SEED CO.

SEED BEANS—White Tepary Beans grow without irrigation. 600 to 800 pounds per acre. Write for sample and prices. Robert A Read, Grower, Delano, Cal.

FOR SALE—300,000 yellow Jersey sweet potato plants. Prices from $2 to 50c per thousand. For information, write Parker Bros., Hemet, Cal.

TEPARY BEAN SEED—Recleaned A No. 1 seed. None better on the market. Also Sudan Grass seed; guaranteed pure. Carl Nelson, Strathmore, Cal.

SOUDAN GRASS—We had the best seed at Denver Dry Exposition: 50 lbs., $3; 100 lbs., $5, f. o. b. Amarillo Seed Co., Amarillo, Texas.

TEPARY BEANS FOR SALE—Eight cents per pound. Robert Paulsen, Lockewood, Cal.

TREES AND PLANTS.

WALNUT TREES — Late blight-resisting varieties grafted and budded on California Black and on FIRST GENERATION Royal and Paradox Hybrid roots, which are as much superior to the California black root as the California Black root is to the English root—Eureka, Franquette, Mayette, Neff's Prolific, Concord and Placentia. Dr. W. W. Fitzgerald, Elks' Building, Stockton, Cal.

30,000 CITRUS TREES—Navels and Valencias—27½c, delivered at your depot, anywhere in California, packed in moss, bare root lots of 500 and up; or 37½c in 35-lb. bails in 10-acre plantings. All big two-year-old stock; choicest ever produced by anybody, anywhere, at any price. Samples sent free on request. Lem. A. Runson, 1120 Haas Bldg., Los Angeles. Phone F 4003.

WALNUTS—Budded on California Black root; Franquette, Mayette, Concord, Eureka and other leading varieties. Extra fine stock. No better anywhere. Write for full particulars and prices. Woodbridge Walnut Nurseries, Motor Route B, Box 269, Modesto, Cal.

EUREKA WALNUTS ARE THE BEST.—Grafted on native black roots. Our prices will surprise you. Write today—tomorrow never comes. Geyer Bros., Walnut Nursery, 214 S. Alamansor St., Alhambra, Cal.

FOR SALE—Manzanillo Olive Trees, budded on Picholine seedlings. Younger and heavier bearers, longer lived and more vigorous trees than trees raised from cuttings. Geo. E. Rice, R. 1, Box 76, Reedley, Cal.

FRUIT AND ORNAMENTAL TREES and all kind of nursery stock, especially suited to Central and Superior California conditions. Buy from a responsible firm. East Lawn Nurseries, Box 418, Sacramento.

WILLSON'S WONDER and genuine Franquette trees and grafting wood for sale. Write for circular and prices. Encinal Nurseries, F. C. Willson, Prop., Sunnyvale, Santa Clara County, Cal.

NURSERY STOCK—None better. 2-year-old Navels, Valencias and Lemons, ⅝ and up, 25c, balled or packed in moss. Ask for prices on carload lots. J. C. Johnson, Azusa, Cal.

GRAFTED ENGLISH WALNUTS—A few hundred fine vigorous trees. Two-year-old California Black Walnut roots, one year Concord Walnut graft. Bishop Bros., San Ramon, Cal.

SWEET POTATO PLANTS for April and May delivery. California Yams, $2.25 per thousand, 35c per hundred, prepaid. J. Braswell, R. D. No. 2, Lindsay, Cal.

SELECT LOCKEFORD BURBANK—Rural and American Wonder Seed Potatoes. $1.50 per 100. N. H. Locke Co., Lockeford, Cal.

SOUR ORANGE SEED grown in section free from citrus canker, guaranteed fresh. Dr. L. A. Shattuck, Leesburg, Florida.

HUSKY TOMATO PLANTS—"Stone" twice transpanted, 5 inch, $1.00 per hundred postpaid. J. F. Swett, Martinez, Cal.

FOR SALE—Orange trees from selected two-year-old stock. K. Matsuoka, one mile west of Sanger, Cal.

PALM TREES—$1.00, $1.50, $3.00 f. o. b. Sunnyvale. F. B. Kraseman.

FOR SALE—Spineless Cactus Plants. Prices right. B. C. Enghert, Byron, Cal.

WANTED

WANTED—About sixty young men and women to enter the Western Normal to prepare for teaching, or to secure a high school education in the shortest possible time. Western Normal graduates secure and hold good positions. Time and money saved. For information address Western Normal, J. R. Humphrey, Principal, Stockton, Cal., Box 704.

MANAGER—SUPERINTENDENT—Stock, fruit, grain, alfalfa. Organizer, expert accountant, labor handler, construction, heavy machinery, details. Successful California experience. Open large permanent work. Box 211, Pacific Rural Press.

EXPERIENCED SWISS DAIRYMAN, married, with some help, wants to take charge of dairy 30 to 50 cows. Either on shares or wages. Box 213, Pacific Rural Press.

RANCH SUPERINTENDENT—Experienced in developing and handling large tracts under irrigation, desires location on salary or percentage. M. W. Russell, 1516 1st Ave., Seattle, Wash

DAIRYMAN WANTED to take charge of a 30-cow dairy in Yolo county on shares. A good milker and feeder is desired. W. H. Donaldson, Esparto, Cal.

LAND FOR SALE.

NEW OPENINGS—Enlraged Homesteads. Nearly TWO MILLION acres GOVERNMENT LAND, different counties, plainly marked on COUNTY SECTIONAL Maps, $2.50, any County. Booklet, map, circular FREE. STATE MAP, showing 600,000 acres of SCHOOL land opening over State, $2.50. Order TODAY. Checks taken. JOSEPH CLARK, Sacramento.

116 ACRES AT GRIDLEY, CAL.—All in alfalfa. Abundance of water and shade trees. Splendidly drained. Good improvements. Absolutely right and high-class. Owner, Paul Goodloe, Route 13, box 28, Gridley, Cal.

FOR SALE—Equity in 15 acres alfalfa land in Merced county. Would exchange for automobile or live stock. J. F. Herbert, 812 Spencer Ave., Santa Rosa, Cal.

160 ACRES near railway, well improved, on county road, suitable for small dairy or stock ranch. Good local market. A. O. Nelson, Raymond, Cal.

A BARGAIN in Olive, Orange, English Walnut trees and Thompson vines at Central Nursery, Route 8, Tulare St., Fresno, Cal. T. Kimura.

The Guarantee of Wholesome, Nutritious, Perfect, Delicious Baking

IS

SPERRY FLOUR

Its uniform high quality has made it the flour standard of the West. If you want to make good bread

Try This Sperry Recipe

All dry materials to be sifted before measuring; all measurements to be level.

- 3½ cups Sperry Flour
- 1 cup Water
- 1 teaspoon salt
- 1 tablespoon sugar
- 1 tablespoon shortening (melted)
- 1 cake compressed yeast

Dissolve yeast, sugar and salt in water (water 85° F.) Warm flour slightly and beat in a portion, adding shortening. When dough becomes too stiff to use spoon, turn on board and knead thoroughly but gently until smooth and elastic. Cover carefully and allow to rise in warm place (85° F.) until 2½ times volume. Knead gently and let rise again. Mould into loaves, and when double in size bake in medium, quick oven 40 to 50 minutes. (450° F. to 500° F.)

This will make one loaf weighing about 1 lb., 4 oz., and there are 55 of these loaves in a sack of **Sperry Flour**—the flour that enables the beginner, as well as the experienced housewife to produce good things to eat because it is the one flour that never varies—each sack is like every other sack.

Order Sperry Flour of Your Grocer

The Sperry Book, "To Think, To Live, To Do,"—tells you all about flour making—bread making and the cause of poor bread. **This book is free.** Write for it today. If you inclose a 2-cent stamp, we will mail you our much prized **Sperry Cook Book.**

Alfalfa Growing as a Specialty.

Faultless grading, summer fallowing, unusual irrigation, frequent cultivation, and careful harvesting at the right time, return heavy profits.

[Written for Pacific Rural Press.]

PROPER grading is the basis of Woodward & Sons' reputation as the best alfalfa growers in Perris Valley, Riverside county. Certainly they have the finest 80 acres one could wish to look upon, and no better can be found among the 6,000 acres of alfalfa grown in the Valley.

It is not all in the grading, however; for the brothers, whose father has retired, fondle their alfalfa lovingly as a good orchardist does his trees, or a good stockgrower his animals. And in the fondling, they have learned many of the likes and dislikes of this royal forage plant.

It is by acknowledging alfalfa's right to choose the conditions best suited for its thrift and by carefully supplying those conditions, that Woodward Bros. rejoice in the swift uniform growth of their protege.

Never do they have a pet scheme too dear to throw away if a better one presents itself. And while other alfalfa growers are forgetting their plants in winter time, the Woodwards are caring for theirs.

Summer Fallowed Land Best.—It was in April, 1913, that they planted 20 acres on deep, decomposed granite and silt grain land plowed the winter and spring previous. Here was their first lesson. April was too late and the seed bed too soft. They had plowed the rest of the 80 acres, but instead of planting it, they let it settle all summer and planted next November and December.

Next season the last planted alfalfa caught up with the first, and $7,000 worth were sold from the 80 acres. The last of the 1915 crop was sold Feb. 21, 1916, 163 bales at 1 cent per pound to a man who had previously bought 100 bales at $17 a ton. The 1915 crop fed 6 horses all season, put 892 tons 1705 pounds on the cars, and felt about 10 tons for further horse feed. That is close to 11 tons per acre.

A July Mowing Scene in Perris Valley. Seeded April 1. Alfalfa soon attains this long tender growth.

Enormous pumping capacity at Plant No. 2, Perris Irrigated Farms.

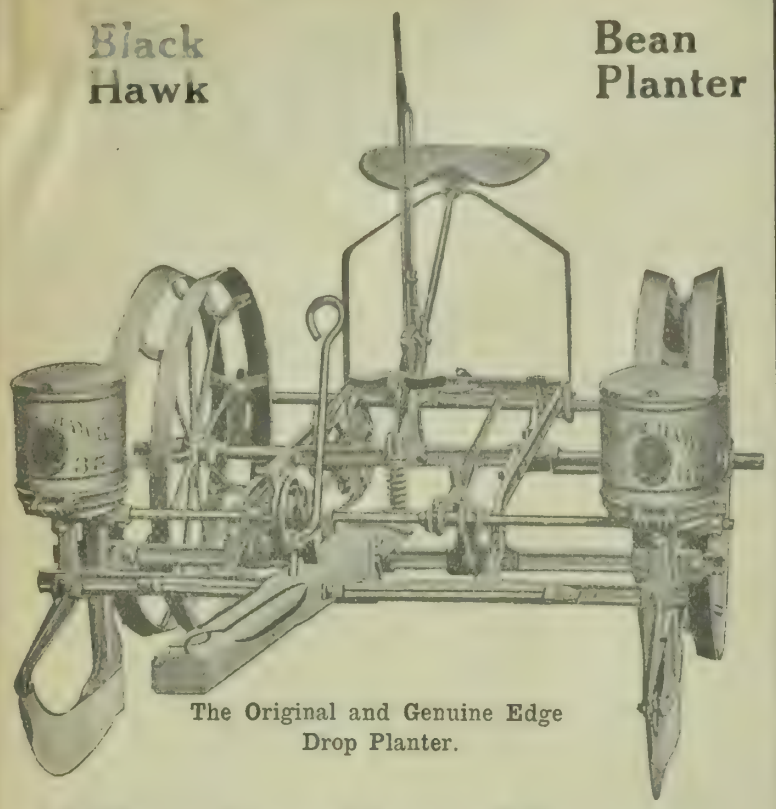
How does he do it? He got a fine uniform stand; he keeps it growing without any check through the hot weather.

Thin Sheet of Water Covers Ground.—The contract called for the ground to be plowed 8 inches deep in the winter and spring of 1912-13.

Then the field was graded—right. A low diagonal ridge took one man's time three months. Water might have been piped along this ridge and distributed in both directions. But the job was being done for all time. The 80 is ½ mile long, sloping toward the east 20 feet in that distance. The lower end is also sloped toward center, where a deep well is to collect drainage from all of the 40 half-mile checks or "panels."

Some hard ground was dug up in that ridge. It would not have been good for much that summer, anyway. It was distributed toward the upper end. "Borders" or levees were scraped up 33 feet apart. No clods were left on the surface of this decomposed granite soil.

The checks were tested by water from the pipeline which had been run from the pump at the lower end of the field to the head and across it, leaving one outlet in the middle of the headline of each check.



When grading was complete, the water ran over each half mile check like a sheet—not meandering here and there to fill hollows and leave islands. The job was being done so there would never be need to use a shovel in irrigating. No small patches of alfalfa were to be weakened by lack of water or oversupply so that weeds could get started.

Seedbed Fined and Firmed.—"Thorough cultivation after grading—that's where we put in our work." Except the 20 acres, and one panel which was put into garden, the field was kept free of weeds all summer. This allowed the upturned subsoil to weather, and drove out gophers, squirrels, and ants. After the ground became moist from the grading test, it was spring-toothed three times. It became so soft you would not notice hard streaks when you run your fingers into and through it. Then a spike-tooth harrow smoothed it down. All summer a buck scraper

SEE WHO'S HERE

Black Hawk Bean Planter

The Original and Genuine Edge Drop Planter.

When You Buy a Planter---
Get the Famous Black Hawk

Because it will plant any kind of beans, peas, corn, milo maize and other similar seed in rows 26 to 44 inches wide.

Because it has runners that plant an even depth, chain drive, automatic out-of-gear device, disc marker, 30-inch open or closed wheels with scrapers and removable boxes, and an auxiliary foot lift.

Because the plates are stopped and started between each cell, which causes the seed to settle in the cell before it comes in contact with the cut-off. This exclusive Black Hawk feature, which is fully covered by patents, increases the accuracy by at least 5%. Furthermore, this stopping and starting prevents the seed from being ground to pieces, as in many other planters where the plate is constantly revolving.

Because the variable drop device, which can be changed by hand or foot while the team is in motion, permits a greater or less amount of seed to be planted in different parts of the field as conditions may warrant.

Because a fertilizer attachment can be furnished when desired.

Aristocratic Livestock Down Peninsula.

[Showing how the development of one of California's greatest industries is rapidly spreading in a district primarily given over to fashionable country homes.]

BEING exclusive is a habit that the portion of the Bay Counties' Region, known as the Peninsula, has had since before civilization visited this coast, Mother Nature having started the ball rolling when she combined about as fine a lot of natural scenery as one could imagine in such a comparatively small area.

Since then there have been the artichokes and millionaires. It's hard to say whether artichokes made the Peninsula famous, or vice versa, but at any rate the California epicure doesn't think of one without associating it with the other.

With millionaires it has been about the same way. The Peninsula needed the millionaires and the millionaires needed the Peninsula, and the net result is that the country home district of this beauty-land is noted all over the world for its expansive elegance.

Unfortunately for both, perhaps, artichoke growing is not a particularly fashionable side line on modern country homes and estates of millionaires, either in America or Europe, so Peninsula residents have satisfied their fancy, for growing things, by raising wonders of the horticultural world.

But now a new agricultural industry is under way with a full head of steam, and from the successes of similar undertakings in this and older countries, it is fair to assume that horticultural novelties will soon have to take second place to breeding of live stock on these California estates.

Upper Left—Ayrshire bull, Robinhood 32nd. Lower Left—One of the good Berkshire matrons on Carruthers Farms. Upper Center—One of the Shire stallions in use at the Blackhawk Stock Farm. Lower Center—A portion of the Millbrae Holstein herd. Upper Right—A recent addition to the Steybrae herd from Canada. Lower Right—Shorthorn bull, Count Glory, herd sire at Carruthers Farms.

Of course, if you are acquainted with the country and its natural environments, you won't wonder that the California home of aristocratic man is also to be the home of the aristocratic farm animal. The greatest wonder is that the disease has been so long in spreading.

Holsteins the First Love.—As a matter of fact a germ of the livestock breeding disease was dropped in the district about fifteen or sixteen years ago when the D. O. Mills Company established a purebred herd of registered Holsteins on their 3,000-acre holding on the northerly boundary of the district, now known as Millbrae.

But for some reason the purebred enthusiasm of its founders got side-tracked in favor of commercial dairying, and as a result interest in the purebred herd simmered but did not blaze.

And then along come the general awakening in Holstein circles all over the country, and with it a realization by Manager John F. Cannon that, though their private records, which had been painstakingly kept for years, were of value for commercial dairying, they could not compete with the authenticated records of other ambitious breeders when it came to selling bulls.

Putting his decision in the matter up to the owners, Mr. Ogden Mills and Mrs. Elizabeth M. Reed, consent was given to furnish the purebred matrons on the ranch with such opportunities as other breeders were giving their animals.

The first official testing, done some two years ago, substantiated Mr. Cannon's contention, and since then several 25-pounders and better have been brought to light.

But that is only a beginning. The registered cows are to supplant the grades from now on as fast as they come in, about half of the present herd of 300 milking cows now being registered ones. And as they freshen they are to be officially tested in a modern test barn, which has just been erected.

English Shires.—Within walking distance of Millbrae, but surrounded by more natural and artificial scenery, you find the purebred germ working on a different branch of the livestock tree.

Here it is the breeding of Shire horses, under the tutorage of Messrs. Easton and Ward, that is furnishing a school in animal husbandry for surrounding home owners. Already the stud is recognized as one of, if not the largest Shire stud in the West, and its winnings at the Exposition livestock show established its claim for superior merit.

It is Manager Ward's ambition to have, in the Blackhawk Stock Farm's stud, only animals with clean limbs, having a minimum of hair instead of the highly-touted feathered legs of English favor. This, he believes, means the success of the Shire in this country, and with means in abundance to carry on the work of breeding for this type, the destinies of the Shire would seem to be in good hands. Surely in a branch of live stock breeding requiring capital to operate on a large scale, no more appropriate place could be selected than in the immediate vicinity of the Blackhawk Stock Farm.

Ayrshires at Summit.—But the Peninsula's livestock eggs are not all being put in one basket, nor are they being centered in one particular spot. You soon find this out when you begin a steady ascent to the Steybrae herd of Ayrshires, the home of which is situated on the crest of the mountain range which divides millionaire homes from the artichoke fields.

It is an appropriate place for the establishing of a purebred herd of these mountain cattle, and E. B. McFarland and son are enthusiasts at the business. They are awake to the opportunities of progressive dairy practices and are transforming dilapidated buildings into modern and sanitary dairy buildings, and the entire 700 acres is to be farmed for the cattle.

Their herd now totals some 70 head, the foundation of which has been purchased from the most famous herds in Canada and the East, as well as from the Clise herd in the Northwest.

It is the ambition of the owners to eventually carry about 250 head on the ranch, furthering the cause of the Ayrshire breed in California by maintaining a large herd of high-producing animals.

(Continued on page 432.)

Strawberries Evergreen and Everbearing.

In this article Mr. Etter concludes his sketch of the striking new varieties originated by him of which earlier portions appeared in our issues of March 4 and March 18.

[Written for Pacific Rural Press by Albert F. Etter, Ettersburg, Cal.]

More About the Trebla.—Recurring to the Trebla strawberry discussed in the Pacific Rural Press of March 4, we will now consider the prodigy of productiveness of many-sided ancestry that is with all its inheritance breaking away into a constellation of its own, the Trebla. This plant boasts of blood from the old Sharpless, and the Parry, popular twenty years ago; the Michel's Early from Arkansas; the Peruvian beach or sand strawberry brought to Eureka by Capt. Cousins between 30 and 40 years ago, from Callao, Peru; the little wildwood strawberry, common to the Coast hills from southern California to Washington; the beach strawberry from Devil's Gate near Cape Mendocino; and the Alpine strawberry from Europe. Here we have a strawberry with seven distinct types in its ancestry, but with no inclination to follow any one of them, but with prepotency to form a family of its own. There is no mistaking a bed of its seedlings, for they bear the impress of the Trebla type.

Trebla, in plant, does not look like any other strawberry I ever produced; and, though seven times a mongrel, when mated with another variety, it will impress the Treblar characteristics like a Berkshire does his.

A True Evergreen.—The ordinary strawberry has but one set of foliage in a year; the secondary foliage is only rudimentary, and is quite dormant all winter. The spring foliage of Trebla dries in July and its place is taken by an entirely new set of nice green foliage which is carried in all its verdant green through the storms of winter. Defying rain, frosts, and snow, they continue to perform their function until about the first of May. The runners likewise furnish sap to their growing sets up to the time they are in full blossom in May, while the ordinary varieties shut off all nourishment to their sets as early as the middle of November. The spring foliage begins to show up through the winter in February or March, according to the weather, and by May 1, there is a veritable second story of foliage on the plants, all standing, abundant, majestic, and erect above the old.

The blossoms of Trebla are borne on the long trusses that stand erect, but beneath the foliage, which effectually conceals the blossoms from view and affords considerable protection from light frosts. The blossoms are on slender stems, and they are so numerous that they become tangled with the leaf stalks, and with the additional protection of the drying winter foliage beneath, few berries are able to come in contact with the ground. However, if we get three scorching hot days just as the berries are maturing, like we got last June, it goes hard with the Trebla in all her glory. Then the plant is under its great strain in maturing an unseeming amount of fruit spread out on the ground; and, of course, the sun injures the previously unexposed berries, but still they do not sunburn as readily as the ordinary sorts. But after all, why should I worry if mamma Trebla can't stand such a trial of heat? She has two or three daughters who can.

Everbearing Activity.—A remarkable thing is the size and development of the runner sets by spring. Nourished by the mother plant all winter and spring, they develop as no ordinary variety possibly can. Think of a plant nourishing 30 sets up to the time the blossoms begin to appear on the sets, and then turning in and producing three quarts of berries without the husks. Fifteen plants did this stunt and that means that they produced at the rate of 25,000 quarts of berries per acre. Can you doubt, with their energy conserved, they are capable of producing at the rate of 40,000 quarts per acre, or at the rate of better than 20 tons of delicious strawberries, enough to stagger the imagination?

The fruit is of medium size and slightly rough rather than smooth, with depressed seeds. It is very solid, heavy, firm, and built all in one piece. It picks readily without the husk, and the color is red to very red and glistening. When canned, the juice is almost as red as Loganberry juice and will not perceptibly fade when exposed to the light for a year. The fresh berries will stain the fingers of the pickers like Loganberries and it will not wash off with soap. The fruit is just moderately acid, has splendid body, and is a good dessert berry with a refreshing flavor of its own. No amount of boiling will break Trebla up, the cooked berries being rich red and having a flavor second to nothing I have yet produced.

After maturing their crop of berries as best they could last June, after the unreasonably hot spell of weather, the plants took on their new summer crop of foliage, and went to bearing once more. Our last shower of the season was near the end of May, no further rain falling for nearly five months; yet through all this long dry spell Trebla (and No. 335) kept right on bearing rather nice, plump berries.

The everbearing Americus, Productive, and Progressive tried to bear also; but their fruit was seedy, rank flavored, and unpalatable. On the same ground potatoes and sweet corn both suffered so severely from the heat and lack of moisture that the potatoes were scarcely worth digging, and the corn was a failure.

Here, then, you have a truthful portrayal of the Trebla strawberry, which I firmly believe is the opening gateway to a wonderful new family of strawberries. To my mind, it marks a distinct type, and a breaking away from the hereditary type; a moving out into a field where the laws of heredity that govern plant life will have less sway over the offspring, and we will get new qualities in texture and flavors that were quite beyond us heretofore.

Offspring of Trebla.—Two seedlings of Trebla from seed taken from its first berries in the seedling patch are very unusual. One is a very large berry of No. 80 type, but much firmer; the other is a deep, dark green, leathery foliaged plant,

(Continued on page 416.)

Cured or Processed Prunes.

To the Editor: Pomona Grange of Santa Clara Co. requested that this be published. Colonel Weinstock's suggestion that the State should have inspectors to examine the packed prunes and guarantee them as up to standard, would be valuable if it could be carried out. But of that, I see no prospect. The prunes when now packed by the packers are in reality processed in such a way that they are cooked and if placed in hermetically sealed packages would keep, but otherwise they are perishable and will not keep long. An inspection before being processed even though perfectly satisfactory, and stamped with the State seal, could really mean nothing, as the processing renders the fruit perishable. To send such prunes East with the State label, and then have them go bad and be mouldy, would harm instead of help, and would go against all laws of advertising.

This uncertain quality of goods packed would also prove a barrier against selling at auction. Unfortunately, prunes are not considered a necessity of diet, though highly valued both as a fruit and for their medicinal qualities. Therefore, perfect curing and no processing is absolutely necessary for any market organization to be successful. We need middlemen and packers, but we should work to force all processing to be done near the Eastern centers, and as ordered, instead of being done here. Properly cured prunes, not processed, keep for a long time.

If perfectly cured prunes were inspected and received the State stamp, and were sent loose in large boxes to various centers in the United States, and there processed and packed as ordered, then we would never have mouldy prunes and could build up confidence and a widespread partiality for our prunes rather than those of other counties. The packers themselves understand how to do this, for they send a quantity of the largest and finest prunes to France in perfect condition and without any processing—merely well-cured and sterilized. These are then stuffed, which, to be sure, is equal to processing, but they are glaced, which has the same effect as hermetically sealing them.

What we ought to work for is to do away with packing here and have all packing done at the point of consumption.

That the packers have faith in prunes is proven from the fact that they are buying and planting large prune orchards. This also puts the grower more than ever into their hands and is but an added reason for a combination and working plan of growers, such as I have suggested. If an organization started in a small way to pack near the point of consumption, packing here would soon be discontinued by the packers, who would rapidly be forced to follow the example of the growers' organization, backed by the State.

Sivert H. Shelley, C. E.

Gypsum and landplaster have the same effect on a crop that whisky has on a man—they stimulate, but don't feed the crops **Gold Bear** Fertilizers feed your crops—they don't stimulate. There is a booklet that tells you why. Write for it.

For and Against Tree Records.

[Written for Pacific Rural Press.]

Two outstanding examples of citrus individual tree records on a commercial scale are J. S. Edwards of East Highlands, who knows the production of each of 40,000 trees, and the National Orange Co. of Riverside, whose individual records cover 65,000 trees.

This would seem like a formidable undertaking, but Frank Chase of the latter company says that the new economies, inaugurated on account of tree record keeping, largely offset the cost. An example of these economies is that pickers set the fruit from each tree beside it and go on picking. The wagon loader carries the fruit to the drive. One man per picking gang takes records, not only of yield, but of abnormal conditions of the trees and fruit.

Temporary Causes of Low Yield.—J. C. Perry, who has charge of the Edwards ranch, notes that the value of tree records may often be seriously affected by wholly temporary causes: that only the average of a series of years will show whether it is the nature of the tree in that location to bear light crops or coarse fruits, etc.

The past season was one of irregular bloom in these orchards according to Mr. Perry. When a blossom opens a day or a week before another blossom, each may equal the other in possibilities, but one may encounter unfavorable weather that particular season and show up poorly on the records.

Wet weather last season caught many of the blossoms; the petals molded, died, and dried. When they fell, the fruit fell with them. Fruit seemed to stick, where petals had fallen before wet weather. Neighboring trees bloomed at different periods. But favorable weather next year might be reversed—and anyway, the light crop this year would favor a heavier crop next year.

Which trees lost their fruit this season by such conditions, and which are naturally unfruitful, is not known; so this season's records alone would prove very little. The same is more or less true of any other season. A considerable number of consecutive seasons' records would be fairly conclusive. Logical record keeping would have to be extended to cover conditions at least of each well-defined group of trees throughout the year.

Where the records are kept with the idea of checking up the results of experiments in fertilizing, irrigating, mulching, pruning, etc., only several seasons' records would fairly prove the superiority of one system over another.

First Records Suggestive.—But the first year's record would in any event be rich in suggestions.

If an irregular patch of trees show poor results it is a tip to the wide-awake grower to investigate. If the trees have had the same cultural treatment as the rest, a soil auger may reveal hardpan, sandy subsoil, chalk, etc.; litmus paper may reveal lack of lime; digging may show a water-logged or unexpectedly dry condition; or a simple surface survey may show lack of drainage, or a leaching of fertility; or the records may suggest the seriousness of soil erosion where cover crops do not protect it during the winter.

Abnormal Trees Located.—One of the main economies found by Mr. Perry is that the record keeper notes gummed and scaly-bark trees, those which are affected seriously with scales, red spiders, etc. On reporting such trees to the office at night, immediate measures may be taken to control the pest before it spreads. In case of diseased trees, a man may be sent whenever convenient later on, directly to the trees needing treatment, without loss of time hunting for them or uncertainty as to having found the right ones.

A record showing coarse fruit, perhaps of the Australian type, would enable a man to go direct to the tree later and bud it over. A note showing general sickness would be a cue for early careful investigation.

Extra good fruit is also noted on Mr. Perry's records. This may be of great value in years to come, for many orchards may as well be propagated from such trees as from those bearing poorer quality. Fruit may also be picked from such trees for such lots, such as exhibitions or for use in opening new markets for a certain brand. With records, there need be no delay in locating the right trees.

The objection that a box at each tree must be left only partly full is met by D. Rycraft of the National Orange Co., who simply empties the partly filled boxes—carefully—into others when they are carried to the drive to be loaded and hauled to the packing house.

Their man weighing fruit kept records on lemons one year for fumigation, by noticing the red scales on the fruit. One man there keeps records for 30 to 35 pickers, while the record keeper for Mr. Perry handles about 50 pickers.

Systematic Tree Numbering.—Mr. Perry suggests that there must be a system in numbering the trees. Perhaps the best way is to put the block number and the row number on the upper tree of each row; then put the row and the tree numbers on each tree consecutively in the direction the water runs. White lead and boiled linseed oil without a drier are used.

A camel's hair brush was found too fine and soft for speed. A marking brush such as stores use on boxes works well on the Edwards orchard.

Wide lines to make the figures are not desirable, especially on small trees. Finer lines are as visible, because one must get close to the tree anyway. It was only after several thousand had been marked that it was found that the round marking brush could be trimmed down to a fine point with scissors by holding the bristles tightly between the fingers.

Mrs. Anna Todd has recently completed the planting of 20 acres of her land near Live Oak to Thompson Seedless grapes.

Bigger Crops by Blasting

"The O'Connor prune orchard in the Santa Clara Valley was blasted in 1913," says the California Cultivator. "Its largest crop in six years was 3,900 pounds. After blasting the crop was 8,000 pounds—more than double—in a dry year. The prunes from the blasted orchard were much larger and the trees made a better growth." By using

GIANT FARM POWDERS
STUMPING — AGRICULTURAL

in *your* orchard you can increase your crop, add to the water-storage capacity of the soil, and enable the roots to feed on fresh plant food in the subsoil.

Hundreds of fruit growers in all Pacific Coast States plant their trees in beds made with Giant Farm Powders. They have found that trees in blasted ground grow faster, bear earlier and yield better than those planted the old way. They use the Giant Farm Powders because these powders loosen and powder the soil instead of packing it. Ask your dealer for either of the Giant Farm Powders—Eureka Stumping Powder or Giant Stumping Powder.

Free Book on Fruit Growing

Every fruit grower will find valuable information in the Giant book, "Better Orchard Tillage," written to suit Pacific Coast conditions. It tells and shows how to plant trees and subsoil orchards in the most effective way. This handsome illustrated book—or others—free. *Mail the coupon.*

CALIFORNIA LEADS IN BARLEY PRODUCTION.

By George Robertson, State Statistician.

IN CEREALS California leads in the production of barley over every other state in the union, and the total exports of his grain also shows a large increase both in quantity and value. In 1913 the total quantity exported amounted to 12,782,000 bushels, valued at $7,882,000; in 1914, when the first effects of the war were being felt, the amount increased to 18,208,000 bushels, valued at $11,183,000; but last year to December 31, the amount made a still larger gain, viz.: to 26,490,000 bushels of value of $19,312,000, which is another illustration of the benefit that the European war has been to the farmer.

The quantity and value of dried beans and peas, which are also one of the leading products of California, show a record increase, the value of the exports in 1913 being $909,000; in 1914, $1,795,000; increasing in 1915 to $4,692,000.

How Blasting Soil Can Harm Trees.

[Written for Pacific Rural Press.]

A news item recently told about the loss of trees in the orchard of J. G. Williams, of Santa Barbara county. Here a hardpan of a sandy nature was blasted and the trees set immediately, with the result that during the next two years practically all of them died.

This is not a new story, and the reason for the death of the trees has been studied and understood in a lot of examples. The trouble first of all is improper blasting, and this is aided by poor planting. In sandy hardpan, and in clay, the effect of an explosion, particularly of the ordinary dynamites, is very much localized. If the charges are placed a little too deep, and are the least bit too heavy, the result of the blast is a cavity underground, beyond the reach of the shovels of the tree planters. Even where the charge actually blows out a crater, or hole, for the tree (which is exceedingly bad practice), there is likely to be a cavity underground.

In this type of soil, where the hardpan or clay usually is thick enough to resist the efforts of the explosive to break through to a lower and looser layer beneath, to set one charge off just where each tree is to stand invites a puddle or well of water under the roots. The explosive merely provides a loosened space in the ground, which acts as a reservoir, and holds water from the rainy season like a buried tub. This excess of standing water of course means a dead tree.

Proper blasting in such soil consists in using very light charges close enough together so that their effects overlap, and at least along the lines of the rows of trees. One man used two ounces of powder every five feet one way between the trees, and three ounces every ten feet the other way. This man blasts his tree beds with five charges instead of one, placing one where the tree is to stand and the other four about that spot and five feet away. The charges should be placed, as a rule, twenty to thirty inches deep. In rare cases they should go thirty inches or deeper. The depth and the amount of powder to use depends on the effects noted, which should be to heave the ground, but not to throw it into the air. A little dust will fly, but very little dirt, if any, should be observed above the blast. Proper blasting for trees will raise the surface of the soil about four inches. The ground must be dry when the blasting is done. Death of trees and positive damage to the soil surely will result from blasting when the ground is wet.

Proper planting in such circumstances is not different from proper planting elsewhere, but emphasis should be placed on making the soil tight about the roots. Good planting practice will see that the ground in the bottom of the hole is fairly solid—not compacted, but without cavities. Then, when the trees are set, the ground will be tramped and evenly pounded about the roots. It cannot be made too tight. It is probable that Mr. Williams did not do this in his Santa Barbara orchard. If he had, the trees never would have settled the second year as much as is reported.

In hardpan and stiff clay soils the trees never will do much without blasting, but the blasting must be done in ways that experience has shown to be right. The things to avoid are heavy charges, deeply placed charges, and blasting only where the trees are to stand, without breaking up the hard ground between the trees. Several small charges always are better than one heavy charge. The different explosions must connect and overlap in order to give the water in the ground a chance to spread about and move off.

As a result of the activity in army circles on account of the Mexican situation, buyers of horses for the U. S. Army have been in the country the past few days in search of suitable army horses. Just how many horses will be purchased for this trade is not given out, but at least one large San Francisco dealer is scouring the Sacramento and upper San Joaquin valleys.

California Fruits and How to Grow Them

EDWARD J. WICKSON.

Seventh Edition, Extended and Revised.

Contains over 500 pages of text with many illustrations. Goes thoroughly into every phase of that immense industry, California Fruit Growing.

In the preliminary chapters, the important subjects of Climate and Soils are handled in a masterly manner, with the necessary modifications called for by the immense latitude, the topography of the Country and the different regions with their relation to coast, valley and mountain.

The book then goes into the subject of Fruit-Growing from the nursery, on through budding and grafting, preparation for planting; planting, pruning the trees and thinning fruit; cultivation, fertilization and irrigation right along to picking, canning and preserving, with chapters on injurious insects, tree diseases and the protection of the trees therefrom. Every fruit and nut which can be grown commercially in California or countries possessing a similar climate, has received the attention which the forty years' experience of the author makes of incomparable value to the fruit grower.

Price, $3.00, Postpaid.

Choice Rice Land

320 Acres (Tulare County)

2 Good Artesian Wells, with good flow of water. Pumping plant installed at one well which will supply over 100 inches of water.

There is a **big bargain** in this for cash. Will sell all or divide it. 1½ miles to Railway Station.

Also 580 acres in same section. One fine artesian well, with good flow; also a pumping plant that furnishes over 100 inches of water, good 5-acre reservoir.

Will sell one-half or all at **bargain.** Located on Railroad.

Address: E. ALBERTSON, Whittier, California.

River Bank Protection

HAVE you property fronting on any stream? Are you losing valuable ground? Are your levees in danger from wash of river currents? Let us correct all these conditions with our Deflectors, Bank Potectors and Channel Changers by scientific methods and at a less cost than any known bank protection.

WHAT OUR DEFLECTORS WILL DO: Immediately stop bank cutting and loss of ground. Turn current away from bank. Form new channel in center of river. Protect bridge abutments and approaches. Cut out objectional sand bars. Build up your land by depositing silt along bank line. Will not interfere with navigation. Let us send an engineer to inspect and report on the cutting conditions of your land.

River Current Control Company

Standardizing Local Associations.

[Written for Pacific Rural Press.]

The greatest increase in membership made by the Cal. Fruit Growers' Exchange in any one of the past ten years, has been made since the Exchange field department was organized," says G. Harold Powell. "The department has been the direct means of getting 2000 acres signed up. Between 2500 and 3000 cars of outside fruit have come into the Exchange this year"

Increased number of local associations and of individual members is only one of several activities of the field department as given us by Mr. Powell in the absence of its manager, B. B. Pratt.

The advertised Sunkist and Red Ball brands of the Exchange have been packed by a large number of widely scattered Associations. Rules for exclusion of improper fruit have been supplied, but judgment in applying those rules varies as widely as the men who apply them. To get more uniformity in the grading of fruit packed under these brands is one big job for the department.

The decay which caused loss of as much as $50,000 a week to California growers last spring had been proved to be practically all preventable by careful handling, long before that season. Yet the careless handling proceeds. The department is demonstrating careful methods.

Much of that decay, as well as uneconomical packing, has been due to poor packing-house equipment. Mr. Pratt, through his assistants, F. G. Webber and W. G. Mumper for orange work, and G. W. Hosford for lemon work, has been helping local associations to plan and install the most desirable equipment.

Methods of keeping accounts in various associations have varied, and some of them have not been as easily understood by grower members as was desirable. Standardizing the bookkeeping of the associations is part of the field department's work, which goes along with aid in developing better methods of handling each organization's business.

The department is meeting the heartiest co-operation of the growers.

GEORGE HAD BETTER DO IT.

To the Editor: At a meeting of the Contra Costa County Fruit Growers' Association held at Concord, Contra Costa Co., Cal., on March 11th, 1916, the following resolution was unanimously adopted:

Whereas, the annual production of fruit constitutes one of California's principal sources of revenue, and whereas, the fruit growers of California already sustained an untold loss by the blockade of certain European countries, and whereas, Great Britain has placed an embargo upon canned and dried fruits which if carried into effect will bring ruin to numbers of fruit growers, thereby adversely affecting every citizen of California, and whereas, when disaster faced the cotton growers of the South, our Federal Government rightfully came to their assistance;

Therefore be it resolved, that we, fruit growers of Contra Costa county, in meeting assembled, do respectfully request that you use your best and every effort to have every arm of our Federal Government come to our assistance in this crisis, and use every measure to have Great Britain rescind this embargo which so surely means ruin to great numbers of our citizens. **T. H. Hook**, Secretary.

Concord.

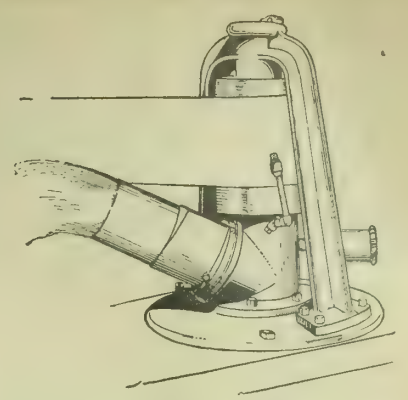
TALL GROWTH OF SWEET CLOVER.

To the Editor: Please inform your readers of the success of melilotus cover crop in the San Dimas district. We have an orange grove and planted our seed in October, giving it no water. It is one of the show crops in town and I have just picked, at random, one stalk that measures 5 ft. 1 inch long; the average being 4 feet and over.—W. C. D., San Dimas.

[That is good. When you get that cover crop covered in, will you not kindly tell our readers how you did it?—Eds.]

BLUEGRASS IN A LIPPIA LAWN.

To the Editor: The experience of many Californians justifies the claim that the best substitute for blue grass in the drier parts of the State is Lippia repens, a creeping lawn plant, which makes a handsome summer turf, needs little water or mowing, is unaffected by great heat, does not coarsen with age nor develop any pestlike qualities. Its only marked defect is that it stops growing with the advent of cold weather and through frost and rain becomes a dull gray green until the spring growth appears.



It is the writer's experience that this defect may be remedied in a very simple manner. Blue grass, which keeps green in winter in places where frosts are not too sharp, may be combined with the lippia. Bluegrass seed may be sown broadcast on a lippia lawn in March or April and washed down with rain or sprinkling. It grows well in with the lippia and keeps the lawn green through the winter.

A curious fact is that blue grass grown in lippia turf resists heat and drought far better than when grown alone. The writer has had blue grass in lippia go through a long, hot summer without a single watering and be uninjured, while blue grass alone in a nearby plot, died in July. Why lippia should foster and encourage a tender grass, while choking out and killing morning glory, as it certainly does, is one of the mysteries of plant life which sorely puzzles. **John F. Swett.**

Martinez.

AMERICAN RED FOR THE SOLDIERS.

America is shipping red dry wine to French soldiers. This is the statement made today by President Hiram S. Dewey of the American Wine Growers' Association: "The French for generations have furnished each soldier about a quart of red wine each day," said President Dewey. "Italy does the same. Now France has asked that we ship 1000 barrels of red dry wine, as there is a great shortage due to the poor crop of last year and to the war."

The Morton Turbine Pump Is Your Logical Choice Because—

It saves you money in initial cost of pumping plant.
It pumps more water with less horse power.
It pumps 250 gallons per minute from a seven-inch well.
It pumps 1000 gallons per minute from a ten-inch well.
It pumps 2000 gallons per minute from a twelve-inch well.
Every bearing is protected from sand and water and is lubricated by force feed.
The best well—the sandy well—is the home for the MORTON TURBINE PUMP.

Dry Farming Peaches Successful.

[Written for Pacific Rural Press.]

Growing peaches without irrigation in the sandy land east of Ontario requires the grower to keep ahead of his work. When M. Ruznak's orchard of ten acres, Phillips and Tuscans, was seen March 2; he had recently finished a thorough job of plowing. Most of the orchards in that section were still growing weeds.

"Why do you plow so early?" we asked.

"Because the trees and fruit need every bit of moisture we can give them," said he. "We can't afford to let weeds use up a lot of the winter rains, nor can we afford to let the ground crust and the water evaporate that way. If we get more rain after plowing, we can save it by cultivating at a cost of 35 to 40 cents an acre, but we couldn't get irrigation water that cheap."

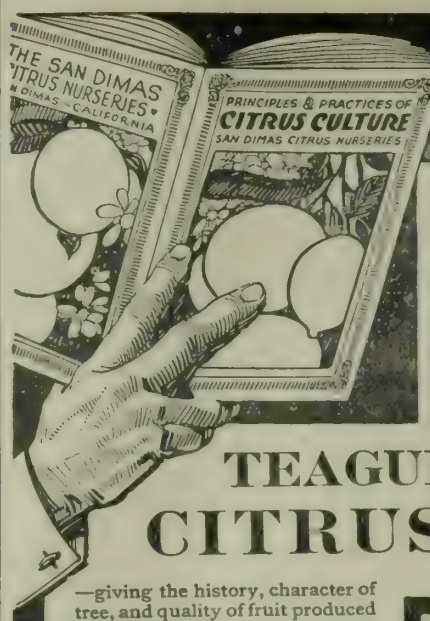
Whenever a little crust forms so that it breaks away in pieces when kicked with the feet, it is time to cultivate. This comes after every rain and often after a heavy fog.

A pike harrow is preferred at first as it drags dirt into the dead furrows. A springtooth is used if weeds get well started, which seldom happens. A weeder and mulcher is fine for the later cultivations as it does not stir up the moist soil to the top where it would dry out, but breaks up the crust and keeps a good mulch, and keeps the weeds down.

The yield of 9 tons of prime Tuscans from five acres of eight-year trees, sold to the canners without dockage last year, shows that peach growing on sandy land without irrigation can be made profitable.

STRAWBERRIES EVERGREEN AND EVERBEARING.

(Continued from page 412.)



an evergreen, and deep, dark-red berries of larger size than Trebla, and the plant is remarkably vigorous. The fruit is well flavored and is protected from the sun, suffering not at all from last June's hot spell that almost put Trebla out of commission.

There are many other new varieties here that I could comment on interestingly, but just now I am considering the new open gateway leading to many more, better, and more varied manufactured products made from strawberries. That the field can be enlarged and the total manufactured product greatly increased, there can be no question of doubt. That these robust, privation-enduring, beach hybrid plants, capable of growing on impoverished soils, and thus bringing under profitable production thousands of acres of land that heretofore have been unsuited to strawberry culture, goes without saying. That the world will appreciate and consume all of this improved type of strawberry products we can produce, is hardly to be doubted. Observation here would indicate that the taste for strawberries of these improved types does not need to be acquired, and long before it begins to tire it becomes chronic and will wear year in and year out.

Another World of Possibilities—When Prof. Jos. Burtt-Davy was a member of the faculty of the University of California, he interested himself in the beach strawberries of Point Arena, Cal. Some of the seedlings he grew were distributed by the University. I was among those who received these plants. The Point Arena beach berry is different from the form indigenous to the vicinity of Cape Mendocino. Only within the last two years have I used the Point Arena variety extensively in my work. From results in a small way, I feel that we have something different to expect from the Point Arena variety than we could expect from the Cape Mendocino berry. Thus does it come to pass that every step we make opens up new possibilities. Many and varying types of these beach strawberries are found along the Pacific Coast from Alaska to Patagonia and up the coast on the eastern shore of South America. If these are going to give varying results, and no two varieties of ordinary sorts work out the same when crossed with these forms, it puzzles one to figure out how much available material exists. Personally I have given up any idea of estimating what is available, because every move worked out seems to disclose factors overlooked before.

The Beaderarena.—One of these Point Arena beach hybrids of unknown male parentage is a pink berry of extraordinary size. Another collapses when you put it in your mouth like one of those frothy flakes cooks put on cornstarch puddings. The best of all, however, is a seedling of Beaderwood crossed with Point Arena beach. It has been named Beaderarena. This variety is a realization of what I have long desired—a variety that would retain the rugged characteristics of the beach strawberry in plant, and have the quality of the common varieties. As a matter of fact, the fruit of the Beaderarena is not like the ordinary strawberry, nor is it like the beach berry, nor like any other berry I ever produced. It is of a unique, sweet, and delicious flavor all its own. The berries are large, sometimes double, and flattened. In this form I have seen them nearly three inches wide. In color they are a brilliant red or scarlet. With the characteristic gloss of the beach strawberry, and the sunken brown seeds surrounded by flesh, the berry reminds one of a product of the jeweler's art. With so much beauty and the deep-set seeds, one would naturally expect delicacy, but the berry is really firm and bears handling well. Further than this, the fruit is held clear of the ground, and the variety is productive. Rain has no effect on the ripening fruit, and our hot weather had no effect on it. It is entirely free of leaf spot, fungus, exceedingly drouth-resistant, and the runners never burn on the hot ground, as almost all other varieties do. This would seem to indicate that this is the beginning of something that will make it possible to grow strawberries on very sandy land.

Two acres of fruit, vegetables, and poultry near San Gabriel provide more work for H. J. Hennings & Son than they can do. They are making big profits.

have you this Book

—if not, it will be our pleasure to mail you a free copy, *provided*, you will write us the number of Citrus trees and varieties you will require. Besides giving exact information on orange and lemon growing from seed to harvest, from packing house to market, it also describes

TEAGUE QUALITY CITRUS TREES

—giving the history, character of tree, and quality of fruit produced by the standard and ornamental varieties mentioned in the opposite panel. The book is sumptuously illustrated, thus affording a splendid object lesson of California's great citrus industry.

—for the past twenty-six years we have made the growing of citrus trees and the development and management of orange groves an exclusive business. This of itself insures quality in our nursery trees that no one contemplating planting an orchard can afford to neglect, particularly when we are offering stock at prices that are the lowest for the best trees that can be produced. All About Sudan Grass in California.

To the Editor: Can you give me all of the available information on Sudan grass, that is: How it compares with alfalfa? How it would do in Oregon? What it is good for? How it compares with vetch and oats for hay? How it does in a semi-dry country and the number of pounds of seed needed for an acre? Also cost of seed and where it can be obtained?—H. N. O., Independence, Oregon.

[Answered by Prof. John W. Gilmore, University of California.]

[In the first place it should be stated that Sudan grass should not be depended upon under soil and climatic conditions that will produce a good crop of alfalfa, or of vetch and oat hay. Sudan grass is a valuable crop in the Pacific Coast states, as well as certain Mississippi Valley states, upon lands which are so dry that alfalfa and corn are not sure crops. Under such conditions Sudan grass ranks well with the grain sorghums and is, perhaps, all things considered, better than other forms of grasses. So far as I know, no feeding experiments have been conducted to determine the digestibility or meat-producing qualities of this grass. However, it has been noted that stock relish Sudan grass hay and eat it up about as clean as they do any other hay of bright color and good aroma. In composition Sudan grass hay is as good as the best class hay, comparing favorably with standard Timothy or Kentucky Bluegrass. It does not analyze quite so high in protein, however, as does alfalfa, and consequently is probably not so valuable as a feed as that crop, and under circumstances favorable to alfalfa it does not yield so well.

We have no experimental data bearing upon the adaptability of Sudan grass to Oregon, but there seems to be no reason why it should not grow in all parts of the Pacific Coast where there are at least four months of good growing season free from frost or cold, foggy nights. Sudan grass is very much like sorghums (it is a sorghum), requiring a warm, dry climate during the growing season.

The amount of seed required per acre varies widely according to the condition of the soil in respect to moisture and tilth at the time of planting. If these factors are reasonably satisfactory it seems that from eighteen to twenty pounds of seed per acre are quite sufficient. In our experiments twenty-five pounds of seed per acre gave no better results than twenty pounds, and on one plot fifteen pounds of seed gave as good results as twenty pounds. The seed varies in price quite widely, and is at the present somewhat more expensive than it really should be. This, however, is owing to the fact that there has been considerable demand for this variety of seed, and the prices have been somewhat high. As much as $1.00 per pound has been paid for this seed, but good seed should be secured for from $.25 to $.40 per pound. In purchasing seed one should take precautions that the Sudan grass seed is not mixed with Johnson grass seed, for the two cannot be distinguished. If the Sudan grass could be purchased from northern regions which are too cold for the propagation of Johnson grass, one would be reasonably sure of its purity. However, there are dealers even in the southern latitudes that take every precaution to supply the best Sudan grass seed.]

RIDDING THE FARM OF WEEDS.

[Editor's Note.—This is the fourth of a series of five articles on weed eradication that have been prepared by Mr. O. W. Newman, Ass't Sec'y State Commission of Horticulture and which will appear in coming issues of this paper.]

CLEANING THE FARM OF MUSTARD.

Spraying with iron sulphate is the most practical and economical method of ridding large farms of mustard and other weeds. Experiments have been conducted at several agricultural experiment stations to determine the practicability of sprays as a means of controlling this weed and the results have amply justified the work. Thousands of dollars can be saved the large grain grower by eradicating such weeds from his fields. Iron sulphate will kill or control mustard, cocklebur, ragweed, dandelion, daisies, wild lettuce, morning glory, thistles, kinghead and many other broad-leaved plants, without harming the grain in the least.

The method of preparing the solution and the application are taken from Bulletin 179, University of Wisconsin Agricultural Experiment Station, entitled "Eradication of Weeds with Iron Sulphate."

Empty 100 pounds iron sulphate into a 52 gallon cask and fill with water. Kerosene and vinegar barrels are usually gauged at 52 gallons. If tank of unknown size is used put in 1-5 iron sulphate to 4-5 water by weight—100 pounds of iron sulphate will make enough solution to treat one acre, and the sprayer should be so regulated that it will cover an acre with 52 gallons. No harm will be done if the solution is put on heavier, but the cost of material will be more.

Spray with a power sprayer, special types of which have been developed for this work. The time to spray is when mustard is about 8 to 10 inches high, that is, when nearly all the seeds have sprouted. Spray on a sunshiny day to get best results.

The ordinary orchard spraying machine can be converted into a field sprayer by connecting a cross pipe, fitted with several spray nozzles, to the outlets. The object of this is to cover a larger area. The spray should issue as a mist, and not in drops as from a sprinkler. The force is used to penetrate the hairy or waxy coating of the weed leaves and reach the vital parts of the plant.

It is good for the eyes to visit the ranch owned by H. Van Heuvel west of El Centro, where registered Percheron horses, Holstein cattle and Duroc-Jersey hogs are being raised, as well as a number of race horses.

The monthly meeting of the Napa County Livestock Association was held last week, at which time it was decided to co-operate with the Napa County Farm Bureau in holding a county fair in Napa county some time next fall.

Choice, Healthy

Citrus Trees

Washington Navel and Valencia Orange, Lemon and Grapefruit; two-year-old budded stock. Trees in perfect condition—grown in exposed positions. Best citrus stock scientific culture can produce.

We have three citrus nurseries—Escondido, Anaheim and Los Angeles. If you are near these points we can save you money by shipping direct from nurseries. Special prices on large shipments.

$2 Combination Offer

Four trees—Washington Navel and Valencia Orange, Lemon and Grapefruit, $2. Additional trees, 50 cts. each—single trees, 65 cts. each. All trees carefully balled—perfect condition for planting. Write or ask for Mr. Peck.

Established 1871
Seed & Plant Co.

LOS ANGELES ··· CAL.

Citrus Tree Planters---Attention

Why not buy the best?

Buy from the biggest stock of clean citrus trees in the state. 100,000 trees—classy two-year-olds—no scale.
It will pay you to see us before buying.

McMillan-Graffen Nurseries, Spadra, Calif.

(Estab. 1900.) Take Los Angeles-Pomona Bus to Nursery.

Planet Jr. Farm and Garden Tools

cut down work and boost your crops

Old-time farming no longer pays—these scientific tools do the work of 3 to 6 men, give bigger yield, and save their cost in a single season. Invented and made by a practical farmer and manufacturer, with half a century's experience. Planet Jrs are strong and lasting. Every tool fully guaranteed.

72-page Catalog (184 illustrations) **free!**

We carry stock in San Francisco and Los Angeles.
Agencies in all principal Pacific Coast cities.

Describes over 70 tools, including 12 entirely new ones and improvements to our Seeders, Wheel-Hoes, Horse Hoes, Harrows, Orchard- and Beet-Cultivators. **Write for it to our nearest Agency.**

S L Allen & Co Box 1203F Philadelphia

No. 25 Planet Jr Combined Hill and Drill Seeder, Double and Single Wheel-Hoe, Cultivator and Plow is a splendid combination for the family garden, onion grower, or large gardener. Is a perfect seeder, and combined double and single wheel-hoe. Unbreakable steel frame.

Planet Jr 12-tooth Harrow, Cultivator and Pulverizer is stronger, steadier in action, and cultivates more thoroughly than any other harrow made. Non-clogging steel wheel. Invaluable to the market-gardener, trucker, tobacco or small-fruit grower.

No. 25

North Whittier Heights Citrus Nurseries

Growers of

HIGH GRADE CITRUS TREES

Oranges Lemons Grape Fruit

We have spent our entire life growing citrus trees. You cannot buy better citrus trees than we offer you. All trees from stock of 1 and 2 year buds, selected with greatest care, and taken from our own grove. Our nursery is located in a clean district—our trees absolutely free from insect pests, 5-8 and up, guaranteed **TRUE-TO-NAME.** You cannot beat our prices for quality stock.

POLLARD & MARTIN.

SUDAN GRASS

The Great Forage Crop for Dry Regions. 30c per pound, postpaid. Special price on quantity. Page 33 of our **Free Catalogue** tells about it.

California Weather Record.

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau, at San Francisco, for the week ending at 5 p. m., March 28, 1916.

STATIONS	Rainfall Data: Past Week	Rainfall Data: Seasonal To Date	Rainfall Data: Normal To Date	Temperature Data: Max'm	Temperature Data: Min'm
Eureka	2.02	34.76	37.96	58	34
Red Bluff	.03	19.59	21.05	72	36
Sacramento	0	18.04	16.69	70	40
San Francisco	.14	27.05	19.26	64	44
San Jose	.13	16.17	14.41	68	32
Fresno	.08	11.55	8.13	70	38
Independence	0	7.16	8.00	72	
San Luis Obispo	.20	26.51	17.79	74	38
Los Angeles	.10	19.61	13.74	80	44
San Diego	.04	12.47	8.72	88	44

THE WEEK

ALL things in the sky-department of California agriculture continue favorable to the good output for 1916, which we enjoyed prophesying last week. It is true that we had a tight squeak to escape the hard frost of which the Weather Bureau gave warning a few days ago, but the Pacific Ocean was onto its beneficent job and rolled in a small storm center with lots of clouds and wind, and lightened the task of the oil-pots in covering deciduous fruits against frost, so that, so far as we have heard, no notable injury was done. The fruits are still coming on and fortunately growers are getting well waked up toward safe-guarding the sale of them. Col. Weinstock's offices have the aspect of a presidential candidate's headquarters at a national convention, with the thongs of "the faithful" reporting the steadfastness of the rural districts. We expect that the colonel will help a lot in selling our surplus products more profitably, but if he does not sell a dime's worth, beyond the seventy cents' worth of celery which he sold for a Japanese brother the other day, we can see inestimable value in his establishment as a dove-cote to which all with weary pinions can fly. For really, we believe, the fundamental secret of better things is to get together and the producers' rush for co-operative help is the best indication that they will get it. They may think the State is doing it for them, and perhaps it is. Perhaps, again, the State is only teaching people how to help themselves, and that is the grandest function of a State. No matter if there is fifty per cent more snow at some points in the Sierra than is usual at this date, and though Britain has turned a commercial shoulder which might freeze one's ears to lean upon, there is a rush of warm blood in the California producing people which gives a most healthy glow to the outlook.

QUARANTINES WITHOUT REASON.

WE ARE perhaps getting our proper pay for some of the unreasonable quarantines which we ourselves sometimes set up in the restrictions which are being enforced against us. The latest and most ridiculous of these is the Oregon attitude toward California potatoes because the tuber-moth occurs in this State. We have been swapping potatoes back and forth with Oregon for the last 65 years, and for 40 years to our knowledge (and we know not how much longer) we have had this tuber-moth abundantly in this State. And now the Oregon State Board of Horticulture has established a quarantine which practically prohibits the shipping of California potatoes into Oregon. It requires that all shipments entering the State must first go to Portland for inspection, which means that the consumer in Southern Oregon must either pay double freight to Portland and back, or do without California potatoes. The Oregon officials propose to burn all potatoes which do not pass their inspection, and we have no particular objection to that perhaps, although the injury to the potato is largely local and superficial. But the requirement that all potatoes go to Portland for inspection is from one point of view, practically exclusion and arbitrary restriction of trade. The ridiculousness of it, from another point of view, is greater than its grievance, because if Oregon has neglected her opportunity to get and rear this pest for the last 40 years and more, she is now taking the best possible way, not to keep it out, but to widely spread it. While she is hauling mothy potatoes back and forth through the State for inspection she is inviting the moth to fly ashore from boats, freight cars, or in whatever other container wormy potatoes travel, or in whatever warehouse they rest. It would be vastly more sensible to hasten the potatoes speedily and directly to the pot, and let them do as little Oregon traveling as possible. California potato-shippers are taking up the matter with the Oregon authorities. The quarantine is, however, unreasonable as well as ridiculous. If Oregon could not get the moth to live there after half a century of introduction, the lesson is that this insect does not like Oregon any better than it does other northern States.

FARMERS MUST GET MORE AND NET MORE.

AS WE stated last weeek, we propose to keep up a hubbub on this subject until something comes through or we get pulled by the police for disturbing the peace. There is no use trying to drift along as a rural pacificist, or passivist if you like that better, while everything from empires to economics is at war. Farmers must get more from the soil by better farming and must net more from what they get, by using cheaper money in production and by cheaper methods of distribution and trade. And they must do all this for themselves, because no one else either can or will do it for them. And they can do it for themselves because science, in two of its branches, natural and economic, is clearly pointing out the way. Science is hard and relentless, it is true, but everything soft seems to be going out of the world—even the brotherhood of man does its loving with hard knocks. But this is not the top-end of a sermon this time. We have to do with a single fact, out of many which show indisputably that unless the farmer does get more in the ways stated he will get less of a living—if he manages to live at all, in a business way. This single fact is that the implement makers must raise the prices of the tools and machinery they furnish. The way it is going with them is shown in a statement furnished us by the John Deere Implement Co. describing the advances in the cost of supplies used in their manufacture as a thing never before experienced in the implement business. They say:

Bar steel has already advanced 67 per cent. and the end is not yet; bar iron, 110 per cent; pig iron, 45 per cent; sheet steel, 96 per cent; naphtha, 134 per cent; scrap iron, 45 per cent; bolts of all kinds, 85 per cent; rivets, 75 per cent; nuts, 80 per cent; cotton duck, 60 per cent; fuel oil, 78 per cent; high speed tool steel, 500 per cent; high speed drills, 500 per cent; coke, 30 per cent; borax, 45 per cent.

We find that today the shop cost of making such a simple implement as a two-section drag harrow is 32.4 per cent greater than it was recently. It costs 34.5 per cent more to make a 14-inch steel beam walking plow than it did before. More than 26 per cent additional expense has to be put into an ordinary riding cultivator. And on an article like the New Deere Gang, something as staple as sugar, the shop cost has increased 29 per cent to date.

But the increased cost of implements is not the only new tax which comes upon the farmers' business of food production. Nearly everything he uses costs him more. In some lines there may have been compensation in higher produce prices, but the farmer does not get his share of that, and in many articles, he is hurt and not helped either by the war nor by recent changes in governmental policies, and he must therefore address himself to the situation with all the wisdom and co-operative force which is now becoming more clearly available.

A FARMERLESS TARIFF COMMISSION.

SPEAKING about recent changes in governmental policy not helping the farmers we are thinking, of course, of the tariff commission which all agree is likely to come out of the recent "great cry and little wool" about free trade helping the farmers. But we are not going into a tirade on that subject. We have had a very sharp illustration of the folly of making American products dependent upon foreign trade when there isn't any, instead of developing American demand for American products and watching our chances to sell to the world when we have a surplus which can be sold abroad to advantage. It seems pretty clear that we shall have next a tariff commission to see that foreign producers cannot undersell us in our own markets because they have available labor at a quarter of the wages which American standards of living require our producers to pay. But there is very grave doubt that the forthcoming tariff commission will be broadly representative of producing interests. We read this in an eastern exchange:

We have been suspicious from the beginning of the present movement for a tariff commission. We have feared that it was a scheme to put tariff tinkering into the hands of a little coterie representative of selfish interests. That our fears were justified is proved by the fact that the congressional committee, which now has the subject under advisement, is divided upon the proposition as to whether agriculture or labor should be represented upon the proposed tariff commission! So much tariff tinkering has been done regard-

ess of agriculture or labor, for these many ears, that perhaps it is not surprising that ertain congressmen of the old school should dhere to the principle that the tariff belongs o the manufacturing and commercial interests.

And there you are. We have no fear that he labor interests will not be safeguarded. o long as Samuel Gompers, one of the smooth- st advocates and most astute politicians we ver knew, sits beside the rathole in Washing- on nothing can go in or out without the roper labor scratch on it. And we are not ob- ecting to that: it simply shows where organ- zed labor is wise. But how is it with agricul- ure? As usual, agriculture has a pack of rep- esentatives of national reputation on the vatch and every time the politicians make a lash at the hole to put through something gricultural, the pack splits up and all the ittle bunches begin chasing each other—mak- ng an amusing spectacle in the public eye, but eaving the hole unguarded. Therefore we are ery sure that, while it is well to have the na- ional representatives of agriculture at Wash- ngton, it is also very desirable that individual armers and local farmers' organizations in all arts of the country should maintain direct ommunication with their own senators and epresentatives and freely communicate their wn facts and convictions as to what is good or the farming interests of the country.

WHO'S AFRAID OF PATERNALISM?

SOME people affect to be scared of pater- nalism and affect also to regard it as a hing imported from the effete monarchies of Europe—rather more effete now than usual, y the way. It occurs to us, however, that aternalism is a thing of some age even in America. We will not base a claim on the istoric fact that Washington was the "father f his country," for that tribute was previously aid to Abraham about 4000 years ago: to Akhnaton, the juiciest of the Pharoahs, about 3500 years ago, to some of the Caesars prob- bly, and was later awarded to the first of the Medicis, who may have been a good enough father for Florence but was the progenitor of rather a bad bunch of other people—a misfor- une which Washington carefully guarded against. So we do not count the begetting of a country as included in what we now under- stand as paternalism. But even so, American paternalism, involving the attitude of the gov- ernment toward the individual, is sufficiently old. For our present purpose we will assume that it began with William Penn when he had that memorable paternal pow-wow with his Indians in 1682, for it was he who undertook to fill his dependents with brotherly love, in stead of lead and whiskey, which Penn clearly saw, by the experience of his contemporary colonial fathers, had a tendency to develop destructive initiative and individualism in them. And those who are studying deeply the contemporary vexed question of paternalism vs. individualism should take note of the fact that the government of Pennsylvania is still strongly paternalistic and yet nobody is afraid of it—except when it happens to take on the modern form of bossism, for which Pennsyl- vania has also gained some repute. Our evi- dence in support of the contention that benefi- cent paternalism still exists in the land of Penn is found in a fat pamphlet, just received, in which is given a "List of Farms For Sale" —varying in price from $2.50 to $100 per acre, and does this with this paternal purpose: "To have every acre of Pennsylvania farm land occupied by the best possible farmer." It is not "state land." The farms are now owned by individuals, who are, presumably, not mak- ing profitable use of them and would like to sell out. And yet when the State of California proposed to turn idle and unprofitable lands to better farmers and better farming what a hullaballoo the individualists make about it. It was Pennsylvania, you remember, which recently raised a monument to the memory of Adam, because it was thought that his dis- tinguished service to the human race had not been adequately commemorated. Surely Pennsylvania is the place to go to study pater- nalism in America.

OUR FRUIT VARIETIES ABROAD.

WE WOULD like very much at some time to make a study of the impression the fruit-varieties originated in California have made on the commercial product in other parts of the world—but we seriously doubt if we shall ever get to it. It would naturally be based upon the catalogues of commercial nurserymen because, after you pass the few "wonders," which they offer for the delight of curious amateurs, you soon come to the lists which they make up of varieties that have been shown to be worth planting in their parishes. Taking such lists from various re- gions of the United States, Canada, Argentina, Australia and New Zealand, the Mediterranean region, South Africa, etc., one is likely to find that California has contributed largely to the varieties which they choose to build fruit in- dustries upon. Such a study would make good thesis work for a University pomological student, if carried beyond catalogues into ex- periment station reports, transactions of horticultural societies, etc. The thought comes from reading a contribution from Texas to the Fruit-Grower of Missouri, in which the Mammoth blackberry of California is men- tioned as one of the two best early varieties in Texas and of which the grower seems de- lighted to have gathered "nine berries which measured more than twelve inches over all." He also finds that his next best berry to ripen is the Jordan which he holds to be "the same as Crandall's Early for California." This in- volves another interesting pomological point because the late Dr. Crandall of Placer county believes he obtained from Texas the berry which now bears his name, because he lost the name under which he obtained it. It is up to some student to trace back that Jordan and see if it existed in Texas prior to Dr. Cran- dall's importation. It "was given to Dr. Cran- dall by a stranger hailing from Texas" some years before its offering by the late W. R. Strong & Co. of Sacramento as early as 1886. It is good fun to chase up these histories of varieties if one has the time and access to early publications.

Queries and Replies.

Querists must give name and address.

Is Tepary Doubtful as Tipperary?

To the Editor: I intend to plant 45 acres to tepary beans, but local dealers say they are poor sellers. Can any one give me some ad- vice?—G. H. W., Turlock.

We have already published all that we can find out about marketing teparies, and it is to the effect that their price relative to other beans is not yet established. They are a new thing and the trade always balks at a new thing. It has to do that, because it does not know what consumers will do about it. So far as the present impression goes it seems to be that the tepary is a poor bean as compared with small whites, which are nearest to it in size, and therefore cannot be sold at small white figures. The seed demand which has helped early growers of teparies cannot, of course, be counted upon much longer unless people take to eating the crop grown from it. Our impression is that, as things now are, 45 acres would be a good many teparies.

Rains on Fruit Blossoms.

To the Editor: Is it positively known whether a rain coming on a prune orchard in bloom just before the petals fall injures the crop or not?—Subscriber, Visalia.

It is just about as sure as anything is in this uncertain horticultural world. Frequent ob- servation has noted reduction or loss of crop under such conditions. And it applies to many other fruits than prunes. For instance, in our bunch of apricots, including six varieties, we can hardly find enough little 'cots to count, this very year, and the trees were drenched all through blooming. If all apricot trees looked like ours there would not be any for the British to exclude, but it will not be like that for we live in a rainy corner of the bay district. Though the fact is well established that rain is not good for fruit blossoms, it is not so clear why it is bad. Is the pollen just naturally washed away, or is it made too soggy to act or to fly on the air to the pistils, or does the blossom go amiss because the bees are not working? These are all reasonable conjec- tures, but we are not aware that any of them have been actually determined. Again, it is reasonable that if the rains should not come until a little interval after the blossoms open they might not interfere, because pollination is known to be ready to act at the first chance it has and rain could probably not catch up with a contact which had passed. Again, too, there is an impression that a drenching down- pour can do more harm than a light shower, that a cold rain might be worse than a warm one, etc. But these doubts do not affect the main fact which you ask for—unless you are placing emphasis on your words "just before the petals fall." We would say great harm is likely "just as soon as the petals open." Very soon after that it does not matter whether it rains or not. From that point of view the petals of a blossom are beautiful long after they have outlived their usefulness to the plant.

Killing Old Fruit Trees.

To the Editor: I wish to know of something to put around old fruit trees so as to kill them by fall.—W. P. W., Smartsville.

You can kill them by digging in rock salt or white arsenic, but they will kill the soil for a number of years. You can kill the trees without killing the soil by pouring from a quart to a gallon of gasoline (according to size of tree) against the butt so it will follow down to the main roots. But these ways still leave you the stump to grub out. The neatest way to get out as well as to kill, is to put a little dynamite under the stump in a hole made with a bar. The powder companies pub- lish pamphlets telling just how to do it.

Don't Risk Greatest River Improvements.

It seems possible that in the rush for a country-wide scheme of river improvement the completion of a great piece of work in California may be endangered.

To the Editor: The recent session of the Inland Waterways Association was held for the purpose of endorsing the Newlands Bill, so called, which proposes another National Commission, full-jewelled in every hole with salaried offices, and with authority to supersede and displace all state and local action relating to waters and floods.

The scheme is of great interest to all who are concerned in the flood control of the Sacramento and San Joaquin rivers.

The field covered by that problem has been joined in one drainage district, covering the swamp lands in the Delta and those overflowed on the banks of the streams. This drainage district is put by state law under the authority of the Reclamation Board, of seven unsalaried members, to co-operate with the U. S. engineers in carrying out a plan of flood control that is endorsed by the state and the U. S. War Department.

Nothing was done until the flood of 1909 broke the levees in nearly half the Delta, causing a loss of millions. Then the island owners met at Rio Vista and organized the San Joaquin and Sacramento River Improvement Association, with Captain A. E. Anderson as President. This body and the islanders were instrumental in raising of private funds $250,000, to buy and deed to the United States eleven miles of land on each side of the Sacramento, from Rio Vista to Collinsville, to uncork that stream by widening it to 3000 feet in order that its floods might pass out of the Rio Vista basin into Suisun bay, without flowing into the San Joaquin river by Three Mile and Georgiana sloughs and the Mokelumne river.

Supplementing this laudable self-help of the island owners, Congress and our State legislature each appropriated $400,000 to do the necessary dredging. The Sacramento on that lower reach narrowed to only 500 feet. It has now been opened on the whole stretch to 3000 feet and the good effect has been felt this winter not only at the city of Sacramento but clear to the Feather river.

A new current has appeared in the Sacramento from above Walnut Grove and the scouring out of the channel has resulted with the deepening of the stream, and but little water from the Sacramento has appeared in the San Joaquin, and no levees have been broken.

The work on this first unit of the flood control project should be promptly pushed to the mouth of Cache slough, the outlet of Yolo basin, in order that when the American river flood is thrown across the Sacramento, escaping by a weir into Yolo basin, the wider stream from Cache slough will carry it to Suisun bay, scour the river in the interest of navigation, and spare the levees.

After forty years of talk and experiment, this is the first practical work done for flood control. The effect of what has been done is so plain as to cry out for a continuance of the work.

Now the Newlands Bill will stop this work, and everything must wait for a new plan, and the money, and Federal Commission to carry it out.

The authoritative advocate, employed to push the Newlands Bill, addressed the convention. The river and Delta people desired to know the flood control plan of that measure, and sought knowledge by asking questions of this advocate. They were told first that the floods were to be reservoired. The maximum flood flow of the Sacramento is 660,000 second feet. As all attainable reservoir space in the Sacramento Valley will hold only 25 per cent of that flow, the people wanted to know what was to be done with the remaining 495,000 second feet, because a flood of 260,000 second feet destroyed their levees in 1909. They were answered that a high line canal would be built on the western slope of the Sierra to carry the Sacramento river to the lower end of the San Joaquin Valley, as a permanent supply for irrigation, and that another canal, on a lower grade, would be built to carry the floods and "fan them out," on the surface of the land in the San Joaquin Valley!

The people in that region, where irrigation has already raised the water plane, so that their problem is drainage, did not seem pleased with being fanned in that way, so when the vote was taken the Newlands Bill had 44 votes, to 41 against it. Such an endorsement may go for what it is worth. But one thing is sure, 44 people in a catch-as-catch-can convention, should have little weight as an expression of this State on a matter of such vast importance.

The Delta and river people there, and repeatedly before, asked an amendment to the Newlands Bill, excepting the Sacramento flood control project from its provisions, and this has been refused by Senator Newlands and the itinerant advocate of the measure.

Having begun something, let us finish it, and not give way to empirics, theorists or charlatans.

Oakland. Jno. P. Irish.

The Modesto Farmers' Inc. recently began the erection of a new warehouse. This organization is a co-operative association of farmers with a capital of $50,000.

KING EIGHT CYLINDER

Every dollar planted in this big powerful Eight will return many miles of *matchless* riding satisfaction

Here is a printed "demonstration" which the local King dealer can make a fact

FLEXIBILITY—INSTANT "GET-AWAY"

With seven passengers can be throttled down on "high" to two miles per hour. At this "creep" one can walk alongside, raise hood and examine engine. Small bore long stroke cylinders with extra large valve ratio, combined with a perfectly balanced crank-shaft and fly-wheel, explain this extraordinary performance. A touch upon the accelerator and the car is away at a racing speed.

ACCELERATION—HIGH SPEED

From two to sixty miles an hour without gear changing, vibration, or noise. We believe the King gathers speed with greater rapidity than any other car on the market and all accelerometer tests support this opinion. Eight cylinders, aluminum pistons and large valves help make this possible. Engine gives nearly 3000 R.P.M.

HILL CLIMBING ON "HIGH"

An unperfected experimental car of this model ascended the famous three-mile twisting hill of Uniontown, Pa., on "high" with six passengers, average weight 176 lbs. Slowed down to 5 miles per hour and accelerated to 35 on steepest part of grade. With two passengers made these three miles in four minutes and forty-one seconds with full touring equipment. Starting from Denver in "high" climbed Lookout Mountain and Genesee Peak, Colorado without once shifting gears or slipping clutch.

EASE OF OPERATION—COMFORT

The ideal car for women who drive because of little gear shifting—and that little made easy. Steers without effort. Long Cantilever springs of King design give all-day trips an "easy-chair" comfort.

ECONOMY—LONGEVITY

The constant flow of power given by the high-speed eight cylinder King engine permits the use of light reciprocating parts which reduce friction and vibration to a minimum. This results in a most remarkable economy of fuel, oil, tires and repairs and spells a long, efficient life for the car.

KING MOTOR CAR COMPANY ::: DETROIT

What is Done for Johnson Grass in South

[Readers who have this pest in their orchards or vineyards may look sour when it is discussed as a possibly useful plant, but that is the way they treat it in Louisiana, as a bulletin just issued by the Experiment station of that state shows. They say that the grass thrives best on deep loam soil. It does not do well on poorly drained land and is a failure on poor hill soil. It is strictly a rich land crop. This agrees well with California experience and if any of our readers have it on such soil they may like to try some of these ways to make use of it.— Eds.]

Hay.—Johnson grass is primarily a hay plant. As such it is superior to any other grass in the South. The hay is greedily eaten by all hay-eating animals and is equal in feeding value to Timothy hay of like grade. It is a heavy yielder, the writer having harvested more than six tons per acre, though an average yield on good land of two to three tons per acre is satisfactory. On thin soil, or where the stand is very poor, very much smaller yields may be expected. The grass responds to good drainage, fertilization and tillage as readily as any crop grown.

Pastures.—Johnson grass cannot be recommended as a pasture grass. The tramping of stock and close grazing so weaken its growth that very little pasture can be had from it. The only way that a fair amount of grazing can be secured is to rotate pastures—graze for not more than two weeks and take stock off till the grass recovers. Then graze again.

Curing Hay.—On account of its tendency by rank growth to produce a heavy stalk, this grass is a little more difficult to cure than ordinary grass. It should be cut when most of the stalks are in bloom. If cut earlier than this the yield will be reduced, while later cutting will result in a coarser and inferior grade of hay.

Silage.—If one has a silo on the place it is advisable to cut Johnson grass with a binder and make into silage, when the weather is unsuited to hay-making. It will make silage equally as good as corn or sorghum and has the advantage of them in that red clover, vetch or alfalfa grows well with the grass and can be cut all together at the spring and early summer harvest. Such mixtures make a superior grade of feed when put in the silo together. As a soiling or green feed crop dairymen find it one of the best that can be grown.

Oats and Johnson Grass.—This is one of the best combinations of forage crops with which the writer is acquainted. The land infested with the grass should be plowed well and deep after the last cutting of hay and planted to oats in October or November. When ready to cut for grain or hay the grass will have grown to a foot or more in height. The mixture of straw and grass make a very good grade of hay after it is passed through the thresher. Two and sometimes three good cuttings of hay can be secured from the land after the oat crop is harvested. After the last cutting of hay the land should be replowed and planted again to oats. Hairy vetch can be seeded with the oats and after once being established will reseed the land in subsequent years. The vetch will add to the value of the straw as a feed, and being a legume will aid in keeping up the supply of nitrogen in the soil.

The Mississippi Experiment Station has grown this combination of crops for ten years continuously on one piece of land without any fertilizer treatment and the yields have not appreciably decreased. Published results for two years show yield of 46 and 53 bushels of oats per acre, and one and one-half and two and one-half tons of hay per acre. The crops showed a net profit per acre of more than $40 for each year.

Alfalfa and Johnson Grass.—On land adapted to the growth of alfalfa, which is already set to Johnson grass, alfalfa may be planted just as though the grass was not there. By giving the land the necessary preparation for the alfalfa there should be no trouble in securing a good catch of the crop, and the Johnson grass will not cause a loss of the stand of alfalfa, although it may be very thick and grow to the height of several feet above the alfalfa. The Johnson grass will almost disappear after the third year on heavy alfalfa land. This combination is especially good for forage production, the mixture making a hay that is superior for work stock to either one of the plants alone. More than seven tons per acre of this crop have been harvested. Johnson grass will constitute the major portion of the last three cuttings. With the heavy growth made by these crops they can be handled to advantage in the silo when the weather is unsuited to the making of hay, as has been mentioned above.

Johnson Grass and the Clovers.—Since the clovers are winter and early spring crops, they grow splendidly on Johnson grass land and die down before the season for the grass to grow. A very good practice with them is to graze the clover till about June 1 and then take the cattle off and cut the grass for hay during the remainder of the season. The grass is always much improved in the vigor of its growth by this treatment, due to the fertilizing effects of the legumes. Red clover does well with the grass and can be cut with it for hay, the two making as good a combination as Timothy and clover in the North. This combination, too, should sometimes be put in silo in preference to making hay of it. One Louisiana planter has filled his silo during the past summer with this crop.

A watery rot of citrus fruit which became serious in California last year for the first time, mostly on long stored lemons, is being studied by Prof. C. O. Smith of the University Pathological Laboratory at Whittier. Its name is Oospora citri-aranthii.

GET RID OF THE GOPHER BY USING EFFICIENT TRAPS

Mr. J. Sexton, Santa Barbara Co., Cal., says: "I have tried many gopher traps in the past 48 years in Southern California, but I find the Ideal one of the best on the market. Enclosed find check to pay for one dozen more Ideal Traps. I will distribute them to those who want to exterminate a bad pest."

Mr. John H. Lambert, Lassen Co., Cal., in reordering says: "I received the seven traps I ordered from you a few days ago. I have tried them but a little so far, but I believe that they are going to be all right. Please send by prepaid parcels post one dozen more of the Ideal Gopher Traps. Enclosed find my check."

Mr. John Munz, Los Angeles Co., Cal, says: "Send me two dozen more of the Ideal Gopher Traps. I like them better all the time."

Mr. E. L. Morey, Contra Costa Co., Cal., writes: "Enclosed you will find stamps for which please send me one of your Ideal Gopher Traps. Mr. Pigott says that the trap he bought is the best he ever saw."

Mr. Ben E. Gilmore, San Joaquin Co., Cal., writes: "I have used several different traps, but I find the Chubbuck Ideal Gopher Trap the best thing in the trap line. I caught two gophers the first afternoon I used it. I would highly recommend it to anyone in search of a gopher trap."

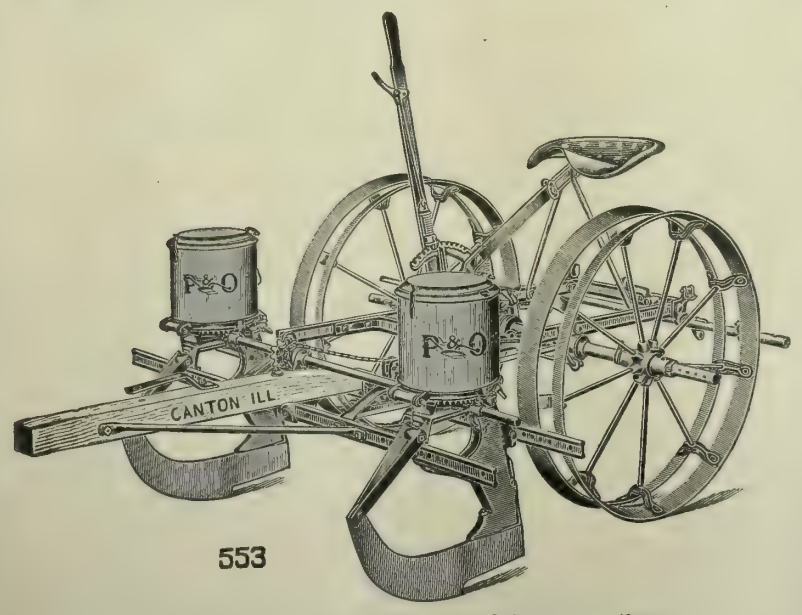
E. J. Chubbuck Co., Gentlemen: The gopher trap you mailed us Jan. 22d has proven a success according to one of the ranchers. He claims to have set it seven times and caught seven gophers. It is impossible for a trap to do more. * * * Express three dozen Ideal Traps at once as this is the best time to trap this pest. Expect our next order will be for one gross.—El Paso Seed Co., El Paso, Texas, Feb 11, 1916. (March 6, 1916, the El Paso Seed Co. sent in their order for one gross Ideal Traps.)

The trap guaranteed to catch small or large pocket gopher. Being round with thin edges, gopher walks into trap before detecting anything in runway. 100 per cent efficient—catches gopher every time. Far safer and surer than poisons or gas. Farmers say it's worth dozen other makes. PRICE, 50c. If your dealer can't supply you, will send it, postpaid: two traps, 95c; six traps, $2.70; twelve traps, $5.10. Money back if not satisfied. Read the letters above and below.

Mr. J. B. Burrell, Santa Clara Co., Cal., comes back this way: "Please send me six more Ideal Gopher Traps. They are far the best traps I have ever seen."

Mr. H. G. Daniels, San Bernardino Co., Cal., says: "Practically every rancher in this district is using the Ideal Gopher Trap with perfect satisfaction, and we consider the trap superior to any we have ever seen."

Mr. J. E. Thorpe, San Joaquin Co., Cal., says: "Your Ideal Gopher Trap was given a thorough trial on a huge gopher that I could not get with other traps. I used your trap as directed, and to my agreeable surprise, caught the big fellow the first time. I have used it since with equal success."



Mr. J. F. Botts, San Luis Obispo Co., Cal., says: "Herewith find order for two more Ideal Gopher Traps for my neighbor. These seem to be the proper things for the rodents."

Mr. W. N. Cummings, Orange Co., Cal.: "Enclosed find another check (supplementing the one sent Dec. 2d.) for two more of your Ideal Gopher Traps. I intend to introduce this trap to some orange growing friends at Christmas."

Mr. J. P. Atwood, Contra Costa Co., Cal., has this to say: "I am more than pleased with your traps. In about one hour after I received the traps I had the first gopher, and the next day I caught three. I can certainly recommend the Ideal. I have used several kinds, but this is the best of any."

E. J. CHUBBUCK CO., DEPT. B, 731 MARKET ST., SAN FRANCISCO, CAL.

P. & O. No. 40 Combined Corn and Bean Planter

Furnished with open center or solid concave tires.

The Combined Corn and Bean Planter here illustrated is a machine built by one of the largest manufacturers of planters in the world, particularly to meet the requirements of the Pacific Coast trade.

It is not a made-over machine but is built from the ground up for Coast needs. This fact, together with the reputation of the P. & O. Company for building tools right in every detail. insures absolute satisfaction to every user of this planter.

It's the Way They are Built

FEATURES:

Equipped with a full set of plates for planting any of the different kinds of corn or beans commonly planted in California, including Egyptian and Kaffir corn.

Adjustable to any width rows from 28 to 44 inch. The check rower machine is adjustable for checking rows 3 ft. 4 in., 3 ft. 6 in., and 3 ft. 8 in.

Accurate planting insured by the sight feed. Sight feed has a large opening, and the seed is visible at all times to the operator as it drops from the hopper to the upper valve.

Quick, detachable runners held on the shank by one bolt. Easily removed for sharpening.

Write for descriptive circular and address of nearest agent.

General Agricultural Review.

CITRUS AND SEMI-TROPICAL

On March 19th orange growers of Orange Cove, Tulare county, met and formed the Orange Cove Citrus Association, electing J. Frank Wright, president; O. R. Barber, vice-president; and E. M. Sheridan, secretary-treasurer.

Two carloads of bees were recently shipped from an Ogden, Utah, apiary to Porterville, where they will be distributed among the orange groves. It is said that here is a ready market at a high price for California orange honey.

As arranged at the very successful meeting of the California Avocado Association which was held in Los Angeles in October last, another semi-annual convention of the Association and exhibit of avocado trees, fruit and products will take place in Los Angeles on Saturday, April 20th.

At a large mass meeting of the Tulare Protective Association at Lindsay, March 18, it was resolved unanimously that Tulare county stands solid for the 8-to-1 test for all oranges shipped from the county. The few dissenters, who would unfairly spoil the market for all the rest by shipping sour oranges, kept quiet, with one exception. At a previous meeting in Porterville the proposition had been made that after December 10th all fruit that was 80 per cent naturally colored might be shipped regardless of the test, but without certificate. The matter was discussed at the much larger Lindsay meeting and effectually killed, according to the Porterville Recorder. B. R. Hart of the U. S. Bureau of Chemistry told the growers that artificial coloring of immature fruit would be more vigorously prosecuted hereafter than ever before. Hobart Webster says that the League is getting growers as well as shippers to avoid sending to market immature oranges. The growers are agreeing not to ship through companies who do not observe the 8-to-1 test.

DECIDUOUS FRUITS.

The few crown galls in C. J. Oswald's peach and apricot orchard near Bakersfield are thoroughly cut out and treated with Bordeaux paste.

Wm. Roser of Colfax recently sold his 510-acre ranch near Orland to F. Laughlin of Merced county, who will plant some of the land to prunes.

This year's plantings of apples and pears in Tehachapi Valley alone are between 150 and 175 acres, according to Horticultural Inspector, L. J. Kanstein.

Nurseryman T. J. True of Lancaster says that if you plant trees already shooting out leaves, clip off the leaves one-quarter to one-half an inch from the trunk.

It is reported that the recent showers did considerable damage to the apricots of the Santa Clara Valley, as well as to the cherry and apricot crops in the Pajaro Valley.

Upwards of 125 acres of currants will fruit this year in the Tehachapi district, according to C. T. McKinnie. There are almost 1000 acres of apples and pears old enough to fruit this season.

Among the planters of about 200,000 apple, pear, almond and apricot trees in Antelope Valley the past winter are John Meader, 40 acres; Sierra Madre ranch, 7 acres; E. T. Earl, 150 acres; and D. H. Graham, 40 acres.

About 600 acres are being set out to fruit in Contra Costa county this spring, mostly to almonds, prunes, and cherries. This acreage is almost an average planting, and is scattered in small tracts over the county.

This year's fruit prospects in the Tehachapi district were blighted by a cold snow storm followed by an entire night of freezing, March 24. The harm was done because previous unseasonably hot weather had started the blossoms to opening.

According to L. H. Day, county horticultural commissioner of San Benito county, rot has seriously damaged the apricot crop of that county this season; he places an estimate on this year's crop at 40 per cent of normal.

W. H. Nixon, of the plant pathology division of the University of California, in company with County Horticultural Commissioner of Kings county, recently visited the apricot orchards of that county to investigate the reported damage by rot.

It is feared that the apricot crop of Riverside county will be a very small one this season on account of the recent hot spell. An Orange county grower estimates the apricot crop of that county at only 50 per cent of the normal crop.

A meeting of pear growers was held at Courtland on March 22, to consider the organization of a State-wide pear growers' association. The meeting was addressed by State Market Director Harris Weinstock, who urged upon the growers the necessity of such an organization.

At a recent meeting of the growers of Woodlake, Tulare county, it was decided to operate a co-operative cannery this season to handle the fruit, vegetables, and olives grown in that section. It will be known as the Woodlake Valley Co-operative Cannery, and will be affiliated with the California Growers' Association.

General Manager Vernon Campbell of the California Growers' Association recently returned from the South where he assisted in organizing locals of the Association. He has now left for Butte county to perform the same duties there; and it is hoped in time to make the efforts of the Association State-wide.

Bankers and business men of Selma recently offered to subscribe $100,000 to the California Peach Growers' Company if the company's headquarters would be established there. Now the leading citizens of Fresno (where the temporary office is located) have gotten together and will make a fight to have the office remain there.

Sometime in June, a meeting of apple growers of Humboldt county will be held for the purpose of organizing to place the industry in that county on a profitable and standardized basis. Among other things, it is proposed to have a uniform label for Humboldt county apples and otherwise put the industry on the most modern basis.

A canvass of the Beaumont-Banning district for the Peach Growers' Association is being made by A. C. Stower at the instance of J. P. Bolton, who was in Southern California last week in the interests of the Association. Mr. Bolton states that the required 75 per cent of peach acreage has been practically all signed up, but that it will take all of April to finish the $600,000 in subscriptions.

OLIVES AND NUTS.

It is reported that the Durham almond crop was seriously damaged by the frost of last Thursday night.

About 200 acres of olives will have been planted this season around Lerdo and the Kern County Land Co.'s ranch, according to Farm Adviser Carl Williams.

Shipments of walnuts are being made from Carpinteria and Goleta to eastern cities; and there now remain but two cars unshipped of the 1915 crop.

Almond is the most satisfactory root for almonds in the Belleview district of Antelope Valley, according to Fred Godde, though it is much more susceptible than peach to crown gall and root knot.

The Hemet Walnut Growers' Association, which incorporated March 13 with 225 acres signed up the night of organization, have over 500 acres signed up and have affiliated with the California Walnut Growers' Association.

He'll Make You Poor — KILL HIM

What is the use of preparing a good seed bed and planting seed that cost good money if you let squirrels and gophers eat your profits. These pests are a constant danger to crops and a constant menace to the family's health.

Carbon Bisulphide

has for over 30 years proven to be the most effective—the only sure killer of squirrels, gophers, rats, prairie dogs, ants, moles, yellow jackets, moths, weevils, lice, etc. It is easy and safe to use.

Centerville, Iowa
From Iowa

After considerable argument and debate, the Guinda Almond Growers' Association has withdrawn the local unit from the State Almond Growers' Association. The wisdom of the action remains to be seen in the selling of this year's crop.

At a recent meeting of the California Olive Association held at San Diego, grades and labels for packing olives were decided on; and after conferring with State officials, members of the Association formally declared what should constitute mature fruit, and only fruit coming up to the required standard will be bought from the growers for packing.

As a result of the action on the part of the Guinda Almond Growers' Association in withdrawing from the State Association, an opposition body was formed shortly after, to be known as the Rumsey and District Almond Growers' Association. This association will affiliate with the State Association and has for its members many growers who have never before belonged to any co-operative marketing body, as well as members of the Guinda Association who were not in favor of the withdrawal.

GRAIN AND FIELD CROPS.

Sugar beet acreage in Kern county has nearly doubled this year, to 2000 acres.

Grain in Kern and Tulare counties has fine color and is generally knee deep, good stand, and upright.

It is reported that over 2000 acres of new land will be seeded to alfalfa this month in the Oakdale district.

F. M. Barney of Hanford reports that he made his first cutting of alfalfa on March 14, an extremely early cutting for alfalfa.

The first car of asparagus shipped from the delta regions brought $4000 in New York, selling readily for $4 to $14 per dozen bunches.

Lima bean growers of Ventura county have now formally organized themselves under the name of the California Lima Bean Growers' Association, with Oxnard as the principal place of business.

The first car of green peas ever shipped from California to the Atlantic Coast was sent from Brawley recently, and was reported to have reached there safely and to have sold for good prices.

It is reported that the Turlock Melon Growers' Association is greatly pleased with the result of the association marketing of the past year. The crop comes in just at the close of the Imperial Valley crop, and dealers of New York, Boston, etc., say they will be able to do better in the way of sales this coming season.

Though soil analyses showed no need of lime, C. J. Oswald of the Kern Mesa colony has a very distinctly better growth of cabbage between two rows of a peach orchard 330 feet long where he applied 18 or 20 pounds of lime, than in the next "middle" treated otherwise exactly the same. He will lime the rest this year if he can.

The heavy, cold rain last week did considerable damage to the newly planted cantaloupes in the Turlock district; many are replanting. The rain, however, was a great benefit to the growing grain. E. W. Crow, who farms 5000 acres of the Hickman ranch, says that it will insure a big crop for the whole East San Joaquin Valley. No damage was done by the light frost throughout the county.

On account of the quarantine in Oregon practically barring the shipment of California potatoes to the northern markets, the Wholesale Potato Dealers' Association has appealed to Gov. Johnson to assist them in paving the way for a resumption of the northern business. P. E. Platt has been designated as a representative to go to Oregon and present the case to the proper authorities.

S. Spyres, who lives about six miles east of Modesto, had splendid results last season with dent corn. He averaged nearly 20 tons of corn to the acre, and says that a great many stalks had three or four large ears of corn, and some grew nearly 15 feet tall. He had cut a heavy crop of oat hay early in June, then gave the ground a good, thorough soaking. He plowed about ten inches deep and got a good seed bed. By going through the corn every week with a cultivator, he kept a good mulch on top, and succeeded in getting his corn through with one irrigation. He believes that it should be allowed to get pretty well matured before cutting

MISCELLANEOUS.

At the recent jack rabbit drive held by South San Joaquin farmers, about 4,000 rabbits met their fate.

The freeze that struck Placer county the night of March 23 did considerable damage to the fruits, strawberries, and vegetables in the lowlands. The highlands and hillsides were not hurt to any material extent. One-half inch of ice is reported in some places.

A Farmers' Institute was held on March 24 at Rolinda, Fresno county; and pruning, poultry raising, and marketing were among the subjects under discussion.

The Railroad Commission recently denied the application of the Southern Pacific Company to change the rules and regulations concerning shipments in refrigerator cars. It is claimed that had these changes been allowed it would have meant a raise in the charges from $5 to $10 per car to certain California points.

Luther Cunningham of Morgan Hill, inventor and manufacturer of the well-known and extensively used pulverizer, packer, and mulcher by that name, has transferred his business to the Spalding-Robbins Disc Plow Co. of San Francisco, who will manufacture and add same to their line of farm implements, and in future act as exclusive agents.

Van Brunt Drills
With Adjustable Gate Force Feed

THEY plant any small seed, alfalfa to bearded oats, peas or beans.

Amount sown per acre easily regulated merely by shifting feed gauge levers.

All the ground sown, because the Van Brunt adjustable gate force feed and special agitator in the hopper compel seed to leave hopper in even, continuous streams—no bunching or choking up—and an equal amount goes into each furrow.

An even stand of grain is secured, because pressure springs compel all the discs to cut furrows of even depth, and the closed delivery places seed at bottom of these furrows.

Van Brunt Drills do not clog up. Scrapers keep discs absolutely clean.

Smooth running—each wheel drives half the feeds, equally distributing the work. A direct, double, gear drive from the continuous axle.

High grade discs with bearings that are guaranteed to last lifetime of drill. Either single or double discs.

Grass seeder attachment can be furnished which will drill or sow broadcast as desired. Write us for free booklets.

John Deere Disc Plows for Tractors
For Field or Orchard

MADE especially for use in the West. Work successfully in every soil where a disc plow should be used.

Plow anywhere from five to twelve inches deep.

One-man outfits—controlled by man on the tractor. Work with any standard tractor.

Can be used either for field or orchard work simply by changing the land axle.

All levers down close to plow when at work—plow can be operated close to trees and under limbs without injuring them.

Easily transported—special lever at the rear for lifting discs high and level.

Over fifteen inches clearance under beam; twenty inches between discs.

Twenty-four or twenty-six-inch discs with chilled metal bearings—constructed so that bearings do not drag along wall of furrow when plowing deep.

Can be reduced to four discs by taking off one intermediate section and telescoping connecting rods.

Write for free booklets describing the John Deere Tractor Disc Plow No. 10 for field work and No. 11 for orchard and vineyard.

John Deere Plows for Light Tractors
For Orchards and Vineyards

PRACTICAL—one-man outfits. Work with any standard tractor. Controlled by man on the tractor.

High and Level Lift—Pull the rope and all bottoms raise high and level. Another pull lets them down. Plows do not clog or gather trash on the turn.

No levers—plows leveled and depth regulated by screw device. Can be run close to trees and vines without injuring branches.

Regular with three or four 12-inch bottoms. Quick Detachable Shares—save 80% time changing shares. Write for free booklet describing light tractor plows for orchard and vineyard, or regular field work.

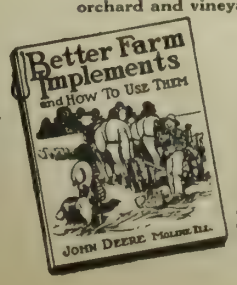
John Deere Syracuse Plows
The Plows with Perfect Fitting Parts

SYRACUSE chilled shares fit perfectly—extra shares go on easily. Share draws up snugly to its place—a smooth joint formed always.

Syracuse 601 Series, wood beam, sloping landside plows are superior for general purpose work in light soils—the 16 Series, wood beam, with side shifting clevis, for hillside work.

Syracuse J-gang plows, three bottoms, are especially satisfactory for vineyard and orchard work.

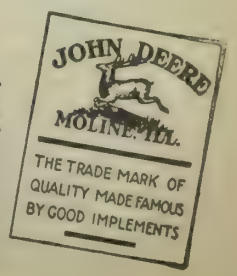
Write for free booklets. Also ask about Syracuse non-cloggable spring tooth harrows.



R. & V. Engines
Dependable Farm Power

"R & V" Triumph—always develops rated horse power—made in 1, 1½, 2½, 4, 6, 8, 10, 12, 16 and 20 H. P. sizes, stationary and portable.

Easily started; perfect speed control (speed can be varied 40 per cent without stopping engine). Complies with insurance regulations. Hopper cooled—a simple, efficient system that does not require long pipes and numerous fittings.



High grade throughout. Inspect the extra guard ring over piston pin to prevent possibility of scoring cylinder. Ask about the "R & V" oscillating magneto. Write for free booklet.

John Deere Dealers Everywhere

Better Farm Implements and How to Use Them

BOOK FREE—168 page reference book—tells all about a complete line of farm implements and how to adjust and use many of them. A practical encyclopedia of farm implements. Worth dollars. Describes and illustrates: Plows for Light Tractors; Steel and Chilled Walking and Riding Plows; Disc Plows; Cultivators; Spring Tooth and Spike Tooth Harrows; Lister Plows and Cultivators; Disc Harrows; Alfalfa and Beet Tools; Farm and Mountain Wagons; Teaming Gears; Manure Spreaders; Inside Cup and Portable Grain Elevators; Corn Shellers; Hay Loaders, Stackers, Sweep Rakes, Mowers, Self-Dump Sulky and Side Delivery Rakes; Hay Presses; Kaffir Headers; Grain Drills and Seeders; Grain Binders; Corn Binders; Gasoline Engines. This book sent free to every one who states what special implements he is interested in and asks for Package No. K-152

John Deere, Moline, Illinois

Mechanical Power on the Farm.

THE SLEEVE-VALVE MOTOR.

[Written for Pacific Rural Press by W. M. Findley.]

Motor car owners and prospective motor car owners are showing great interest in the Knight type sleeve-valve motor. This is due to the fact that this type of motor has recently been adopted for use in cars of moderate price.

There are four main differences between this motor and other motors in common use. These differences consist of the valves; the shape of the combustion chamber which is spherical; the location of the spark plug directly over the piston, and the machining of all surfaces forming the combustion chamber.

The sleeve-valves, which form the distinguishing feature of this motor, are two round shells of cast iron which slide up and down between the cylinder wall and the piston—one working within the other. The explosion takes place within these sleeves. Fresh gas is admitted to the explosion chamber, and exhaust or "dead" gas is expelled, through ports or openings cut into the sleeves at opposite sides, near the top. As the sleeves slide up and down, these ports come together and large openings are formed through which gas has free and unobstructed passage into and out of the explosion chamber.

The sleeves are raised and lowered by connecting rods from an eccentric shaft that is operated from the crankshaft. The timing of the opening and closing of the valves cannot vary. Cams and springs have been entirely eliminated, consequently adjustments are never required.

Compression does not depend on the fit of the sleeves to each other and as any carbon that lodges on the sleeves makes them run more smoothly, valve grinding is never necessary.

Simplicity is an outstanding characteristic of this motor. It has no intricate small parts, and the valve mechanism is entirely confined within the motor itself.

SUBSOILING FOUR FEET DEEP.

[Written for Pacific Rural Press.]

Giant subsoilers, to loosen, drain and aerate the soil four feet deep without bringing it to the surface where it would have to weather a year before being good for crops, are being built for the American Beet Sugar Co. by the Killefer Mfg. Co. The seventh one was recently completed, to be hauled by 75 h.p. Best and Holt tractors.

The subsoil aeration is accomplished largely by a 50-pound "gopher" which is attached by chain links to the subsoiler shoe. It is a sort of conical hollow iron 15 inches long and eight inches across its base. Mr. Killefer says he has known similar "gopher" holes to remain open three years.

The subsoiler is fixed in a heavy channel-and-angle iron frame on two low broad iron wheels. The cutting blade, well over four feet long, is raised and lowered in the center of the frame behind the wheels, by a cog or cable and big hand-wheel arrangement. It is held in place and pulled by a double channel iron from its top end to the front of the frame, where it is pivoted to allow raising and lowering of the subsoiler.

On the lower end of the cutting blade is a flat toolsteel shoe 3½ inches wide and 14 inches long, which runs about horizontally through the ground and pulls the gopher. This shoe may be tilted to run deeper, level, or shallower (upward) by a wheel and cog arrangement at the top of the cutting blade.

"I believe in opening the subsoil for drainage and aeration every 12 to 25 feet," says Mr. Killefer, "for increased crops on land that is at all heavy underneath show its value; but I don't believe in plowing too deeply until the subsoil has weathered. It is usually dead and won't raise crops the first year it is turned up even in California.

Horse Tools too Light for Tractor.—"Moreover, horse tools are not good for tractors. They get torn to pieces because they are not built strong enough. We have sold 54 gang plows to the sugar companies. We tried at first to build them for $250, but they tore to pieces and we had to put heavier material in them; so that now the sugar companies are paying over twice that much and are well pleased."

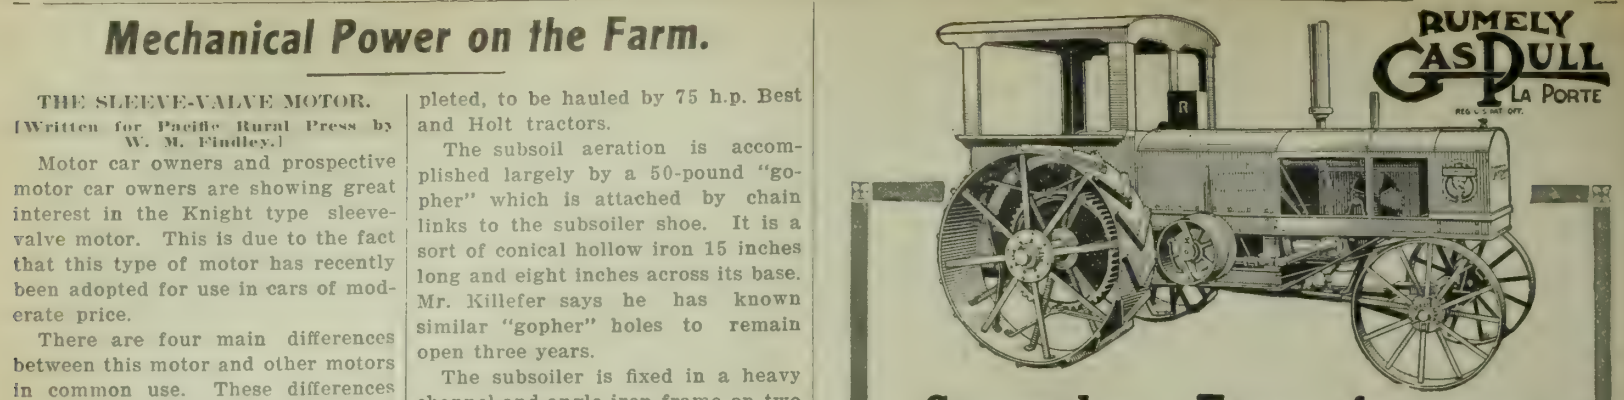
TRACTOR ON PLOWED GROUND.

[Written for Pacific Rural Press.]

Pulling a double 8-foot disk over ground plowed a week before, J. B. Lash, working for Mrs. E. E. Chapman in San Fernando valley, was putting the seed bed in first-class shape for beets, using a 35-16 Sandusky round-wheel tractor.

Nearby was a man harrowing with four big mules. "I've pulled a disk and a harrow like that man is using. The tractor has been run 48 hours steady without getting the cylinder jacket very hot."

A boy had been running the day shift while Mr. Lash ran the night shift. In the month that tractor had been in the valley, Mr. Lash claims to have plowed 130 acres over 12 inches deep, disked and harrowed 140 arces, and plowed and harrowed 20 acres of grain land.



Two fourteen-inch Oliver chilled plows were run over a foot deep and a harrow was hooked on to run on the soft ground beside them so that the draft equalled three bottoms.

ROUTING RUST.

This Age of Steel has roused a world-wide battle with rust, and more chemists and other experts are studying possible weapons for this battle than are busy on almost any other industrial problem. Concrete owes much of its present growth to the difficulty of protecting steel and iron against rust.

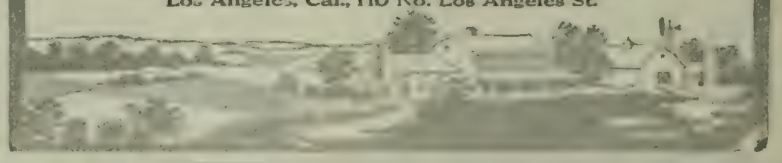
Absolutely pure iron will not rust and fairly pure iron will rust only slowly. One way, therefore, is to improve the grade of iron; and manufacturers now sell iron that is guaranteed to withstand rust for considerable periods. It is possible, though expensive, to purify iron completely by electricity; and electrolytic iron, as it is called, may before long be common commercially.

Surface coats of protection are, however, the favorite methods of today; and many such coatings have appeared lately. The latest one is a metal coat that can be applied on an iron or steel structure after it has been erected, in much the same way that paint is applied. Finely powdered metals—such as tin, lead or zinc, or all three in proper proportion—are mixed in oil and painted

Strengthens Every Argument

ALL that can be said for tractor farming is made stronger by the GasPull. It adds handiness to power, convenience to durability, simplicity to economy. And on top of that it is low priced.

The handiness and light weight of the GasPull are big features. It weighs only 11,000 pounds and will turn on a 15-foot circle. It can be equipped for speeds from 2 to 3½ miles per hour.



Nothing that would add to its convenience or reliability has been overlooked—all controlling levers are conveniently located and it is equipped with a safety cranking device and a dependable foot brake.

The motor is powerful and smooth running, the lubricating system is efficient, and all working parts are well protected from dirt and the weather.

You can count on the GasPull to handle all your power jobs—15 horsepower on the draw-bar and 30 horsepower on the belt—and no tractor is more conservatively rated. Write for a catalog and prices.

Advance-Rumely lines include the famous OilPull tractor, Rumely traction plows and the new All Purpose small farm tractor, threshers, steam engines, hullers and huskers—all dependable machines and backed by Advance-Rumely service.

on the bridge or column or other structure that needs protection. Then the painted surface is heated by a hand torch or in whatever way is most convenient.

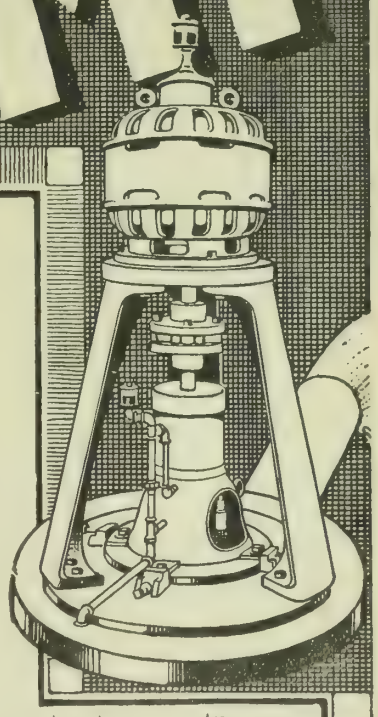
The oil burns away and the powdered metal melts, but does not run. As the metal cools it takes a tight grip on the iron surface and forms a tin or alloy coat, which stops rust. —Saturday Evening Post.

AUTO RUNS HORSE CLIPPER.

[Written for Pacific Rural Press.]

An automobile horse-clipping outfit is touring the State. It was finished at Downey, Los Angeles county, recently for its designer, Art Florey.

An X-braced 1x3 frame about 4x6 feet is hung to the rear axle of a small automobile by clevises so it can be raised or lowered at will. Its rear end is held up by a heavy wire hook to the upper part of the back seat.



A piece of small shafting is set in loose boxings with old cam shaft bearings. On one end of the shaft and just outside the frame is a 4-inch pulley wheel. On the other end is another, and beyond this is a solid wooden contact wheel about 16 inches in diameter and on the same shaft. This is rubber-tired, using strips from an old auto tire. When the left rear wheel of the auto is jacked up and the right wheel blocked, this contact wheel is let down against the auto tire and it runs the clipping machinery. It is held against the auto wheel by two or three springs attached to the frame and to the boxing on the left end of the shaft. This boxing slides a few inches back and forth in a sort of cage on the frame. When the clippers are not in use, a lever connected by a wire to the boxing pulls against the springs and is simply hooked over a block nailed to the frame to hold the contact wheel free from the auto.

The pulleys on the shaft run small belts to similar pulleys on the outer corners of the frame. These have fixed vertical axles about 16 inches long, each of which extends downward into a flexible tube through the short piece of pipe by which they are fastened to the frame. Their lower ends are fastened to chains which extend through the tubes and run the clippers. The chains are made of steel wire of No. 8 diameter in links about 1½ inches long. The links are simply pieces of the wire with both ends bent so as to become eyelets. The tubes are canvas and rubber with a spiral metal lining and are eight or ten feet long.

Acrobatic.—Smart Young Man—"What do you think of Brown?" Indignant Old Gentleman — "Brown, sir! He is one of those people that pat you on the back before your face, and hit you in the eye behind your back!"—Tit-Bits.

California Ripe Olive Day will be celebrated this year on May 16.

Layne & Bowler PUMP

No matter whether you desire to develop only five inches of water at a very slight lift or 10,000 gallons per minute at a 1000 foot lift, we have a pump that will meet your particular requirements. Let us give you an estimate, either for installing your complete pumping system or just the pump alone.

"Let the World's largest water developers solve your pumping problems."

A Better Make Not Made

For Water Deep Under The Ground

Jackson Deep Well Turbine Pumps give continuous and efficient service. They do not get out of order as they have no valves or plunger rods. Very little care or attention needed as they are oiled from the surface. Are much lower in cost than other types of deep well pumps when the expense of dug pits, cribbing and timbering is reckoned. They raise water from the very bottom of the well, thus eliminating heavy vacuums and delivering all the water the well yields. They develop slow wells and increase their flow.

Like all Jackson Made Pumps These Deep Well Turbine Pumps Are the Very Best Pumps Made for the Purpose—They are Dividend Earners, Not Expense Makers

Whatever your water problems may be our Expert Pumping Engineers will help you out free of charge—write

THE SUPPLY OF GRAIN BAGS.

In so far as the supply of grain bags for this year's crop of grain in California is concerned, the California farmer has no reason to worry. This is due to the fact that crops in this State are earlier than in other Pacific Coast States.

At present there are sufficient bags to take care of the California crop, consumption here being 20 to 25 million bags annually, and between the output of domestic manufacturers, the prison and supplies brought from Calcutta the required number of bags are in sight.

Although last year's consumption of bags on the Pacific Coast was exceptionally large, it cannot be used as a criterion this year, as they were used for many purposes which present high prices forbid. Moreover, estimates recently made indicate that the grain crop will be about 25 per cent less in 1916 than in 1915.

The present high prices are due to the fact that the Allies are using 50 million sacks per month, taxing the capacity of the mills.

Alfalfa Growing as a Specialty.

(Continued from page 409.)

was run over it when weeds an inch tall could be found. Mr. Woodward says a weeder and mulcher which stirs a blanket of soil while it cuts the weeds would be better.

By fall the seed bed had become firm. It was spiketoothed, the seed broadcasted and spiked in by two or three harrowings.

After it came up it seemed to stand still awhile, with only a few leaves. Plants pulled up with only four leaves revealed eight inches of roots—getting a foundation. Then it shot ahead into the astonishing first year's crop mentioned.

Irrigation and Cultivation.—"We irrigate our young alfalfa five or six times per cutting; old alfalfa needs only two irrigations per cutting because it has spread out to protect the ground more. Also the roots of old alfalfa have opened up the ground so it takes a great deal more water than young plantings," says Mr. Woodward, speaking from experience with other alfalfa, grown nearby for a decade before their present 80 was planted.

"At first the water would flow across the half-mile checks in two hours; wind and sun would have baked the surface soil—then the moisture would have evaporated and not enough would have been left to grow the crops we grow. To help avoid this, we did run a spike-tooth harrow over the alfalfa after every cutting of the first year. It cultivates the ground without uprooting alfalfa, for we need a perfect stand with no weeds."

The soil has now changed so that it remains "soft and pliable." The second year it took perhaps 10 hours to run water from one end to the other by the system used, which is described farther on in this article. He gives the alfalfa, not half the water it wants, but all it wants.

The borders grow as good a crop as the checks, because the borders are small enough for the water to soak through, and because the hay rakes give them extra cultivation.

There are four lines of steel underground pipe equidistant crosswise of the 80, and all are supplied by a line from the pump alongside the field. On each line in each check, a 10-inch heavy galvanized iron vertical outlet pipe overflows direct onto the ground. A smaller vertical pipe and faucet are provided beside the white board which locates the outlet, so the haymakers always have fresh water handy.

Beginning irrigation, the cap is taken from the outlet at the upper end of a check and the pump shoots 100 inches of water through it. A head of 50 inches by pump or reservoir should be the minimum for 33-foot checks. By the time the water has reached the next outlet below, it is opened, and being 5 feet lower, lets all the water through it. When all four sections of a check are wet and the water is near the lower end, these outlets are closed and the one at the head of the next check opened. No water is allowed to stand anywhere. It drains naturally toward the well at center of the lower end.

A cultivator was made not long ago by having the blacksmith roll the edges of four or five inches of the points of spring harrow teeth backward and pound them to a point about like a spike harrow. However, a neighbor has had pieces of curved hayrake teeth welded onto spring harrow teeth, curving forward so they dig under and ahead. This sort of a cultivator will be used next year on the Woodward ranch.

How the hay is harvested will be told elsewhere.

A TEXAN PLAN OF SUMMER SOWING ALFALFA.

To the Editor: I am much interested in your note in regard to summer seeding of alfalfa on irrigated land in the issue of March 11th. In this country we have secured excellent results by cultivating the seed in lightly, between rows of cotton, in the month of August. Cotton gives sufficient shade to justify planting in hot weather and the first frost leaves the ground practically free to the alfalfa, with the advantage of its having time to become deeply rooted before winter.

If your correspondent at Turlock does not grow cotton he might possibly find some other crop that would have these advantages and thus enjoy the benefit of very early planting. **Willard H. Denis.**

Buena Vista, Texas.

A COUNTRY LOAN DEPARTMENT.

The Savings Union Bank & Trust Co. of San Francisco is installing a country loan department, of which V. C. Bryant, formerly of the Agricultural Department of the University of California, will have charge. He assures us that it is to be the policy of the Country Loan Department to be of as much actual service to the farmers of the State as possible. Their rate of interest is seven per cent and they expect to consider any sized loan. Mr. Bryant's acquaintance with the agricultural conditions of the State makes him especially well fitted for his new undertaking. He states that his principal problem is to get before the farmers of the State the fact that a country loan department is coming into existence.

An active campaign is being carried on in Fresno county for the purpose of securing a farm adviser. Meetings are being held at all points where it is probable bureaus will be located.

Mr. V. C. Bryant of the Savings Union Bank and Trust Company of San Francisco, formerly with the Agricultural Department of the University of California, expects to visit the various agricultural localities of the state, in connection with his new duties, for the purpose of determining loaning values.

Anyone desiring information as to when he will be in any particular locality should address him, care of The Savings Union Bank and Trust Company of San Francisco.

MISCELLANEOUS.

EVERY SIZE WROUGHT IRON WATER PIPE and screw casing water pipe, guaranteed as good as new. Prices right. Send for catalogue. We beat no one; everybody gets a SQUARE DEAL. Weissbaum Pipe Works, 160 Eleventh Street, San Francisco.

GAS ENGINES—I can furnish rebuilt Fairbanks Morse, Otto, Peerless, Samson, Union and other good makes in al sizes. All investigators buy and all buyers are delighted. Pay when satisfied. J. J. Pottinger, 189 2nd St., San Francisco.

ORDER YOUR PRINTING NOW before prices are raised; paper is advancing and printing will soon cost you more; get my prices and save money. Mail orders a specialty. G. C. Gallagher, The Service Printer, 309 Battery St., S. F.

FOR SALE—10 head young, well-broken mules, average weight about 1100 lbs. For particulars enquire Valley Farm & Stock Co., 149 New Montgomery St., San Francisco. Phone Kearny 2735.

FOR SALE—Used Ranch Tools, Windmills, pumps, engines, new galvanized tanks; 1000, $22.50; 2000 $32 50; guaranteed. Save half. Demmitt Company, 120 North Main, Los Angeles.

"SMITHS' PAYS THE FREIGHT."—To reduce the high cost of living, send for our Wholesale to Consumer Catalog. SMITHS' CASH STORE, 106 Clay St., San Francisco.

BUY ROASTED COFFEE WHOLESALE—Best, 10 pounds $3.00 delivered. Order with remittance. WM. J. SCHMIDT, CO., 112-B Market St., San Francisco.

LIVING EXPENSES REDUCED THROUGH CO-OPERATIVE BUYING—Write for catalogue and particulars. Pacific Co-operative League, D236 Commercial St., S. F.

PATENTS THAT PROTECT are procured through Pacific Coast Patent Agency. Savings and Loan Building, Stockton, California. Established fifty years.

SECOND-HAND WATER PIPE and Screw Casing. New threads and couplings dipped in hot asphaltum. All guaranteed. Send us your inquiry. SHELTER PIPE WORKS, 306-8 Howard St., San Francisco.

APPLES!—Buy direct from producer. Newtowns, 90c; Bulk pack, 4 and 4½ tiers, equal proportion. No 2 grade for cooking, 65c. In 5 box lots 70c and 50c per box. Edwd. A. Hall, Watsonville, Cal.

IRRIGATION EQUIPMENT—For pumps, oil engines, gas engines, friction clutch pulleys, etc., write us. We can save you money. Commercial Iron Works, 481-497 Fifth St., San Francisco.

CONCRETE MIXERS—2 brand-new mixers at manufacturers prices. Write at once. Commercial Iron Works, 481-497 Fifth St., San Francisco.

ONE 45 H. P. and one 20 H. P. I. H. C. traction engine for sale, cheap. Will trade for stock. B. T. Brewster, Box 466, Davis, Cal.

TREES AND PLANTS.

WALNUT TREES — Late blight-resisting varieties grafted and budded on California Black and on FIRST GENERATION Royal and Paradox Hybrid roots, which are as much superior to the California black root as the California black root is to the English root—Eureka, Franquette, Mayette, Neff's Prolific, Concord and Placentia. Dr. W. W. Fitzgerald, Elks' Building, Stockton, Cal.

30,000 CITRUS TREES—Navels and Valencias—27½c. delivered at your depot, anywhere in California, packed in moss, bare root lots of 500 and up; or 37½c in 35-lb balls in 10-acre plantings. All big two-year-old stock; choicest ever produced by anybody, anywhere, at any price. Samples sent free on request. Lem A. Brunson, 1120 Haas Bldg., Los Angeles. Phone F 4003.

EUREKA WALNUTS ARE THE BEST.—Grafted on native black roots. Our prices will surprise you. Write today—tomorrow never comes. Gever Bros., Walnut Nursery, 214 S. Alamansor St., Alhambra, Cal.

FOR SALE—Spineless Cactus Plants. Prices right. B. C. Engbert, Byron, Cal.

FRUIT AND ORNAMENTAL TREES and all kinds nursery stock, especially suited to Central and Southern California conditions. Buy from a responsible firm. Lawn Nurseries, Box 418, Sacramento.

WILLSON'S WONDER and genuine Franquette trees; grafting wood for sale. Write for circular and price. Encinal Nurseries, F. C. Willson, Prop., Sunnyvale, Santa Clara County, Cal.

NURSERY STOCK—None better. 2-year-old Navel, Valencias and Lemons, ⅝ and up, 25c, balled and packed in moss. Ask for prices on carload lots. J. Johnson, Azusa, Cal.

FOR SALE—Manzanillo Olive Trees, budded on Picholine seedlings. Younger and heavier bearers, better lived and more vigorous trees than trees raised from cuttings. Geo. E. Rice, R. 1, Box 76, Reedley, Cal.

GRAFTED ENGLISH WALNUTS—A few hundred vigorous trees. Two-year-old California Black Walnut roots, one year Concord Walnut graft. Bishop Bros., San Ramon, Cal.

HUSKY TOMATO PLANTS—"Stone" twice transplanted, 5 inch, $1.00 per hundred postpaid. J. F. Swett, Martines, Cal.

SWEET POTATO PLANTS for April and May delivery. California Yams, $2.25 per thousand, 35c per hundred, prepaid. J. Braswell, R. D. No. 2, Lindsay, Cal.

SELECT LOCKEFORD BURBANK—Rural and American Wonder Seed Potatoes. $1.50 per 100. N. H. Lockeford Co., Lockeford, Cal.

FOR SALE—Orange trees from selected two-year-old stock. K. Matsuoka, one mile west of Sanger, Cal.

SEEDS AND BULBS.

CALIFORNIA GROWN SUDAN GRASS SEED—Absolutely free from Johnson Grass or other Weed seed. Price all you can of it; for Broody Chicks and laying Hens stock of any kind you can't beat it. 30 cents per Write for prices on large lots. Lasher's Hatchery, Pot Loma, Calif.

WE BUY ALFALFA SEED containing Dodder, Mustard and other noxious seeds. Send us samples of any bin or low grade seed you may have; also of mustard, bur and sour clover seed, flax, etc. Signed Mercantile & Warehouse Co., Fifth and Poplar Streets, Oakland, Cal.

SEED BEANS—We have choice Red Mexican and Blackeyes grown on sandy land producing a heavy crop. Well cleaned and in good order. Write for prices. THE GRANGE COMPANY, Modesto, California.

SUDAN GRASS SEED—Pure, recleaned, field inspected, officially tested: 10 lbs., $1.50; 25 lbs., $3.00; 50 lbs., $5.00; 100 lbs., $8.00. Satisfaction or money back. B. E. Miller, Carlton, Tex.

SEED BEANS—White Tepary Beans grow without irrigation. 600 to 800 pounds per acre. Write for sample and prices. Robert A. Read, Grower, Delano, Cal.

FOR SALE 300,000 yellow Jersey sweet potato plants. Prices from $2 to 50c per thousand. For information, write Parker Bros., Hemet, Cal.

TEPARY BEAN SEED—Recleaned A No. 1 seed. No better on the market. Also Sudan Grass seed; guaranteed pure. Carl Nelson, Strathmore, Cal.

TEPARY BEANS FOR SALE—Eight cents per pound. Robert Paulsen, Lockewood, Cal.

WANTED.

WANTED—Responsible Representative. 12 tools in 1. Sell to farmers, teamsters, contractors, etc. Lifts tons, hoists, stretches wire, pulls posts. Many other uses. Free sample to active agents. One agent's profit $45 in one day. Another $1000 in Dec. We start you. Write for Big Color Plate. Secure exclusive sale. HARRAH MFG. CO., Box 31, Bloomfield, Ind.

WANTED About sixty young men and women to enter the Western Normal to prepare for teaching, or to secure a high school education in the shortest possible time. Western Normal graduates secure and hold good positions. Time and money saved. For information address Western Normal, J. E. Humphrey, Principal, Stockton, Cal., Box 704.

LAND FOR SALE

FOR SALE—$3500; will sacrifice 160 acres adjoining my home place where I have 75 acres young orchard bearing heavily this year; need proper buildings, dryer trays, etc., to handle crop. Has house, fencing, well, living springs, family orchard, vineyard, abundance rain, fine climate, country rapidly advancing. Nine acres adjoining produced $2600 last year. $2200 this year; ideal for almonds, prunes, etc.; cash talks with me now; absolutely no trade. Carl Dewlaney, Santa Magarita, San Luis Obispo county.

FOR SALE—On account of having land in another State that needs my attention, I will sell my 50-acre dairy ranch located 3½ miles from Modesto, the county seat. Ranch consists of cow barn 64x100, silo, horse barn, 5-room house and other buildings. This place must be seen to be appreciated. Will take back mortgage at 6 per cent for 5 years. Save commission by buying from owner. Write or call or further particulars. D. F. Conant, owner, Route B, Box 231, Modesto, Cal.

FARMS WANTED—We have direct buyers. Don't pay commissions. Write describing property, naming lowest price. We help buyers locate desirable property. Free. American Investment Association, 93 Palace Bldg., Minneapolis, Minn.

116 ACRES AT GRIDLEY, CAL.—All in alfalfa. Abundance of water and shade trees. Splendidly drained. Good improvements. Absolutely right and high-class. Owner, Paul Goodloe, Route 13, box 28, Cupertino, Cal.

WILL EXCHANGE $525 equity in Richmond annex lot. Want cows, stock cattle, hogs, sheep or automobile. Write, Box 45, R. R. No. 2, Woodland, Cal.

A BARGAIN in Olive, Orange, English Walnut trees and Thompson vines at Central Nursery, Route 8, Tulare St., Fresno, Cal. T. Kimura.

Flies Assist in Scientific Breeding.

[By E. B. Babcock.]

Future progress in the improvent of livestock and farm crops ll depend largely on progress in e scientific investigation of the ndamental principles upon which ch improvement must be based. the practical man it may seem a cry from the laboratory study of little fly to an actual increase in lue of a breed of livestock. Yet ch is not the case since the fundaental principles involved are the me for both.

Intensive laboratory study of the mmon vinegar fly has been in ogress for seven years. The eater portion of this work has en done at Columbia University. e California Experiment Station s been following this work for ree years and now has under way me original work with other close- related species of flies. Since be- g subjected to intensive study the negar fly has produced over one ndred new true-breeding varieties the original wild species. By bridization of these varieties with ch other and with wild flies many w facts of importance concerning redity have come to light. Among e more important achievements ade possible by this work are the llowing: (1) complete verification the fundamental theory of Menlism; (2) abundant evidence that x is determined at the moment of rtilization of the egg by the erm; (3) definite knowledge conrning the biological mechanism on which Mendelian heredity dends.

The work with the vinegar fly hich has been going on at the Calirnia Station has yielded results rmonious with those obtained at olumbia University in every parcular. Moreover in a distinct ecies of fly we already have at ast one new variety. It is highly nportant that the heredity of the negar fly be compared with that other animals and with plants.

SELLING MILK BY TEST.

Considering the agitation favorg the selling of market milk by st rather than by the gallon in alifornia cities the following news em sent us by the American Jersey attle Club indicates that progress this respect is even more adanced in Eastern cities.

The account says that the Departent of Health of New York City tends very shortly to enforce an rder which will not permit milk to e sold in New York City which conins less than 8.5 per cent of solids ot fat. The milk companies supplyg New York City have been bringg this rule to the notice of milk isers, and they have been pointing to them the supreme importance taking such steps to improve the uality of their herds as will insure at the average solids not fat will eet the requirements of the Deartment. The consuming public is ecoming very much alive to the mparative nutritive values of the ifferent grades of milk. The prument farmer or dairyman will act acordingly in the selection of his erd. Others will be compelled to llow suit, or be forced out of busiess; for the movement for better milk, or for the grading and pricing of milk on its real food value, is spreading from city to city all over the land.

TILLY ALCARTRA'S NEW WORLD RECORD.

[Written for Pacific Rural Press.]

At eight o'clock Thursday night, March 23, another world's record was made by a California cow when Tilly Alcartra finished her two-year milk record with 60,287 pounds of milk and 2,379.47 pounds of butter, at the ranch of A. W. Morris and Sons in Yolo county.

This beats the previous record made by Riverside Sadie De Kol Burke by 5,469.8 pounds of milk, thus insuring championship honors for Tilly Alcartra for some time to come, both in yearly and two-year milk production.

During the two years she dropped a fine calf and is due to freshen again May 15, 1916, which is considered a noteworthy performance for cows which are being officially tested for two-year records.

This makes the third world's record long distance cow that has been developed on the Morris ranch in the past few years, indicating that the possibilities of California as a purebred State are only just beginning to be demonstrated.

ANTELOPE VALLEY ORGANIZATION.

[Written for Pacific Rural Press.]

The Antelope Valley Swine Breeders' Ass'n was organized Mar. 18 after several meetings held to discuss the matter. Its chief object will be to prevent cholera entering the Valley again. Probably its next most important object is to bring producers together so they can ship to market in carlots. J. K. Miller was elected president; T. J. Hitte, vice-president; Donald H. Graham, secretary; Jack Whitney, treasurer; and F. W. Rich, J. B. Nourse, and Otto Schull the other directors. The first regular monthly meeting will be April 1, at which county veterinarian L. M. Hunt and J. L. Thatcher of Riverside will speak.

A New Head for the Henderson Herd

[Written for Pacific Rural Press.]

The accompanying photograph is that of Supreme Glista Pietje, a beautifully marked and perfectly formed two-year-old bull which has just recently been placed at the head of the Henderson Company's Holstein herd in Sacramento county.

He was bred by E. A. Powell of Syracuse, New York, and selected by the Henderson Company because of his wonderful breeding, as well as being a promising show bull. His dam has a 32.39-pounds butter record while her full sister made 32.65 pounds, and their dam at 10 years old made 31.60 pounds in seven days. The sire of his dam has eight living daughters. Six of these have 30-pound records or better; of the other two, one has lost a quarter and the other is still young. All the above cows are owned by the Cornell University and some of them, it is expected, will soon increase their present records.

The sire of Supreme Glista Pietje comes of the well-known Pietje and Ormsby families. He has 10 A. R. O. daughters and 35 A. R. O. sisters, one of which made 36.60 pounds of butter in seven days. His granddam has a record of 31.62 pounds butter and his sire has 106 A. R. O. sisters.

If the old maxim is true: "Like begets like, or the likeness of some ancestor," certainly the daughters of this bull will do something worthy of special notice.

FEEDING $1.55 BARLEY TO HOGS.

To the Editor: I have about 35 nice young pigs averaging from 50 to 80 pounds each in weight and six to seven and a half months old. They are in good condition and running on alfalfa pasture. Can I afford to pay $1.55 per cwt. for rolled barley and one cent per gallon for buttermilk, feeding them about 40 gallons a day, with pork at seven cents a pound and prospects for an advance in price?—O. F. H., Modesto.

[Yes. When supplemented with alfalfa and buttermilk you should be able to get a hundred pounds gain with 200 to 300 pounds of barley. You can feed about three pounds of buttermilk to one pound of grain and make economical gains. As a young hog is supposed to be able to consume grain up to five per cent of his weight you could feed a ration of two and a half pounds barley and seven and a half pounds of buttermilk daily, together with alfalfa pasture. By feeding this ration you should be able to make 100 pounds gain at a cost of about $5.75 or a trifle less for grain and milk.—Eds.]

The Pasteurization Law and What to Do.

[Address of Geo. W. Ashley, before Farmers' Club at Live Oak Hall, San Joaquin County.]

A. B. 1549, which became chapter 742 of our laws, and which is a law today but does not go into effect until Oct. 1, 1916, is legislation affecting such food products as milk, cream and butter.

All legislation should be carefully drawn, but especially legislation affecting food products. Why? Because your food consumption in these United States is increasing much more rapidly than your food production is increasing. What is called your food consumption class come chiefly from the cities, while your food production class comes chiefly from the country.

In the United States your city population increased in ten years, 40 per cent, your country population in the same time 4 per cent, or ten to one. This alone should give you caution, but when in the same time your total population increased 22 per cent and your total food supply only 2 per cent, or 11 to one, you should be much more cautious. Added to this, in the same ten years on the Pacific Coast, your population increased 100 per cent and your butter supply 60 per cent; also on the Pacific Coast you had in 1870, 339 cows to each 1,000 population; in 1890, 265 cows, and in 1910, 197 cows, a decrease of 142 cows to the 1000 of population, or a decrease of 42 per cent in 40 years, and 26 per cent in the last 20 years of this period.

With these statistics before them, no one having the good of the community as a whole at heart would, unless the need was extraordinarily great, demand the passage of a law affecting these necessary food products, without first being sure it was carefully drawn.

First, then, was the need extraordinarily great? We have in this State a State Dairy Bureau. Did they demand the passage of this law? No, they did not. Next, nearly all of the people who did demand the passage of this bill live in the cities. These cities all have their health departments, and either have or can have regulation governing their milk supply. Their need was not therefore extraordinarily great.

This leaves the question, then, was A. B. 1549 carefully drawn? Does it protect the interests of the consumer, where not already protected, or capable of protection, and does it protect the interest of the producer? We will not at this time take very much time up with the interests of the consumer, for while in the end this law will inevitably increase their cost of living, which many of them will not be able or willing to stand, still they have demanded the passage of this law and they should pay.

As to you, the producer, was there even any attempt by these people to protect you? No. Although it was promised, there is no remuneration even spoken of in the law to cover the loss for the cattle condemned. Nor is there offer of aid in any way for the 50 or 60 per cent of the smaller dairies that will be forced out of business, to many of whom it will mean financial ruin. Neither is there apology for the declaring of all of the milk used by the country people rotten.

Under these conditions, the question for the dairyman to decide is, what is the best course to pursue? Dairy legislation is a very serious question for you; make it serious for the consumer and he will have more regard for what is just and reasonable.

A leaf from the history of the passage of this bill: The various dairymen and dairy committees that came to Sacramento thought from the promises made them, both by those asking for the passage of the bill and also by committee chairmen and members of the legislature, that they (the dairymen) would come through in reasonably good shape. But they saw these promises broken and this legislation put through—legislation based upon what they claimed was the danger to human life from dirty dairies. It is an easy subject to orate upon and one which, just as in this case, the sponsor for the bill needs to know nothing of a dairy to be able to talk about, and with the threat of the "club woman's" vote held over the legislator, secure the passage of a law that is neither reasonable nor just.

The author of A. B. 1549, or rather the sponsor for it, admitted that he never was inside of a dairy, knew nothing of them, or how they were conducted. Yet he was able, with the assistance of many others like him, to secure the passage of this bill! A bill that is in favor of the rich man as against the poor man; a bill that means the practical elimination of all the smaller dairies; a bill that in addition to these, declares that all of the milk that does not comply with these regulations, or practically all of the milk used by the country people, is impure, unwholesome and unfit for human consumption. Let us see just what this last means. From U. S. Agricultural Department statistics, we find that the average amount of milk consumed by the country people of the United States per week is 5¼ gallons per person, while the city person only averages 2 1-3 gallons, or about half as much. Carried still farther, the country people consume about two and one-half billion gallons per year and the city people only a billion gallons. And yet at the request of the smaller user (the city people) the great State of California declares that portion of the food products used by the country people to be rotten and unfit for human consumption.

Now, are the dairyman and the country people going to contend against such legislation? There is no question but what there is need of regulation of the cities' milk supply. The necessity of its passing through many hands, some honest and some not, some cleanly and some not! the tracing, once in a while of disease to this source, show that there is need. This regulation, however, should be reasonable and just and the laws and rules governing it should be drawn by those familiar with dairy conditions, and above all those that demand them should be willing and anxious to pay the added cost.

The costly milking shed in which no hay may be stored, the up-to-date milk house, fly proof, with refrigeration or other plant to cool the milk quickly; weather sheds to keep the cows contented, a high per cent of butter fat, tuberculin tests or pasteurization, so many thousand bacteria to the cubic centimeter, t holding of the milk at a certain te perature, which after it is pa teurized is fixed by law at 50 d grees; all of these cost money. N reasonable person could think the would make the producing cost

Have Consigned Cattle of Great Merit in Order to Make This Truly

90% of the offerings are females and they include cows with records of 27.86 lbs., 23.69 lbs., 22.28 lbs. and 20.68 lbs. of butter in 7 days. Many others with records up to 20 lbs. of butter in 7 days. There will be daughters of these cows sired by such great sires as. PRINCE GELSCHE WALKER KORNDYKE; a son of JULIANA DE KOL, former World Record Cow. There will be daughters of King Hengerveld Segis 8th and De Kol Hartog Pontiac, out of A. R. O. dams.

There are only a few bulls, but they are real herd headers. There will be a son of SPRING FARM KING PONTIAC 6th and out of a granddaughter of DE KOL'S 2nd BUTTER BOY 3rd. A son of TILLY ALCARTRA, the World's Champion milk cow. A son of PRINCE GELSCHE WALKER KORNDYKE, out of a 22-lb. granddaughter of ALTA POSCH'S SON. A few others of exceptional quality.

A Sale of Foundation Stock

This sale will be conducted by COL. BEN A. RHOADES of Los Angeles. For full information and Catalog, write

AUCTION SALE OF JERSEYS

125---Head---125

At the Rancho Dos Rios, Modesto, Cal.

on Saturday, May 6, 1916

The First Public Offering from California's Oldest Herd of A. J. C. C. Jerseys in recent years. This is the first opportunity breeders and dairymen have ever had to purchase, at Their Own Price, Jerseys from this famous herd, which was founded by Adolph Mailliard in 1868.

Practically the Entire Herd of cows at present milking in our herd of Over 400 Head will be sold in this sale to make room for a large number of heifers which will soon freshen. Included in the sale are 40 Registered Animals, carrying a combination of blood lines which trace to the Greatest Dams and Sires of the Breed.

Several Daughters of Dos Rios Pogis, a grandson of Hood Farm Toronto, who has 34 daughters in the list of tested cows, with records varying from 329 pounds butter as two-year-old to 1047 Pounds Butter as mature cows, will be catalogued in this sale. These daughters have been exceptionally heavy producers in our herd and furnish the nucleus of an outstanding foundation.

Granddaughters of Brown Bessie's Golden Gate. This great bull was used as our herd sire for a number of years, being a Son of Recorder and a Grandson of Brown Bessie, the Champion Butter Cow at the Chicago Exposition. He carried 50 per cent of the blood of the great breed leaders, Combination and Brown Bessie, and was a grandsire of the great sire Diploma. His daughters in this sale are outstanding individuals.

Others offered are sired by such bulls as Laura Lee's Isidro, Dorinda Darling's Volco and Rioter Cuba Exile. Many are bred to our young herd sires, Biddy's Valet of L. and Melia Ann's Butterboy Jr.

Breeding of Unregistered Animals in the Sale Is Practically the Same as That of the A. J. C. C. Cattle.

All Stock Tuberculin Tested within 30 Days of Date of Sale.

For Further Particulars See This Space Next Week, or Address

RANCHO DOS RIOS, MODESTO, CAL.

milk cheaper. They must increase its cost. That this increase in cost will, if added to the selling price, increase the cost of living to the consumer, goes without saying. But the consumer has demanded them and he must pay. To do otherwise would bankrupt the producer. Herein lies your greatest remedy against thoughtless legislation. This should be your one main fight, for nothing will make these people careful of the rights of others more quickly than to show them that they will have to pay the bill.

The dairymen in some sections have already formed organizations for the purpose of adding these increased costs of production to their selling price and you and every district in the State should do likewise.

Another reason why you should organize is to see that one of the tests for the approval of a milk inspection department by the State Dairy Bureau, as called for in this law, shall be the adoption of reasonable rules by that inspection department. Recollect that this "inspection department" will have the fixing of the temperature at which your milk and cream will have to be held until it is pasteurized, also the making of the rules and regulations and the fixing of the methods and standards of production and distribution, the cultural and physical examination of yourself and your help. All of these are up to this inspection department. It behooves you to see that they are reasonably and justly fixed. Only by organization can you accomplish this.

The evil effects that this law will produce have already begun to show. There is no rule or method for the marking of butter so that it may be placed in storage and held until after Oct. 1, 1916, and then taken out and sold during the scarcity in the winter months. Hence all of the great over-supply made during the season of good and cheap feed has no place to go, except to be placed upon the market at ruinous prices.

Another evil effect that will soon show up, either from the effect of, or the fear of, the tuberculin test, will be a slump in the price of both beef and dairy cattle. Unquestionably the market will go to pieces.

Again I say you must organize to offset at least some of these evils. Be sure when you do organize, however, that you organize along business lines. Choose for your officers those who have been reasonably successful in their own particular line, and do not expect them to give up too much of their time and effort without reasonable compensation.

A Sale of Noted Jerseys.

Jersey lovers as well as practical dairymen will be interested in the announcement that the owners of the Rancho Dos Rios herd of Jerseys in Stanislaus county are to dispose of 125 head of cattle at public auction early in May.

This herd was established in 1868, making it the oldest herd of registered cattle on the Pacific Coast and it seems needless to say that during that time much of the success of the Jersey breed on the coast, from a production standpoint, has resulted from the efforts of its owners.

For over 40 years the herd was known as the Mailliard herd, but was moved from Marin county to Stanislaus county a few years ago, where the name was changed to Rancho Dos Rios, the ownership, however, remaining in the Mailliard family's hands.

Utility has been the chief consideration in the entire 48 years' work with the herd, the herd sires having been selected with that end in view and as a result the herd contains a combination of blood lines unexcelled, tracing to all of the great dams and sires of the breed.

Because of the vast amount of development work necessary on their Stanislaus county ranch, it has been impossible for the owners to do force feeding for official test work, but private testing has been consistently practiced in late years, and the present offering comprises practically the entire lot selected by that method, from several hundred head.

Owing to an exceptionally large number of young heifers which are about to freshen and a shortage of feed, Manager R. E. Watson decided to hold a public sale, the first from the herd since 1877, expecting in this way to meet the growing demand for the most economical butter producer, at a producer's rather than a fancier's price.

Southern California Holstein Sale.

We are advised by Harlan Dailey, sales manager of the first annual auction sale of the Southern California Holstein Breeders' Ass'n, that their first offering will include some of the finest purebred Holsteins ever sold in Southern California.

Among the offering will be a sister to Aralia De Kol; a son of Spring Farm King Pontiac 6th; Prince Aralia Walker, a son of Prince Gelsche Walker; Arcula Alcartra Sir Korndyke, a son of Korndyke Queen De Kol's Prince; King Pontiac Ormsby Segis, a grandson of the King of the Pontiacs and a son of Tilly Alcartra.

From the above it will be seen that while there are only a few bulls in the sale they are real herd headers and this, with the fact that many of the cows consigned are bred to the above bulls, should make an attractive offering.

Mr. Dailey states that owing to the fact that Southern California is only just beginning to get into the Holstein game, it seems doubtful whether the cattle will bring as high prices as they would if sold farther north in the State and for that reason northern breeders will likely take advantage of the opportunity to purchase quite heavily.

Fourteen hundred head of Merino sheep have just been added to Mr. Strang's ranch near Holtville, Imperial county, and that number will soon be increased to 3500. Instead of having to drive them out of the valley in the summer on account of the heat, Mr. Manning, the foreman of the ranch, states that the shade on the ranch will allow him to keep them all through the summer.

Protection for California Livestock Owners

Having complied with all the requirements of the California Insurance Commissioner, and established general agency connections,

The Montana Livestock & Casualty Insurance Co.

is now ready for business in this State and is prepared to offer safe and sure protection to owners of all classes of Horses and Livestock, (with the exception of stock on the open range).

This Company is safe, sound, and has a reputation for the prompt payment of claims.

Some Facts About the Company that Stockowners Should Know:

The Montana Livestock and Casualty Insurance Company has
—paid-up capital in cash $108,530.75
—surplus as regards policy holders 118,829.07
—paid losses to stockowners during 1915 22,617.50
—the approval of the Insurance Commissioners of California, Washington, North Dakota, Utah and Montana.

Officers of the Company:

EDWIN NORRIS, Ex-Governor Montana - - - President
JACOB MILLS, Capitalist - - First Vice-President
WM. L. HOLLOWAY, Associate Justice Montana Supreme Court, - - - - - Second Vice-President
GEORGE B. CONWAY - - - Secretary and General Mgr.
A. C. JOHNSON, President Montana Life Insurance Co., - Treasurer.

HOME OFFICE: HELENA, MONTANA.

W. H. BROWNING, PROP. WOODLAND, CAL.

KERN COUNTY FAIR ASSOCIATION.

[Written for Pacific Rural Press.]

A co-operative non-profit county fair association was suggested to a well-attended meeting of Kern county Farm Bureau directors March 25 by President Barlow of the Kern county Board of Trade, and was very favorably received by the Farm Bureau.

The proposition is that a county fair association be formed under the special law for that purpose, having for its directors one representative from each of the 12 local Farm Bureau centers, two more from each of the supervisoral districts, the Farm Adviser, the Horticultural Commissioner, the president of the Board of Trade, and Mr. Burke, who managed the Kern county exhibit which won the premium for best collective county exhibit at Panama-Pacific Exposition. An executive committee would be appointed by these. Perhaps a permanent circulating trophy would be provided to go year after year to the best exhibit by a Farm Bureau center. The county supervisors will be asked for $2000 to to be spent on premiums; and there will be a membership fee which will entitle members to free entrance to the fairs, etc.

The old private Kern County Fair Ass'n has 75 acres fenced and a pavilion, which could be leased by the new association.

The fair would probably be held to fit into the circuit following Fresno. The Farm Bureau was also invited to have a representative from each local center, on the Kern County Board of Trade.

SHEEP.

A report has it that all of the lambs from the large Peters flocks in Solano county have been contracted for.

One of Miller and Lux' buyers purchased 200 head of sheep in Sutter county last week at prices ranging from $5 to $7 a head.

Sheep men in the Sacramento valley seem to have their own ideas as to the possible value of wool and are turning down unheard of prices quite often these days.

Jean Sarthou of Tulare county has recently sold over six tons of last year's wool for 21 cents a pound. He has also sold over 1200 lambs from his flock which were wintered in the alfalfa district adjacent to Porterville.

G. K. Swingle, the well-known Shropshire breeder of Davis, says that the loss in lambing with his flock was heavier this year than ever before and that from 250 ewes he won't have much more than a 50 per cent crop of lambs. Thornton Glide of the same place says that while his loss was not so heavy as the above, it was much more than ordinary on account of the bad weather. Altogether it has undoubtedly been a hard season for the sheep man.

HORSES.

The University Farm at Davis has just purchased four grade fillies from the Howard Cattle Co. at Newman, which will be used on the Farm and for demonstration purposes. The mares were sired by a Shire stallion and according to Prof. J. I. Thompson, who purchased them, are good serviceable animals.

DAIRYING.

Dr. Roadhouse of the University of California gave an address at a large meeting of dairymen at Lockeford last week at which time the new State dairy law was discussed.

In the last list of Guernsey cows, comprising 46 records for which Advanced Register certificates are being written, 16 gave over 500 pounds of butterfat each, while six gave an average of over 691 pounds of fat.

State Dairy Inspector Harris T. Nye of Imperial county has filed a complaint against a contractor in that county who has been substituting oleomargarine in the place of butter without posting notices of the change.

F. W. Kiesel of Sacramento received word last week from Dr. Weldon, who is in New York, that he would leave shortly for California with a carload of choice Holsteins for the Kiesel and Weldon herds.

State Veterinarian Keane reports that Post and Card of Corcoran have recently imported 35 head of registered Guernseys from the East and that the Colusa Butter Co. has imported eight head of registered Jerseys.

The Holstein cow Alka Hengerveld Pietertje, owned by the Henderson Co. of Sacramento, has just finished a 30-day official test with 65 pounds of butter. This cow is not yet two years old, having been born April 26, 1914.

The dairymen's ass'n around Wasco, Kern county, which was organized through the efforts of the Kern County Farm Bureau, has developed into an association which is to build a $4,500 creamery and ice plant at Wasco.

M. Tichenor, manager of the Palo Alto Stock Farm at Palo Alto, purchased 51 head of registered Holsteins from the Balfour Guthrie Co. last week. This herd has been maintained at a ranch of the latter named company in Napa county.

The secretary of the Holstein-Friesian Ass'n reports that the cow Fairview Korndyke Pietertje has broken the fat production record in the junior two-year-old division by producing 493 pounds of milk containing over 23 pounds of fat.

The registered yearling Holstein bull Semitropic Anson was bought March 24 from the Semitropic ranch of Kern county by J. W. Jennings of the Ramina ranch, Tehachapi. The deal was engineered by County Farm Adviser C. W. Williams.

Guy H. Miller, owner of the Venadera herd of Jerseys at Modesto, has recently shipped three heifers, sired by Altama Interest, to C. J. Dailey of Ventura. He has also sold yearling bulls to W. A. Eaton of Merced, W. H. Wallace of Emerson and D. Keg of Bodega.

W. H. Donnelsen of Esparto, Yolo county, who is establishing a herd of purebred Holsteins, has purchased the bull Korndyke Ormsby Creamelle from F. Stenzil of San Leandro. This bull is out of the cow Korndyke Ormsby Hengerveld 2nd who has a seven-day record of 28.91 pounds of butter.

At a meeting of dairymen held at Orland March 18, steps were taken toward the establishing of a cow-testing association in that district. Over 450 cows were signed up at the meeting and according to Farm Adviser Heileman there will be little trouble in securing 1,000 head before the association starts work.

The California Central Creameries Co. has secured a contract for 700,000 pounds of butter to be manufactured for the U. S. Navy. Officials of the company say that they will try to fill the entire contract from their Humboldt county plants, but may have to fill in with the product of some of their other creameries in other parts of the State.

Six Guernsey cows have recently finished official test records averaging 450 pounds of fat at the Elliott-Brant ranch. Seven of them were two-year-olds. The cow Princess of Meadowbrook finished a yearly record in March with 725 pounds of butter fat from 14,600 pounds of milk. This company has 21 cows on official test at their Los Angeles county ranch.

SWINE.

Grade hogs are being replaced as fast as possible with purebred Berkshires by G. H. Peters of Bakersfield.

According to the Farm Bureau Monthly of Placer county, there are at least five breeders of purebred hogs in that county at the present time.

B. Suza of Kings county marketed four hogs last week that weighed 2350 pounds, or an average of over 587 pounds, one tipping the scales at 800.

Lippincot and Rich of Lancaster are going into purebred Berkshires on a large scale, having secured most of their foundation stock from California breeders.

The dairy herd of the Craig Farms in Kern county, of which J. H. Osgood is manager, has been disposed of and all energies will be devoted to purebred Berkshires.

Plans are under way for the holding of a hog show in El Centro, Imperial county, sometime in May. A committee is now at work completing arrangements.

F. M. Peterson of Tulare county sold a carload of grain-fed hogs last week for eight and a quarter cents. Hog buyers are said to be scouring that part of the valley for good grain-finished hogs.

Fully 75 per cent of the hog breeders in Tulare county were expected to become members of the Tulare County Swine Breeders' Ass'n by March 25, at which time a meeting was held in Visalia.

Prof. J. I. Thompson of Davis has sent out letters to swine breeders all over the State soliciting consignments to the swine sale which is to be held at Chico the latter part of May.

R. J. Ross of Modesto reports the sale of two Duroc-Jersey sows to M. P. Peck of Merced; 15 sows and gilts to F. T. Knewing of the Oak Knoll Ranch and one service boar to E. H. Cornwall of Modesto.

The rumor is passing among Los Angeles meat packers that some sort of a concerted educational campaign is to be launched in the near future for more and better hogs in California.

Haden Smith of Woodland writes that he has recently sold 23 head of choice Duroc Jerseys, including bred sows, gilts and fall boars. He states that fully 80 per cent of his inquiries come through the efforts of the Pacific Rural Press. That's what they all say.

What is claimed by the Winona Ranch of Grant's Pass, Oregon, as being a world's producing record for purebred sows is the one made by Princess Royal S., who has a farrowing record of 110 live pigs in her ten straight litters, an average of 11 pigs to the litter.

Two purebred Duroc-Jersey boars head the herd of G. C. East and D. H. Graham in Antelope Valley. One is Aneeda Model, of Slocum's Crimson Wonder blood and the other Superdreadnaught, purchased from M. Hucker. The sow Rosemore's Rose was obtained from Elmer Lamb at Ceres.

Ten pigs being fed by Fred Calloway for G. C. Earl in the Antelope Valley averaged 121 pounds at about seven months when put on feed, February 25. When weighed two weeks later, they averaged 37 pounds heavier. Most of them were sired by a purebred Chester White boar purchased from C. B. Cunningham.

C. B. Cunningham of Mills, Sacra-

LIVESTOCK DIRECTORY.

BIG TYPE POLAND CHINAS—One to a carload. Any age, either sex. 600 on hand. They have plenty of size, extra good ham and shoulders, strong arched backs, great length, depth and thickness of body, with good looks as well. Many are sired by IOWA WONDER, a 1000-pounder in show condition. I believe his pigs are the best in California. Visitors say the are the best they have ever seen. He sires the kind that grow faster and larger, have more, better and stronger pigs, and are more practicable and profitable—the kind that are highly satisfactory. Extra special prices on account of being overstocked. I have hogs galore. Prices will surprise you. Satisfaction guaranteed. Write Geo. A. Smith, Corcoran, Cal.

BILLIKEN HERD OF IMPROVED CHESTER WHITES—Everything registered and Cholera Immune. Have two young boars of service size and a few bred gilts to offer. These are extras in every way. Price very reasonable. Have recently received some bred sows from the East that are from Grand Champions and are bred to Grand Champions, from the best and most popular blood lines. Will have an attractive lot of pigs to offer from the coming spring farrows. These will be the equal of any raised in this country. Am booking orders now for same. Write for prices and catalogue. C. B. Cunningham, Mills, Sacramento County, Cal.

REGISTERED DUROC-JERSEYS—ALL AGES—We are booking orders for Spring pigs out of sows sired by full brothers of "I Am Perfection Wonder," sire of Grand Champion sow at Panama-Pacific, and from others equally well bred. Also offering about 30 exceptionally choice fall boars and gilts. This stock is in first-class condition, breeding guaranteed, and of the finest blood in existence. Prices reasonable. For particulars, write, Haven Smith, Route 1, Box 97A, Woodland, Cal.

YOUNG POLAND CHINAS—Large type boar, "I. B. A. Wonder," won first in class and Reserve Champion P. P. I. E. 730 lbs. under two years in breeding condition. Sows bred and sired by "I B A Wonder." Also weanling pigs, either sex. Trios unrelated. None bigger. None better. $15 and up. Will please you or money refunded. W. A. Young, Lodi, Cal.

REGISTERED HAMPSHIRES—Winners at P. P. I. E. Stock of all ages. W. T. Gatton, Box 231, Gardena, Cal.

mento county, states that an effort is to be made by the California Swine Breeders' Ass'n, of which he is president, to secure every hog raiser in the State as a member. In line with this work vice-presidents of the association will be picked from the present membership, one to serve in each county, where local associations will be formed. Mr. Cunningham is a live wire himself and should be able to do a great deal for the swine breeders' organization.

We had the pleasure of visiting the H. L. Murphy ranch near Perkins, Sacramento county, last week, and seeing the herd boar, Rival's Robin 2nd, recently purchased from the Elemdorf Farms in Kentucky. This boar weighs about 650 pounds, but will stand more finish for the show ring. He has an unusually high tail setting, good hams, good depth, is exceptionally broad through the heart and smooth as a whistle. He will look good in the best of company at this year's livestock shows.

The Glenview Ranch at Riverside reports the sale of registered Poland Chinas as follows: one bred sow to Loren Ratekin; one boar to Mack and Ingle; one boar to Sherman Institute; one boar to H. E. Walsh; one boar to J. O. Pyle; one boar to D. M. Martin; one boar to A. W. McCready; one boar to Herbert Crafts; two boars to American Beet Sugar Co.; two boars to Chas. E. Johnson; one boar to Truxton Cannon Indian School; one sow to L. R. Verdin and one sow to A. H. Bobo.

BEEF CATTLE.

H. L. Murphy of Perkins has sold six head of Shorthorn cows to Mr. Hammond of the Hammond Lumber Co., who is establishing a herd near Chico.

Judging by the prices Shorthorn and Hereford bulls are bringing in the East, and the general scarcity even at the high prices, California range men would do well to look around in California for some of the old established breeders.

At a meeting held in Fresno recently, a committee of stockmen were appointed to devise ways and means of bringing about a co-operative organization of stock men, with the hope of improving market conditions. It is thought that stockmen in the San Joaquin valley are not getting all that they should for their stock and that they may be able to improve this condition through a strong organization.

Thornton Glide of Davis reports that he still has about 50 or 60 choice range bulls, ready for service, unsold. He attributes this fact to the cold, hard winter which we have just experienced, stating that the range men have been so busy keeping their cattle alive that they have not had time to get away from home. The Glide Shorthorns have such a justly deserved high reputation that this lot will doubtless be disposed of before another 30 days.

Kern county is to have 7500 acres of rice this year, mostly around Wasco, Rio Bravo, Semitropic, Delano, and Miramonte. It is irrigated from wells.

SWINE.

DUROCS AND BERKSHIRES—Prize stock. Guaranteed. Young pigs, $10 each. One yearling Duroc boar, $20. Write for what you want. We have it. Perkins & Co., Perkins, Cal.

18,000 Hinman Milkers

in daily use, giving perfect satisfaction to their owners and to the cows as well.

J. W. HOLLAND, of Kerman, writes: "Just two years ago I bought my Hinman Milking Machine and have used it **every morning and evening since,** with **perfect satisfaction.** Any one wanting a milking machine should by all means get the Hinman."

GEO. M. WHITMORE, Corning, Cal., writes: "After using the Hinman 3 years, have found it a perfect success in every way. It not only saves a great deal of time and the hard work of milking, but our cows hold the milk longer, and since they have become accustomed to the machines they seemingly do not like to be milked by hand."

POINTS IN FAVOR OF THE HINMAN.

(1) No vacuum tanks.
(2) No vacuum in pail.
(3) Only 2 moving parts.
(4) No complicated pulsating device.
(5) So simple a 10-year-old boy can safely operate.
(6) Low original expense.
(7) Low operating expense.

Free Booklet, "Making More Money with the Hinman Milker."

Productive Feeding OF Farm Animals

F. W. WOLL, PH.D

Professor of Animal Nutrition, University of California.

FIRST EDITION—1915

860 pages; handsomely illustrated. Cloth bound.

Prof. Woll has had long experience in the work covered by his book. Before coming to California a few years ago to take up his work at the University Farm, Davis, he was for years Professor of Agricultural Chemistry, University of Wisconsin. This book in a practical way covers productive feeding from a scientific standpoint. Every breeder of stock needs this work to make a success of his feeding operations.

Price, $1.50 Postpaid.

[Subscribers wishing an immed iate reply should send money order for $1.00. No charge for questions answered through this department. Name and address of subscriber mu st accompany each query.]

SHOULD CUT OFF HORNS.

To the Editor: What can be used to prevent the horns from developing on calves two months old? Must they be sawed off or can a chemical be used?—A. F. G., Concord.

[At this age the horn stubs will have to be cut off.]

HEALING A CUT IN TEAT.

To the Editor: Will you advise me what to do to heal a cut in a cow's teat that goes through into the milk duct? Shortly after she was cut I sewed up the cut and it healed nicely except a hole about the size of a pin through which the milk continues to leak.—F. M. B., Hanford.

[Cauterize the hole with a red hot needle.]

COW HAS TUBERCULOSIS.

To the Editor: I have a cow that has done very poorly since her last calf was born, having a caked bag and giving a comparatively small amount of milk. She has had a cough for about a year. Not bad till recently, but very bad after a little fast walking, also after eating her mash. I had her tested for tuberculosis but veterinarian stated that she did not have tuberculosis. She sometimes slobbers a little, color of which is clear white and somewhat frothy. Advice will be appreciated. R. K. P., Morgan Hill.

[Your cow has tuberculosis. The test was not a true one. Use the intradermal method the next time.]

COW AFFECTED WITH FOREIGN BODY.

To the Editor: Have a cow that bloated a week ago and had to stick her to save her, but have not succeeded in getting her back in shape again. Have given her physic with the usual results, but does not improve her appetite. She seems to grunt every time she expels her breath and has some bloat yet. She almost refuses to walk and does not eat except a little green grass and a small amount of hay. Will not eat grain or bran. What can I do for her?—C. D., Acampo.

[Your cow probably has a foreign body penetrating her vitals and little can be done. Try giving her one dram fluid extract nux vomica, three times a day.]

EXAMINATION OF HORSE NEEDED.

To the Editor: I have a mare that is lame in one front leg. She slipped on the highway about two months ago and I believe sprained her ankle, as that was the first time I noticed the trouble. She limps considerably at times, especially after running out on the range for a few days. The ankle is not swollen, but she invariably stands with that leg somewhat forward. What do you advise doing?—C. M. G., Cloverdale.

[This mare is lame in the foot and a thorough examination of it is necessary.]

HEIFER SUCKS SELF.

To the Editor: I have a heifer that came fresh two months ago. She sucks herself. Is there any cure other than a harness?—W. W. G., Wrights.

[A harness is the only method to stop this trouble.]

OPERATION FOR STRINGHALT.

To the Editor: I have a horse that seems to have stringhalt in the left hing leg, very seldom in the right leg. Is there any liniment that I could use on him that would help him and not hinder me from working him?—C. W. C., Finley.

[Nothing but an operation will help stringhalt.]

BETTER TREATMENT NEEDED.

To the Editor: I dehorned a cow a few days ago and afterward gave her quite a hard run in taking her out to pasture. Now she is falling off in her milk badly. Is there any remedy for her?—Subscriber, Honcut.

[No dairy animal will stand this kind of treatment without showing the results at the pail.]

TEAT CUT WITH WIRE.

To the Editor: About four days ago one of my cows came home with one teat cut half through by a barbed wire. Yesterday she calved and I noticed that the teat was closed. I was told to use a milking tube, which I did. What could you advise me in the matter? — H. H., Sausalito.

[Bandage the teat with several layers of gauze and pine tar. Use the tube but boil it between insertions.]

CREAM WON'T CHURN — HORSE RUPTURED.

To the Editor: I have a cow five months with calf and fed on alfalfa hay. It is always hard to make butter of her cream and now after three hours' churning I have had to give it up. Can you tell me any remedy? I also have a colt that was born with a rupture on her belly about the size of a hen egg. The local veterinarian said it would eventually go away but it has not. What can I do for her?—T. L. D.

[Let your cream ripen longer. An operation is the only means that will cure this rupture.]

PIGS STIFF AND WEAK.

To the Editor: I have some young pigs that are coughing and seem to be stiff and weak. These pigs have been kept in a yard and fed Egyptian corn until within the last two weeks when they have been on alfalfa during the day and fed a little corn in the yard at night. What is the trouble, and what can I do for them?—W. W. D., Arboga.

[Give these pigs good, dry sleeping quarters, free from draughts and plenty of exercise. Place wood ashes and iron sulphate where they can have free access to it.]

ARISTOCRATIC LIVESTOCK DOWN THE PENINSULA.

(Continued from page 411.)

In line with this work official testing will be practiced.

Already the operations on this ranch have had a beneficial effect on the welfare of Ayrshires in California, several herds having been started in other parts of the State, and in years to come the Peninsula may well claim the credit for having instituted a State-wide respect for these hill-climbing cattle.

Holstein Revisions.—So far we have been able to steer our readers through more or less beaten paths, but the complete story of present-day livestock development down the Peninsula does not permit the omission of certain activities which, while hardly far enough advanced

What is Gained by Testing Cows

Testing your cows tells whether they are earning money for you. By the Register of Merit work you can now build up your herd from animals of known production. Science is driving guesswork out of the dairy business. Government records show that the average net profit per cow was increased 129% in eight years by testing. Selection based upon actual dairy merit will produce like results in your herd. Our booklet, "What is Accomplished by Testing Cows," will help you. Send for it now. It's free.

Pedigreed Holstein Bull $250

I am now offering a very fine bull out of a high-testing dam, who was sired by King Pontiac Premier, one of the best sons of King of the Pontiacs, 165 A. R. O. daughters. His dam's present record is 21.09 pounds, average test, 4.11%, made at four years old. This record was made under verw unfavorable circumstances and she will make around 25 pounds with next calf. On the sire's side the bull has the blood of Pietertje Hengerveld Count De Kol, 99 A. R. O. daughters; and dam Deutschland Creamelle, is out of Creamelle Vale, the former world's championship milk cow. This young bull is almost white in color and is ready for service. His high test breeding will count in your herd.

Write or come and see him.

to be certain of success, are of particular interest inasmuch as they show the trend of the times.

We doubt not that readers who were familiar with early-day racehorse breeding have often wondered why the old home place of Governor Stanford, with its natural setting for livestock breeding, has not been utilized for such purposes in later years.

And neither is it strange that men with imagination have decided on that farm as the ideal spot on which to breed Holstein and Guernsey cattle, in equally as pretentious a way as Governor Stanford bred thoroughbreds.

According to M. Tichenor, manager and part owner of the Palo Alto Stock Farm, as it is to be known hereafter, there are to be 600 head of registered cattle maintained on the farm. Already some hundred head have been purchased during the last few months and large purchases will be made both in the East and West in the immediate future.

Activity in development work was only started a short time ago, but already the large winery, with its solid walls of brick, has been transformed into one of the finest dairy barns in the State. That official testing is to be one of the important factors with these herds is shown by the commodious quarters which have been set aside for test cows.

Alfalfa is to be grown in good-sized quantities here also, irrigation water being available in the mountains back of the farm, and already a large acreage has been checked and seeded. This alfalfa, it seems to us, completes the picture of an ideal stock farm, with abundance of green feed below foot and low-spreading oaks generously provided overhead. Surely many a neighbor and traveler will be impressed with the possibilities of livestock for ornamental as well as utility purposes as they pass this farm and it may not be surprising to see dairy cattle become a favored front lawn attraction on the millionaire's estate of the future.

Berkshire Sausage.—However fascinating the subject of dairy cows down the Peninsula may be, the project which will attract most attention because of its uniqueness is the Berkshire sausage enterprise on the Carruthers Farms. As yet this is another of those "going to be" affairs, but the factory is almost completed and those epicures who order artichokes are anxiously waiting for this Berkshire product at their fashionable hotel or club in San Francisco.

Nor is this to be Berkshire sausage in name alone. It is proposed to grind up Berkshires from all parts of the State and sell it in dainty pound cartons. Just why Berkshire sausage is more palatable than that of other breeds of hogs is not set forth, but Mr. Carruthers has hit upon a plan for carrying the name of his favorite breed as well as of his farm directly to the dinner table of his aristocratic neighbors.

Sausage, while the most novel product of Carruthers Farm, is not to be the whole show, but on the contrary it will be a side line, if present plans carry through.

The breeding of registered Berkshires and Shorthorns is to be the main endeavor on the 300 or more acres of land, which is also a part of the Stanford University grounds.

The foundation for the Berkshire herd has been largely purchased from the herd of C. F. Curtiss of Iowa, and with the exception of two or three sows are either daughters or granddaughters of the great Berkshire boar Rival's Champion Best. At present the herd numbers some 75 animals, of which about 25 are brood sows.

Great care has been exercised in choosing the foundation sows as well as the herd sires with the result that one of the finest show herds in the West is to be developed on this farm. Already a good beginning has been made, in the winnings of the herd at San Francisco last fall and this is to be persistently followed up at future livestock shows.

His long connection with purebred beef cattle has naturally led Mr. Carruthers to establish a herd of Shorthorns, small in size as yet but nevertheless to be one of the foundation stones of the farm's future. As herd sire for the Shorthorns an outstanding young bull, Count Glory by name, sired by Count Avon and out of an imported Red Knight cow, has been purchased from the east just recently.

Other purebred enterprises which are well under way in the vicinity of the Stanford University are the Percheron stud of the Los Altos Stock Farm and the Ormandale Stock Farm's herd of recently acquired Shorthorns, thus rounding out a future career for the district in purebred livestock breeding that few sections of similar size can boast of.

As you go further south into the Santa Clara Valley proper you find other herds of livestock being established, but that is another story and has more to do with prunes than millionaires and artichokes.

A sale of purebred Jerseys is to be held during the Butte County Spring Exposition.

HOW TO PACK EGGS FOR HATCHING.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

During the last month I have had some experience with eggs that have been sent by express for hatching purposes. Three separate shipments were sent from farms that had turkey and duck eggs to sell.

One look at the packages convinced me that none of these shippers understood how to pack eggs for hatching; in fact there was not any notice on the packages telling what the package contained, or how it should be handled by expressmen.

In one of these packages there were 75 turkey eggs wrapped in paper, each egg separate and laid on their side in rows, not a bit of excelsior or other packing that would have helped relieve the weight of the top layer of eggs from the lower layer, or from the ground if the box was thrown or dropped down. The consequence was that 24 of the 75 eggs were broken, and those not broken were jarred so that the fertile germ was made very much weaker; and at the first test, ten were taken out as clear eggs.

One hundred duck eggs were shipped loose in some kind of fine stuff resembling sawdust; and out of these 100 eggs, 19 ducks hatched, when really duck eggs are usually the most sure of any eggs in early spring.

One hundred and five turkey eggs were shipped in a non-returnable egg case, about as thick as an ordinary orange box. The eggs were in fillers all right, and had there been plenty of excelsior in the bottom of the case to stand he jar, would have been all right; but there was not a particle of anything in the bottom of the case except the one cardboard flat belonging to the fillers. Quite a number of the lower tier of eggs were broken, but those higher up were all right.

Now in shipping eggs for hatching, the main thing is to secure them against breakage and jarring, as sometimes a jar that does not break the shell will break the germ inside the shell. Of course, this is just as bad as though the shell was broken. In fact, it causes more trouble between buyer and seller than when the evidence is at hand as broken shells.

The very best thing I ever found to prevent jars and breakage in eggs is a good bed of excelsior for the eggs to rest on. In packing baskets, line the basket bottom and sides all around with at least four inches of excelsior, wrap each egg separately in paper, tuck a little excelsior in between, and lay the eggs snugly on the bottom or lower tier. Put a layer of excelsior over that, then a layer of eggs, and crown the package with a good, thick crust of the same material. Then if the expressmen drop the basket or throw something on it, the covering saves the eggs from getting either jarred or broken.

Sometimes it will happen that eggs are injured in transit in spite of all we can do, but when we take precautions that is all we can do, except to try to satisfy a customer.

But in order that the express people may do their part, every package should be labeled, "Eggs for Hatching" in big type, the address of the shipper, and the party they are shipped to, and the value of the eggs in the package written on the address or tag.

All these items are necessary if you are catering to the trade and expect the express company to carry your shipments safely; or if lost or broken, to collect for them.

It is always best to have printed egg labels, but if none are at hand, write out in large letters as follows:

EGGS FOR HATCHING
To Mr. John Doe,
19 Madine St.,
Chico, Cal.
Value $10.00
From:
T. F. Simpson,
Fresno, Cal.

Get your chickens used to a mixture of grains, recommends the University of California, and then economize by feeding a larger share of the variety that is cheapest, but always feed a variety.

Sick Hens.—A letter has been received from a subscriber at Petaluma in which he states that he has some hens that are thin, weak on their hind legs and go about with much effort. Their combs are red and eyes fairly bright. They spend most of their time in a droopy posiion and while they eat they appear to have nothing in their crops.

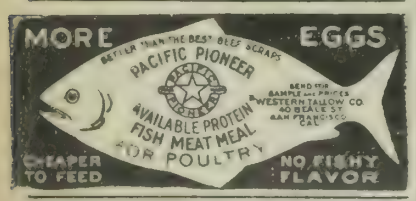
If the combs of these hens were pale I would say they had consumption, as all other symptoms are the same. If they had liver trouble the combs would be more of a purple color than bright red, but if these hens are allowed to live their time out and the disease runs its course I believe the combs will turn pale and they will die of consumption. Better kill them and burn the bodies.

Turkey Troubles.—Another subscriber writes, "My turkeys did fine through the rainy season till last week. One took sick and would not eat or drink, was gasping for breath and rattled in the throat, shaking her head. I gave her turpentine and milk, after which she laid around for a week and then died."

The price of a crate of fowls is usually based on the quality and value of the poorest birds in the lot.

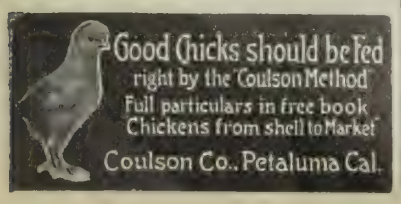
At this season of the year many poultry-keepers are trying to discover why spring hatching results were not more satisfactory. Those who failed to properly disinfect the incubators are seeking a proper method of doing so in future. Others are puzzled regarding ventilation and how to regulate it by observing the shrinkage of the egg. And some are doubtful about the period necessary to incubate various eggs.

VALUABLE POINTERS ON INCUBATION.



[By Geo. H. Croley.]

Disinfecting the Incubator.—Owing to the prevalence of white diarrhoea, coccidiosis, and other germ diseases affecting baby chicks, there is a demand for some positive means of disinfecting the incubator other than washing it with fluids which do not always kill all these germs. The following is a simple and inexpensive method which creates a gas that penetrates every minute crevice and absolutely gets them all; even those that are sometimes carried by dust into the fresh-air flues and other top parts of the machine. Entire incubator rooms and brooder houses may be thoroughly disinfected by this means, if they can be tightly closed:



First carefully close all openings that may admit air into the egg chamber except the door. For approximately every cubic foot of space in the incubator use 1-24 ounce (20 grains or 1 scruple) of permanganate of potash—small crystals—and ⅛ fluid ounce of formalin, which contains 40 per cent of formaldehyde. Place a pan in the incubator containing the potash on which pour the formalin from a cup or other open vessel (never pour from a bottle; it pours too slowly) and instantly close the door. Usually in one hour all germs are killed, but the incubator may be left closed for any length of time. After removing the obstructions and two or three hours of airing, the incubator may be filled with eggs for the next hatch; the remaining odor will do no harm. A much greater quantity of fumigating material may be used, but in that case the machine must be aired for a longer period.

Proper Air Cell. — Beginners should faithfully follow the manufacturers' directions for operating an incubator and then the proper shrinkage of eggs usually follows as a matter of course. But there is much confusion in the minds of many inexperienced operators regarding this feature of incubation, because the normal shrinkage is much greater than expected. The accompanying illustration shows the proper size of the air-space in a perfect egg before placing in the incubator and on the seventh, fourteenth and nineteenth day of incubation. The exact shape of the air-space may vary considerably in different eggs, but the relative size should be as illustrated. This diagram is the result of careful examination of many thousands of eggs, and may be accepted as correct.

Periods of Incubation.—The period of incubation differs in the vari-

California Poultry Practice

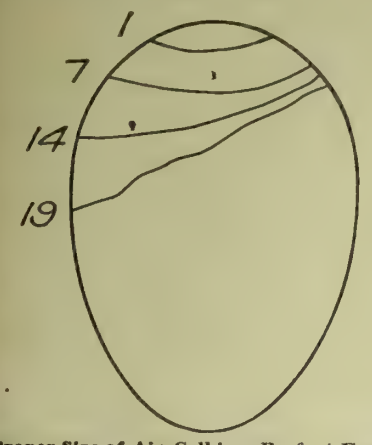
Every poultry raiser of California should have this book. It is very practical and will help make your business profitable. In the preface of the book the author says:

"This book is not an accident; it is born of a desire to help others to avoid the stumbling-blocks in the poultry business, and at the request of many readers of The Pacific Rural Press, and other papers.

"With forty-two years of experience with poultry it is expected that I have learned a few things about it; it's a poor business that does not teach lessons in that length of time. Don't you think so?

"There are books, yes, books without number, on poultry matters, but many of them are mostly theory. This book tells you just what I have done and how I would do it.

"It is a book of action, and it is action that counts these days. We have to act in the living present if we want to live. I want to live and I want others to live, too, and as I have learned these things by experience it is fitting that I should tell others how to obtain results without paying such a big price for the experience.



"The things told you in this book are original, unorthodox, but strictly practical; and if you will read and then heed, you will be well satisfied that the author has given you your money's worth. California is an empire in itself, and I am sure there are enough men and women engaged in the poultry business, or wanting to get into it, to call for a million copies of this book, though its only claim is that it is needed."

The book contains 157 pages, besides illustrations. The 45 chapters cover every phase of poultry culture from eggs to hens, and from hens to market. Feeding, housing and parasites.

Pacific Rural Press, Publishers

525 Market Street **San Francisco, California**

ous species of fowls. The table below shows the normal periods, which may vary somewhat with conditions. The hatch may run one or two days over for the following reasons: When the incubator is run at a too low temperature; excessive cooling; and to the use of stale eggs. On the

Proper Size of Air-Cell in a Perfect Egg.

other hand, the eggs may hatch earlier because the temperature has been too high or the eggs have not had sufficient cooling. If the eggs have been chilled or overheated, continue the hatch but test frequently. Youngsters have been hatched from eggs that have been left out of the incubator all night as well as from eggs which have been subjected to a temperature of over 110 degrees F. for a short time.

DUST CHICKS FOR LICE.

To the Editor: Tell me how to kill lice on chicks that are six to ten weeks old. With 400 or more to treat, handling one at a time is too slow. Is powder or liquid better?—H. L. H., Coachella.

[Answered by Geo. H. Croley.]

[Liquids are not recommended because the fumes stunt the growth of chicks as young as these. It pays to handle each chick carefully and dust it thoroughly with insect powder, repeating in about ten days. Handling them not only insures a good job, but it helps to make them gentle. Timid, frightened chicks seldom grow into profitable fowls. Many failures occur from this cause. It pays wonderfully to make chicks tame, and handling, while young, is the best way to begin. There are machines into which, with insect powder, 20 or 30 chicks are placed at one time. By means of a handle, this receptable is turned like a churn, and in the mad scramble of chicks, the powder is driven into the plumage. Another rapid-fire method is to put the chicks in a shallow box over which stretch muslin. On this cloth place insect powder or air-slacked lime and then beat violently with a lath. This will so thoroughly frighten the chicks, their plumage will more or less "stand on end" allowing the dust to thoroughly penetrate to the skin.]

Fine dust, or moldy earth or straw in the brooder causes great loss of chicks. Use clean sand, burlap, or bright sweet straw.

BEST WINTER LAYERS—PRESERVING EGGS.

To the Editor: Can eggs be added to those already in water glass, and how long will the brine be good? What breed of chickens do you consider best winter layers?—Old Subscriber, Antioch.

[Answered by Geo. H. Croley.]

[Eggs may be added from time to time with fair results, but when possible put down each lot of eggs in a separate container, cover to keep out dust and reduce evaporation, and do not disturb until it is advisable to begin using them. The water glass solution undergoes little or no chemical change and may be saved for future use, but it should be heated and skimmed before using Nearly every breed of fowls has broken records, at one time or another, as winter layers. An English lecturer says, "The variety the owner likes best will be his greatest winter layers because he will give them the most care." In central California, as a general rule, any of the general purpose, or dual purpose, breeds lay more eggs than the small breeds in winter with ordinary care and attention.]

RAISINS PREVENT LAYING.

To the Editor: Do green grapes, raisins, or grape seeds have any effect on laying hens? My hens have been running to cull Malaga grapes this winter and have laid fewer eggs than common with the same kind of chickens fed the same kind of feed.—H. B. P., Clovis.

[Answered by Geo. H. Croley.]

[All of the grape products mentioned will seriously interfere with egg production and sometimes cause hens to stop laying entirely. The buds of the grape vines will also do the same. Tomatoes, tomato peelings, and seeds have a similar effect. In fact almost any acidity in any variety of fruit more or less checks egg production, chiefly because the acid either neutralizes the calcium carbonate, or lime, or prevents its proper assimilation and formation into the egg shell. The hen lays few eggs or none when the necessary supply of material for any portion of the eggs is not properly supplied.]

POULTRY NEWS NOTES.

[By Geo. H. Croley.]

The Cedarhurst ranches report that Indian Runner duck eggs sell better in the Sacramento free market than hen eggs. Their 160 Runners laid 23,000 eggs during the year ending Jan. 30, 1916. They have just received four drakes of the Hurstburger strain imported from Indiana.

Thirteen S. C. Rhode Island Red hens, belonging to Wilbur W. Wright of Auburn, from Jan. 1 to Mar. 1, produced 520 eggs. When set in incubators they tested 97 per cent fertile and hatched 92 per cent. They were fed a scratch grain feed, fed in the litter morning and evening, and the ration was balanced with an egg mash fed dry in hoppers. They also had a constant supply of broken shell, charcoal, and bone in separate hoppers.

Never feed sweet milk and sour milk to the same lot of fowls. Either kind of milk is good, but do not change after the fowls are accustomed to one or the other.

If pasture is available during the greater part of the year, geese can be produced for a less cost per pound of flesh than any other domestic animal.

Poultry Breeders Directory

Rates in this directory, 3c per word each issue; or if carried weekly for one year, 2½c per word.

ALL KINDS OF BREEDING and laying hens, roosters and pullets. Petaluma incubators, new and used. Baby chicks of Brahmas, Orpingtons, Anconas, White and Barred Rocks, Rhode Island Reds, Black Minorcas, Buff, White and Brown Leghorns. Best quality. Prices reasonable. Immediate deliveries. Brown's Poultry Yards, 2550 San Pablo Ave., Oakland, Cal. Closed Sundays.

LIVABLE BABY CHICKS—We are supplied by reliable Breeders and experienced hatchers. Better chicks cannot be had from any source. All varieties, any number. MRS. BEST'S LETTER.

My dear Friends: These beautiful days make us all realize that it really is only a very short time until summer will be here.

To some of you summer brings excessive heat, and it is to you that my talk this week is directed. All of you who have electricity can have electric appliances that not only make your work easier but add greatly to your comfort. Take, for example, an electric fan—why not have one installed and by causing the air to circulate, seemingly keep down the temperature of the house? In the middle west electric fans are run all night in some cases, to help make sleep possible.

Another convenience that no woman should be without is an electric iron. Some of the very best cost less than $5 and they pay for themselves many times over in comfort and the cost of operating them is very small.

The vacuum cleaners are another boon to woman. They almost eliminate sweeping except in the kitchen and porches, and if you wish to purchase the appliances that go with them you can remove all dust and lint from curtains, mattresses, pillows and clothing.

The new vacuum that has the revolving brush to pick up lint, thread, etc., is far superior to the old type, but is also more expensive. I attended a demonstration the other day and the work done was really wonderful.

The machine weighs less than twenty pounds, which is another point in its favor; some of the old style type were too heavy to be lifted or carried around with any comfort.

I wonder how many of you have washing machines that must be run by hand. I saw in one enterprising farm home a machine run by electric motor, and in the same home a motor for the sewing machine, and the mistress of the house assured me it was as interesting to sew with an electric motor as to run an automobile.

Fireless cookers are a convenience that are not dependent on electric current and I hope there are many of them in the warm valleys. Even in cities there are many in use, some families that I know of attending church while the dinner is progressing to completion in the cooker.

There are many dishes such as beans, cereals, rice, stews and dried fruits which require long, slow cooking that are particularly good cooked in a cooker.

Prices range according to size and style and number of openings.

Devotedly, Rosabella Best.

George Washington, Junior.—A farmer who was blessed with a son with an engaging frankness of speech, sent him to the miller's one day. The lad got hold of the miller, and submitted for his inspection a handful of wheat. The miller studied the wheat attentively, and then said to the boy: "How much more has your father got of this?" "He ain't got no more like it," the boy answered. "He's been all mornin' pickin' that out."

Four little kiddoes, happy as can be,
Sitting in a heap of snow, beside a tall palm tree—
Impossible? Indeed not, for all of you can see
That this is snow white cotton, from Imperial Valley.

CAUSES OF COLDS.

The two most common causes of colds are over-eating and chill.

The over-indulgence in meat eating, thereby producing excessive quantities of uric acid, lowers the vital resistance, so that colds are the natural result.

The presence in the mouth of innumerable bacteria, ready for action whenever the system is run down or over-fatigued, makes it necessary to give careful attention to the state of the teeth and throat. An antisepic mouth wash used at night is recommended.

Churches and halls, and even homes, when poorly ventilated, are responsible for congestive colds. If one is so unfortunate as to be continually contracting colds, the first step is to try to overcome the tendency. This can be done by exercising and working in the open air when possible and by using water freely on both the inside and outside of the body. Fresh air sleeping rooms are a wonderful help. Do not overload the body with clothing, but wear enough to keep warm.

VARIEGATED POPPIES.

There is a new variegated California poppy on the market now that makes a most beautiful flower bed. The foliage is just the same as the yellow poppy and the flowers are shaped the same, but range in color from cream and the palest pinks to a deep rose and occasionally a deep bronze one appears. The flowers open in the bright sunshine and make a wonderfully attractive bed. The seeds can be planted any time now and the plants live on through the winter, so that another year, you have flowers very early.

The Name that Fitted.—Little Johnny—"Dad, there's a girl at our school whom we call Postscript." Dad—"Postscript? What do you call her Postscript for?" Little Johnny—"'Cos her name is Adeline Moore."

SMALLPOX VS. CHICKENPOX.

A new and conclusive method for distinguishing between smallpox and chickenpox has been discovered by Dr. Force, who is a member of the medical faculty at the State University.

Dr. Force's method is to take rabbits that have been vaccinated and rendered thoroughly immune to smallpox and inocluate them with material from the doubtful case, and at the same time inoculate with the vaccine for smallpox. If in twenty-four hours a definite reaction of immunity shows on the skin where the vaccine has been applied and no reaction whatever where the material from the suspected case was applied, it proves without a doubt that the suspected case was chickenpox, not smallpox.

This new method has now for the first time been used in public health work and will be of great value to communities and a great blessing to persons who might be subjected to long quarantine, if the nature of the ailment had to be ascertained by the ordinary methods.

SCARLET VERBENAS.

In a ride through the Santa Clara Valley last Sunday, at one of the country homes, I saw a most wonderful bed of scarlet verbena. The flowers occupied a triangular plot of ground adjoining the house and I was told, bloom practically the year round. I was so charmed with them that I want to recommend them to all of you as a very satisfactory flower, doing pretty well under all conditions, but responding wonderfully well to good soil, warm exposure and water. Plants are readily grown from cuttings, from running stems which surface root themselves and from seed. There are many color creations offered, light purple being one of the most popular.

F. A. H.

CONTRIBUTED DATE JAM RECIPE.

By Mrs. P. H. Ralph, Edison, Calif.

Take a pound and a half of dates, one pound of brown sugar, one to two cupfuls of nut meats. Wash and stone the dates, cook in plenty of water till soft and mushy. Add sugar and stir often. When thick enough, remove from fire and add nuts. This is easily and quickly made and is fine for sandwiches.

KEEPING PEOPLE WELL.

Keeping people well is a new profession for women. All who are interested in that line of work will be glad to know that the State University is going to have courses in the next summer session at Berkeley, from June 26 to August 5, along those lines.

There will be training for visiting nurses in school departments, neighborhood nurses whose help can be procured by young mothers, professional nurses, teachers of hygiene and physical education, or social service workers who follow hospital cases and aid the family in removing the cause of illness.

Six well-known California experts are to lecture on "The Social Aspects of Public Health," and Dr. Adelaide Brown (a member of the State Board of Health) is to lecture twice a week on various applications of personal hygiene and public health to the welfare of women and children.

A "first aid" course to teach how to handle emergencies, how to bandage, apply splints, or start artificial respiration and home care of the sick will be given by Dr. Kate Gompertz.

How to prevent the spread of communicable diseases will be taught in a course by Professor John N. Force.

WHITE SKIRTS.

If you want the newest thing in separate white skirts, get a good quality of china silk, using about four widths of 36 in. silk and after turning a deep hem, either pleat it yourself or have it done at a pleating shop in small box pleats. It adds to the appearance to have two deep tucks above the hem, but of course that necessitates more material.

Do not get too thin a silk as the pleats will not stay in. With this skirt, you can wear any dainty crepe de chine or lingerie blouse, and be daintily dressed for almost any occasion. For a wrap over this costume, nothing is prettier nor more appropriate than the Italian silk sport coats made of solid colors, rose, blue, yellow and lavender, with white silk collar, cuffs and sash.

By the way, this material can be bought by the yard and anyone clever with the needle could make a coat at half the price of the ready made ones.

SILK SHADES.

If you have a lamp you want to improve the appearance of, make a new shade for it. You can buy the wire frames and use for a covering any material that appeals to you. A great many are made of China silk, either gathered or pleated and finished with a fancy guimpe or fringe. There are also some styles in petal effect, produced by cutting the silk in form of petals and sewing to a foundation. There are also some made of flowered cretonne and in one very attractive room of a Colonial house the lamp and candle shades were of a figured voile, of the same pattern as the ruffled curtains at the windows.

BY AND BY.

By Mary Bartlett Smith.

ere's a white, white cloud in the blue summer sky,
d it floats very high and far away;
d a boy cannot study, for he's busy all the time
nning what he's going to do by and by.

ere's a white, white sail out across the shining sea,
inging slowly o'er the waves to far-off shores;
d a boy cannot work where the ocean sands lie warm,
r he's dreaming where he'd best like to be.

ere's a white, white road leading over hill and vale,
d a traveller riding swiftly on and on;
d a boy cannot loiter, for the future's far away,
d he's running with the strong who never fail.

ere are white, white thoughts, ever sweet and brave and true,
dden deep where the secrets bud and grow;
d a boy cannot tell you all the Father whispers low,
